(3) As, in general, the boundary waters in their natural state are relatively clear and contain but little organic matter, the best index of pollution now available for the purpose of ascertaining whether a water-purification plant is overloaded is the number of B. coli per 100 c.c. of water expressed as an annual average and determined from a considerable number of confirmatory tests regularly made throughout the year.

SAFE LOADING OF PURIFICATION PLANT.

(4) While present information does not permit a definite limit of safe loading of a water-purification plant to be established, it is our judgment that this limit is exceeded if the annual average number of B. coli in the water delivered to the plant is higher than about 500 per 100 c.c., or if in 0·1 c.c. samples of the water B. coli is found 50 per cent of the time. With such a limit the number of B. coli would be less than the figure given during a part of the year, and would be exceeded during some periods.

(5) In waterways where some pollution is inevitable, and where the ratio of the volume of water to the volume of sewage is so large that no local nuisance can result, it is our judgment that the method of sewage disposal by dilution represents a natural resource, and that the utilisation of this resource is justifiable for economic reasons, provided that an unreasonable burden or responsibility is not placed upon any water-purification plant, and that no menace to the public health is occasioned thereby.

(6) While realising that in certain cases the discharge of crude sewage into the boundary waters may be without danger, it is our judgment that effective sanitary administration requires the adoption of the general policy that no untreated sewage from cities or towns shall be discharged into the boundary waters.

TREATMENT TO SUIT LOCAL CONDITIONS.

(7) The nature of the sewage treatment required should vary according to the local conditions, each community being permitted to take advantage of its situation with respect to local conditions and its remoteness from other communities, with the intent that the cost of sewage treatment may be kept reasonably low.

(8) In general, the simplest allowable method of sewage treatment, such as would be suitable for small communities remote from other communities, should be the removal of the larger suspended solids by screening through a ¼-in. mesh or by sedimentation.

(9) In general, no more elaborate method of sewage treatment should be required than the removal of the suspended solids by fine screening or by sedimentation, or both, followed by chemical disinfection or sterilisation of the clarified sewage. Except in the case of some of the smaller streams on the boundary, it is our judgment that such oxidising processes as intermittent sand filtration and treatment by sprinkling filters, contact beds, and the like, are unnecessary, inasmuch as ample dilution in the lakes and large streams will provide sufficient oxygen for the ultimate destruction of the organic matter.

(10) Disinfection or sterilisation of the sewage of a community should be required wherever there is danger of the boundary waters being so polluted that the load on any water-purification plant becomes greater than the limit above mentioned.

(11) It is our opinion that, in general, protection of water supplies is more economically secured by water purification at the intake than by sewage purification at the sewer outlet; but that under some conditions both water purification and sewage treatment may be necessary.

BACTERIOLOGICAL TESTS.

(12) The bacteriological tests which have been made in large numbers under the direction of the International Joint Commission indicate that in some places the pollution of the boundary waters is such as to be a general menace to the public health should the water be used without purification as sources of public water supply or should they be used for drinking purposes by persons travelling in boats.

(13) It is our judgment that the drinking water used on vessels traversing boundary waters should not be taken indiscriminately from the waters traversed, unless subjected to adequate purification; but should be obtained preferably from safe sources of supply at the terminals.

(14) While recognising that the direct discharge of fæcal matter from boats into the boundary waters may often be without danger; yet, in the interest of effective sanitary administration, it is our judgment that the indiscriminate discharge of unsterilised fæcal matter from vessels into the boundary waters should not be permitted.

* Extract from *Engineering Record*.

BUSINESS AS USUAL.

THE TIME TO ADVERTISE.

A large gathering of advertisers and traders met on Tuesday at the Cannon-street Hotel, London, to discuss the commercial position in relation to the war, and unanimously passed a resolution urging the Press not to relax its efforts to restore the confidence of the public in the stability of trade.

Advocating a campaign of advertising, Mr. Gordon Selfridge said it was the duty of traders, instead of withdrawing their forces of publicity, to make those forces stronger still. Publicity was the material which raised the steam and kept the business of the nation going.

Mr. T. Russell, president of the Incorporated Society of Advertising Consultants, pointed out that there would be a rich reward for traders after the war, and the time to make their goods known was now, and through the columns of the British Press.

A second resolution was passed calling upon manufacturers of branded goods to keep the merit of their productions before the public. "If," said the mover, "a manufacturer stopped publicity the public soon forgot him."

Messrs. D. G. Somerville & Co., Limited, 120 Victoria-street, S.W., ask us to state that they are carrying on their various engineering and contracting departments without interruption at the present time. They have large stocks of iron, steel, and timber, and are experiencing no difficulty in obtaining supplies of all materials.

Waterproofing Materials. Owing to the war there will doubtless be many architects and contractors who, having specified foreign-made materials, will find it difficult, if not impossible, to get such goods. Even if they do get them, there will doubtless be a feeling against supporting the enemy's trade—when the make is Austrian or German. We are asked by the proprietors of Pudlo—the powder which makes cement waterproof—to state that this material is British throughout; every one of its ingredients is British, no imported materials being used in its manufacture. The works are still running as in normal times, and the makers have an emergency stock of many tons, so that there will be no delay in the execution of orders. There will therefore be no necessity for any work to cease because of the difficulty of obtaining foreign supplies specified prior to the war, and it is suggested that those who have previously specified foreign materials should substitute British articles. Messrs. Kerner-Greenwood & Co. also point to the advantages of waterproofed cement as a substitute for Continental asphalts in building work, in view of the difficulty of obtaining foreign materials at the present time.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr. J. S. Pickering, M.Inst.C.E., Borough Surveyor and Water Engineer, Cheltenham.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

J. W. Dudley Robinson, B.Sc. (Lond.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President Mr. Horace Boot, M.I.E.E., M.I.Mech.E.

Meetings will be held at Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

B. Wyand,
Secretary.

39 Victoria-street, S.W.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

CLERK OF WORKS.—August 29th.—Corporation of Walsall. £4 per week.—Mr. H. Lee, town clerk.

SURVEYOR'S ASSISTANT.—August 29th. Uxbridge Rural District Council. £2 per week.—Mr. C. Woodbridge, clerk, 38 High-street, Uxbridge.

ASSISTANT INSPECTOR OF NUISANCES. August 31st. Corporation of Warrington. £78 £125 per annum.—Mr. G. W. N. Joseph, medical officer of health, 78 Sankey-street.

CLERK OF WORKS.—August 31st.—Earby Urban District Council.—Mr. J. E. Aldersley, engineer.

ASSISTANT SANITARY INSPECTOR.—September 2nd.—Nuneaton Town Council. £100—£120 per annum.—Mr. V. Gray Maitland, medical officer of health.

SURVEYOR'S ASSISTANT.—September 2nd.—Corporation of Maidenhead. £80 £100 per annum. Mr. H. E. Davies, town clerk.

HIGHWAY SURVEYOR (Working).—September 2nd.—Bucklow (Cheshire) Rural District Council. £175—£200 per annum.—Mr. George Leigh, clerk, Union Offices, Knutsford.

INSPECTOR OF NUISANCES, SANITARY SURVEYOR, AND SURVEYOR OF HIGHWAYS.—September 5th.—Uttoxeter Urban District Council. £140 per annum.—Mr. Frank F. Hawthorn, clerk, Council Offices, Uttoxeter.

ASSISTANT TO COUNTY SURVEYOR.—September 7th.—Pembrokeshire County Council. £150 per annum.—Mr. Arthur H. Thomas, county surveyor, Haverfordwest.

SURVEYOR.—September 7th.—Okehampton Town Council. £85—£100 per annum.—Mr. J. J. Newcombe, town clerk.

CLERK OF WORKS.—September 7th.—Bedwellty Urban District Council. £3 per week.—Mr. T. J. Thomas, clerk, 36 High-street, Bargoed.

TEMPORARY ARCHITECTURAL ASSISTANT.—September 10th.—Morley Town Council.—Mr. Fred Thackray, town clerk.

ASSISTANT SURVEYOR.—September 12th.—Swansea Rural District Council. £120 per annum.—Mr. E. Harris, clerk, Alexandra-road, Swansea.

ASSISTANT SURVEYOR.—September 12th. Devon County Council. £150 £200. Mr. R. M. Stone, county surveyor (No. 1 Division), The Square, Barnstaple.

BOROUGH SURVEYOR. September 14th. Corporation of Swansea. £500 per annum. Mr. W. Lang Coath, town clerk, guildhall, Swansea.

CHIEF DRAUGHTSMAN. September 30th. City of Westminster. £200—£250 per annum. Mr. John Hunt, town clerk, City Hall, Charing Cross-road, W.C.

ARCHITECTURAL AND SURVEYING ASSISTANT.—Middlesex County Council.—Mr. H. T. Wakelam, county engineer, Middlesex Guildhall, Westminster, S.W.

ASSISTANT ENGINEER.—Nyassaland Public Works Department. £200 £300. Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

BOROUGH ENGINEER AND SURVEYOR.—Corporation of Salford. £900—£1,100.—Mr. L. C. Evans, town clerk, Town Hall, Salford.

ENGINEERING AND SURVEYING ASSISTANTS (4).—Middlesex County Council.—Mr. H. T. Wakelam, county engineer, Middlesex Guildhall, Westminster, S.W.

FOREMAN OF WORKS.—Nigeria. £250—£300.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

INSPECTOR OF WATERWORKS.—Federated Malay States. £180—£280.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

GATESHEAD.—September 10th.—Designs for a school for 700 scholars, for the Education Committee.—The Clerk.

GLASGOW.—September 18th.—Plans for buildings proposed to be erected at the north-west corner of Trongate and High-street. Premiums, £50, £30, and £25.—Mr. J. Lindsay, town clerk.

ST. HELENS.—October 31st.—Drawings of police buildings and fire station, for the St. Helens Corporation. Premiums, £100, £50, and £25.—Mr. A. W. Bradley, borough engineer.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

ESSEX.—August 31st.—For the erection of a handicraft centre, for the Education Committee.—Mr. G. Topham Forrest, county architect, 73 Duke-street, Chelmsford.

ESSEX. August 31st.—For the erection of a new bridge over the river Blackwater, in the parish of Langford, in ferro-concrete (on the Hennebique system), for the county council.—Mr. Percy J. Sheldon, county surveyor, Chelmsford.

LEICESTER.—September 1st.—For the erection of classrooms and additions, for the corporation.—Borough Engineer.

CANNOCK.—September 1st.—For the erection of a school, for the urban district council.—Messrs. Bailey & Solon, architects, Bridge-street, Walsall.

THURNSCOE.—September 1st.—For the erection of a public convenience, for the urban district council.—Mr. T. Bull, surveyor.

STANLEY.—September 1st.—For the erection of an underground convenience and storehouse, for the urban district council.—The Surveyor.

SEDBERGH.—September 1st.—For building three cottages, for the rural district council.—Mr. J. Stalker, architect, 57 Highgate, Kendal.

BRADFORD.—September 1st.—For the erection of forty-five workmen's dwellings, for the corporation. City Architect, Town Hall.

KEIGHLEY.—September 2nd.—For the erection of boundary walls, shelter, and railings, for the corporation.—Borough Engineer.

LLANDUDNO.—September 3rd.—For the erection of twenty-four workmen's dwellings, for the urban district council.—Mr. W. T. Ward, deputy engineer and surveyor.

NORTH RIDING.—September 4th.—For the erection of a school, for the Education Committee.—Mr. J. C. Wrigley, secretary, Education Offices, Northallerton.

RUISLIP-NORTHWOOD.—September 5th.—For the erection of a bridge and [illegible], and reservoir, a rifle range, for the urban district council.—The Surveyor, Council Offices, Northwood.

SHEERNESS.—September 7th.—For the demolition of engine-house and the construction of a new building and other works, for the urban district council.—Mr. F. W. S. Stanton, engineer, 3 Victoria-street, Westminster, S.W.

WEST RIDING.—September 7th.—For widening a bridge, for the county council.—Mr. F. G. Carpenter, West Riding surveyor, County Hall, Wakefield.

GLASGOW.—September 8th.—For the erection of a shelter and convenience, for the corporation.—Messrs. F. Burnet & Boston, 180 Hope-street, Glasgow.

HAMPTON.—September 8th.—For the erection of a police cottage, for the county council.—Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

ILFORD.—September 8th.—For the erection of workshops at the electricity works, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

ILFORD.—September 8th.—For the erection of refuse destructor buildings, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

FARNWORTH.—September 12th.—For the erection of a school, for the Education Committee.—Mr. H. Littler, county architect, 16 Ribblesdale-place, Preston.

EVESHAM.—September 12th.—For the erection of forty-six cottages, for the rural district council.—The Clerk.

HALIFAX.—September 14th.—For the erection of a store shed and alterations to existing buildings, for the corporation.—Mr. J. Lord, borough engineer.

BRADFORD.—September 16th.—For the erection of eight workmen's dwellings, for the corporation.—Mr. F. Stevens, town clerk.

BOMBAY.—January 7th.—For the complete manufacture, erection and equipment of a refuse destructor for the incineration of 200 tons of refuse per day, for the municipality.—Mr. P. R. Cadell, municipal commissioner, Municipal Offices, Bombay, India.

Iron and Steel.

EDINBURGH.—September 8th.—For the supply of 400 tons of 9-in. dry sand cast-iron pipes, for the Water Trustees.—Messrs. J. & A. Leslie & Reid, 12 St. Giles-street, Edinburgh.

MANCHESTER.—September 15th.—For the supply and erection of steel storage shelving, for the Tramways Committee.—Mr. J. M. McElroy, general manager, corporation tramways, 55 Piccadilly, Manchester.

KEIGHLEY.—September 5th.—For the supply of cylinders for reservoir works, for the corporation.—Mr. M. R. Barrett, engineer, Town Hall.

Roads.

BIRSTALL.—August 31st.—For making up a certain street, for the urban district council.—Mr. T. H. Hailstone, surveyor.

CARMARTHEN.—August 31st.—For widening and improving a main road, for the county council.—Mr. G. Henry, county surveyor, Shire Hall, Llandilo.

DOVER.—August 31st—September 1st.—For the supply of Cherbourg quartzite and Guernsey granite, Guernsey chippings, and Guernsey siftings, for the corporation.—Mr. R. E. Knocker, town clerk.

DUNDEE.—August 31st.—For repaving part of Ann-street, for the corporation.—Mr. J. Thomson, city engineer, 91 Commercial-street.

GILDERSOME.—August 31st.—For rolling and scarifying for twelve months, for the urban district council.—Mr. W. Wilby, surveyor.

HARROGATE.—August 31st.—For private street works, for the corporation.—Mr. C. E. Rivers, borough engineer and surveyor.

HAVERFORDWEST.—August 31st.—For kerbing, channelling and paving works, for the corporation.—Mr. W. Bevan, borough surveyor.

PLYMOUTH.—August 31st.—For making up certain streets, for the corporation.—Mr. J. Paton, borough engineer.

SOUTH MIMMS.—September 1st.—For the supply of Leicestershire or other granite, chippings, double-screened hoggin, single-screened hoggin, and 6,000 gallons of distilled tar, for the rural district council.—Mr. G. Simcox, surveyor, "Bearwood," Great North-road, Potter's Bar.

WALLASEY.—September 1st.—For the supply of a 12-ton compound steam roller, for the corporation.—Borough Engineer and Surveyor, 18 Falkland-road, Egremont, Wallasey.

EASINGTON.—September 1st.—For making up and paving certain private streets, for the rural district council.—Mr. G. Waterhouse, surveyor.

LEATHERHEAD.—September 1st.—For the supply of about 300 tons of tar-macadam of hard blast furnace slag of various sizes, for the urban district council.—Mr. Sidney R. Drake, surveyor.

THURNSCOE.—September 1st.—For making up seven streets, for the urban district council.—Mr. T. Bull, surveyor.

GLAMORGAN.—September 2nd.—For the execution of road work, for the county council.—County Hall, Cardiff.

MONMOUTH.—September 2nd.—For improving and widening Llanarth-road, for the county council.—Mr. W. Tanner, county surveyor, Newport, Mon.

HOVE.—September 2nd.—For work in connection with the widening of Hove-street, for the corporation.—Mr. H. H. Scott, borough surveyor.

RAMSBOTTOM.—September 3rd.—For the supply of road and other materials, for the urban district council.—Mr. T. H. Bell, surveyor.

LUTON.—September 3rd.—For the execution of street works, for the corporation.—Borough Engineer.

FRIERN BARNET.—September 3rd.—For kerbing, channelling and making up Alexandra-road (part of), and the eastern portion of Athenæum-road, Whetstone, N., for the urban district council.—Mr. E. J. Reynolds, engineer and surveyor, Council Offices, The Priory, Friern Barnet, N.

RUISLIP-NORTHWOOD.—September 5th.—For making up a private street.—The Surveyor, Northwood.

STAINES.—September 5th.—For road works in connection with the construction of the Metropolitan Water Board reservoirs, for the rural district council.—Mr. G. W. Manning, surveyor, London-road, Ashford, Middlesex.

WALSALL.—September 5th.—For making a road, for the Walsall and Bromwich Joint Committee.—Mr. A. H. Ward, clerk, 22 Lombard-street, West Bromwich.

BRAINTREE.—September 5th.—For the supply of 700 tons of granite, for the rural district council.—Mr. C. V. Bright, London-road, Braintree.

HUYTON.—September 5th.—For the supply of 400 tons of macadam, for the urban district council.—Mr. G. W. Swift, clerk.

MANCHESTER.—September 5th.—For the supply of Portland cement, river sand, gravel and broken stone, for the Rivers Committee.—Mr. Oswald J. Wilkinson, 196 Deansgate, Manchester.

LLANDUDNO.—September 7th.—For work of road construction, for the Joint Committee.—Mr. W. T. Ward, engineer, Town Hall, Llandudno.

SUNBURY.—September 7th.—For the reconstruction of two roads, for the urban district council.—Mr. H. F. Coales, engineer, Council Offices, Sunbury-on-Thames.

SOUTHAMPTON.—September 7th.—For the execution of private street works, for the corporation.—Borough Engineer.

ITCHEN.—September 7th.—For executing works in certain roads, for the urban district council.—Mr. T. A. Collingwood, surveyor.

[illegible]—September 7th.—For the supply of road materials for the corporation.—Mr. F. T. Cropley, [illegible] Surveyor.

ILFORD.—September 7th.—For making up certain roads for the urban district council.—Mr. H. Shaw, engineer and surveyor.

LEEDS.—September 7th.—For laying tramway track in certain roads for the corporation.—Mr. J. B. Hamilton, engineer and manager of tramways, Town Hall.

BRIGHTON.—September 8th.—For the supply of dressed kerb and channel, for the corporation.—Borough Surveyor.

HORNSEY.—September 8th.—For grading and tarpaving a [illegible] for the Hornsey Corporation.—Engineer and Surveyor, Town Hall, High-rd., N.

CLUTTON.—September 8th.—For steam rolling and scarifying, for the rural district council.—Mr. J. S. Drury, clerk, Temple Cloud, Bristol.

WILLESDEN.—September 8th.—For the supply of Norwegian granite, for the urban district council.—Mr. O. Claude Robson, engineer, Municipal Offices, Dyne-road, Kilburn, N.W.

TANGIER.—October 3rd.—For road construction, for the Moroccan Adjudications Commission.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

Sanitary.

SOWERBY.—August 31st.—For the construction of main sewers, for the urban district council.—Messrs. Utley, Hebblethwaite & Utley, 10 Waterhouse-street, Halifax.

ASHTON-UNDER-LYNE.—August 31st.—For one sewage sludge press of large capacity, and one 10-in., and one 6-in. diameter centrifugal pump for pumping sewage, with all suction and delivery pipes, for the corporation.—Mr. J. Rowbottom, engineer, Town Hall.

CHERTSEY.—August 31st.—For laying stoneware socket concrete tubes, and manholes, for the rural district council.—Mr. H. E. Paine, clerk.

SHREWSBURY.—September 1st.—For laying 530 lin. yds. of 12-in. pipe sewer and manholes, for the corporation.—Mr. A. W. Ward, borough surveyor.

TOTTINGTON (Lancs).—September 1st.—For the provision and laying of about 8,060 lin. yds. of cast-iron and stoneware pipe sewers, manholes, and storm-water chambers; also alterations to screening chamber, and tanks, and the construction of sedimentation tanks, percolating filters, humus tanks, sludge beds, channels, and diversion of stream course, for the urban district council.—Mr. L. Kenyon, engineer, Council Offices.

KIRKBY-IN-ASHFIELD.—September 1st.—For the execution of works of sewerage, for the urban district council.—Mr. W. Dodsley, surveyor.

SWANSEA.—September 1st.—For the construction of pipe sewers and surface-water drains, for the corporation.—Borough Engineer.

PLYMOUTH.—September 2nd.—For the reconstruction of a drain, for the corporation.—Mr. J. Paton, borough engineer and surveyor.

HEXHAM.—September 5th.—For the execution of a scheme of main drainage and sewage disposal, for the rural district council.—Messrs. D. Balfour & Son, 3 St. Nicholas-buildings, Newcastle-on-Tyne.

ST. ALBANS.—September 5th.—For works of sewerage, consisting of pipe sewers, manholes, flushing apparatus, gullies, and connections, for the corporation.—Mr. H. Humphreys, engineer, 28 Victoria-street, Westminster, London, S.W.

MOTTRAM.—September 5th.—For cleansing and emptying closets and ashpits, for the urban district council.—Mr. S. Hudson, inspector.

WILLINGTON.—September 5th.—For the construction of sludge beds and drainage, for the urban district council.—Mr. J. H. Gardner, surveyor.

ITCHEN.—September 7th.—For work of surface-water drainage, for the urban district council.—Mr. T. A. Collingwood, surveyor, Woolston.

FARINGDON.—September 8th.—For supplying and laying about 700 yds. of 9-in. glazed stoneware socket sewer at Longworth, for the rural district council.—Mr. H. Glynn Warne, engineer, Faringdon, Berks.

EPSOM.—September 8th.—For scavenging work, for the rural district council.—Mr. W. T. Wooldridge, surveyor.

HEAYDON.—September 8th.—For the removal and disposal of the contents of ashpits, for the urban district council.—Mr. R. Biggins, Council Office.

SHIPLEY.—September 8th.—For construction work at the sewage disposal works, for the urban district council.—Messrs. W. Paterson & J. M. Nicholson, 19 Piccadilly Chambers, Bradford.

RHYMNEY VALLEY.—September 9th.—For the construction of main outfall sewer, about 10 miles long, for the Sewerage Board.—Messrs. Wilcox & Raikes, 9 Victoria-street, Westminster, and Mr. T. J. Thomas, 36 High-street, Bargoed, Glam.

CHEADLE.—September 10th.—For the enlargement of the sewage disposal works, for the rural district council.—Mr. F. T. Inskip, surveyor.

COCKERMOUTH.—September 12th.—For laying 2,000 yds. of sewers and constructing manholes and flushing chambers, for the rural district council.—Mr. J. B. Wilson, Grecian Villa, Cockermouth.

ALEXANDRIA.—December 8th.—For the construction of a sewerage system, for the municipality.—"M. le Président de la Commission Municipale d'Alexandrie," Alexandria.

Stores.

BRADFORD.—August 31st.—For the supply of gas meters, pipes, castings, wrought-iron steam tubing, iron, steel, charging shovels, oxide wiskets, weed brooms, cotton waste, engine oil, cylinder oil, brass main gas cocks, lime, copper lamps, iron lamps, and sheet glass and opal glass for street lamps, for the corporation.—Mr. F. Stevens, town clerk.

ROCHESTER.—September 1st.—For the supply of tools, horse hire, forage, Portland cement, brooms, oils, paving materials, road metal, and coal, for the corporation.—Mr. William Banks, city surveyor.

Miscellaneous.

SOUTHEND.—September 2nd.—For the supply of coal for a period of one year from October 1, 1914, for the corporation.—Mr. Ernest J. Elford, borough surveyor, Municipal Buildings, Southend-on-Sea.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

BARNSLEY.—Accepted for making up two streets, for the corporation.—Mr. J. Henry Taylor, borough surveyor:—
J. Hood, Barnsley.—William-street, £252; Milton-street, £161.

ERITH.—For the erection of a school, for the urban district council.—Mr. H. Hind, surveyor:—

J. W. Ellingham, Dartford	£9,169
L. Kazak, Belvedere	9,169
Friday & Ling, Erith	8,974
G. H. Gunning & Sons, Erith*	8,749

PORTSLADE.—For the construction of main surface-water sewer and outfall works, for the urban district council.—Messrs. Chatterton & Alford, Westminster, S.W.:—

Pilgrim & Son, Limited, Whetstone	£3,660
F. E. Binns & Co., Croydon	3,591
Peerless, Dennis & Co., Limited, Eastbourne	3,467
T. Wilkinson & Co., Poole, Dorset	3,406
E. Iles, senr., Croydon	3,380
D. T. Jackson, Barking, Essex	3,180
H. Farrow, Brixton	3,157
S. Carey, Bexhill-on-Sea	3,034
McKellar & Westerman, Hove	2,769
J. Parsons & Sons, Hove*	2,652

WANSTEAD.—For the Aldersbrook-road improvement, for the urban district council.—Mr. C. H. Bressey, surveyor:—

WIDENING.

W. Jackson, Forest Gate, E.	£1,300
— Blaker, Leatherhead	1,274
T. Adams, Wood Green, N.	1,258

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. SEPTEMBER 4, 1914. No. 1,181.

Minutes of Proceedings.

Town Planning in Practice.

The length of time necessarily occupied in the preparation of a town planning scheme of any magnitude, to say nothing of its execution, coupled with the fact that the Act authorising such schemes was only passed some five years ago, has placed an inevitable limit to the lessons which can as yet be learnt in the valuable school of practical experience. Hitherto there has been a tendency in many quarters to regard a town-planning scheme entirely from the point of view of the benefits to be derived from it, and apart from any adequate consideration of the question of cost. But, as was well said by Mr. F. W. Pearce, the surveyor to the Twickenham Urban District Council, in the paper which he read at the Cheltenham conference of the Institution of Municipal and County Engineers, the Town Planning Act is not, nor was it intended to be, a means of getting something for nothing. The title of Mr. Pearce's paper was "Town Planning Problems in Partially Developed Areas"—a subject with which he is peculiarly qualified to deal, as he is comparatively fresh from the actual preparation of a scheme of this character. The paper raised several very important practical points the first of which in logical order was as to the circumstances under which it is desirable to take steps to obtain the sanction of the Local Government Board to the preparation of a scheme. In this connection it may be said at once that the great public advantages which flow from the increased control over development in an area which is the subject of a town-planning scheme render it generally desirable to undertake a scheme without delay in districts which are actually in course of development. In considering what lands are to be included, two points of difficulty ordinarily arise—namely, in regard to the inclusion of lands in an adjoining district, and of lands already built upon or not likely to be used for building purposes. The first of these matters affords scope for neighbouring authorities to set an example to landowners in regard to co-operation. For the inclusion of the second class of lands, the consent of the Local Government Board must be obtained, and it is for the local authority to show the necessity for their inclusion.

In regard to the provision of roads as part of a scheme, Mr. Pearce pointed to the necessity for consultation between neighbouring authorities as to arterial roads. The question of estate roads, however, is still in the realm of debate. The attempt to include in a scheme a detailed development plan, showing the lay-out of streets and the position of buildings, involves considerable trouble and difficulty and not a little delay, and it is at least open to question whether the benefit derived from this procedure is such as to render it worth while. Among other matters dealt with by Mr. Pearce was that of the burden of the cost of road construction. The general principle which he laid down was that "those who benefit should bear the cost." Few will be found to quarrel with this maxim, embodying as it does an old principle of English highway law, exemplified in the legislation dealing with the execution of private street works. It is one, moreover, for which we have long contended, urging that with the advent of through motor traffic the day of the responsibility of the parish for the maintenance of highways, and of the county for the upkeep of main roads, is past. Equally absurd would be the responsibility of the frontagers for the first cost of modern arterial roads, which benefit the whole community. In regard, then, both to construction and maintenance, we agree with the principle laid down by Mr. Pearce. The chief difficulty arises, however, in devising an equitable scheme for putting the principle into practice—a matter as to which we must reserve what we have to say to some future occasion.

* * *

The Meaning of "Engineer."

"The Connotation of the Term 'Engineer'" was the title of a somewhat novel paper read a short time ago by Mr. W. F. Tyler, ASSOC.INST.C.E., before the Engineering Society of China, and, having regard to the looseness with which that word is frequently used, we are glad to avail ourselves of the opportunity presented by the occasion to offer a few observations on the subject. We are all familiar with the difficulty which occurs in defining any simple object of finding a form of words which will apply to the given object, *and to nothing else*. Similarly in determining what objects or persons can logically be called by a single name such as engineer it must be borne in mind that the members of the class determined upon must possess some common attribute, and that the class must include *all* individuals possessing that attribute. Mr. Tyler points out that the existing connotation of the term "engineer" forms a notable example of a departure from this principle, and he very pertinently asks what are the common attributes possessed by the civil engineer, the mechanical engineer, or the electrical engineer which are not also possessed by the constructive architect and by the ship builder? Some of our readers may be tempted to ask whether any real importance attaches to this looseness of expression, having regard to the fact that almost every person who describes himself as an "engineer" adds by way of prefix some qualifying word, such as "civil," "mechanical," "sanitary," or "municipal," to indicate more definitely the exact type of work in which he professes special skill. To this we unhesitatingly reply that the matter is important for the reasons given by Mr. Tyler. In the first place, a belief is created in the lay mind that there is a greater affinity between the spheres of the several kinds of "engineer" than really exists; and in the second place this belief leads to undue demands

being made on the knowledge of an engineer specialised in a certain branch of work, with perhaps the resulting tendency to undervalue him by the engineer in the next direction.

There is probably no class of engineers which suffers more in this way than that of municipal engineers. The energy of the pioneers made upon their skill and energy has become proverbial. To the individual councillor they are "engineers," and too often are expected to deal in an equally expert manner with matters of sanitation, highway engineering, mechanical, and even electrical work. A consideration of this fact raises the large question of the relationship between the municipal engineer and the expert consultant; but we cannot discuss that matter here. Before leaving Mr. Tyler's paper, however, we should like to quote what he had to say about the history of the word "engineer."

It might have been imagined that in the Middle Ages Satan had a sufficient reputation to need no additional superlative, so it is a very quaint touch to dub him in addition "a great engineer." There are in the English language to-day many such figurative curiosities. For instance, a man may take a great pride in a scheme which he has evolved, but would bitterly resent being called a "schemer." But now comes a more gratifying consideration. The general tendency is for words morally to degenerate in meaning. In the case of the word "engineer," however, we find that the meaning has during the latter half of its career evolved in the opposite direction, until it has now been said to have, in respect to civil engineers, no less a meaning than "the profession which has for its aim the lessening of human evil and the increasing of human comfort for the advantage of the whole world." There could be no greater example of the moral improvement in the general use of a word than this; and no greater tribute to the profession can be found than the sense each, which we can say is the result of the influence of the lives of its exponents.

Professor Blanchard on Bituminous Pavements.

A very useful summary of leading methods of producing bituminous films and bituminous layers of road-crusts is provided in a paper by Prof. A. Blanchard, read at Montreal last May, and reproduced in another part of this issue. In this paper, and in accordance with American practice, the term "bituminous macadam" is applied to grouted crusts, and "bituminous concrete" to crust made by mixing methods. The four definitions are quite clear, except that in the fourth the word "layer" should have been applied instead of "surface." This is a glass house observation, since the words "surface" and "surfacing" are much used in this country to designate layers and even whole crust thicknesses. So far has this abuse of the word "surface" been carried, that it will now be necessary to find another word to designate a surface, and we shall probably have to use the term "superficies." The use of the word "surfacing" for a thin film need not be objected to, since it means "that which is applied to the surface," but it would be better to use the words "smear" and "smearing."

It is interesting to note that Prof. Blanchard considers that Mr. Brodie's method of making a crust with a bituminous-bound upper course provides "the most satisfactory type of bituminous macadam pavement at present constructed in England." In view of the fact that the word "pitchmac" only applies to the wearing layer, unless the word "pitch" is used in both senses, it is worth pointing out that the success of Mr. Brodie's road-crusts is, no doubt, largely due to the fact that the use of adequate thickness, a 4-in. course of bituminous-bound material on a 10-in. lower course of hand-pitched stone, provides a really effective spreading of wheel loads on the subsoil. A type of "bituminous concrete" pavement referred to by Prof. Blanchard as one of the most successful consists mainly of stuff passing a ½-in. screen, 34·7 per cent. a ¼-in. screen, 40·6 per cent. and a 1-in. screen, 17·3 per cent. and Prof. Blanchard believes that an essential element of success in a crust of this type consists in using a crusher product with a "range from 1 in. to 1¼ in. in its sizes." Since only 2 per cent of the metal referred to consisted of stone passing a 1¼-in. screen, and 17·3 per cent that passing a 1-in. screen, his meaning seems to be that the aggregate must contain some considerable proportion of stone of the sizes referred to, but not necessarily a large proportion. Another noteworthy type of pavement described in Prof. Blanchard's paper is made in three courses—the bottom course having a range of sizes 1¼ to 2½, the next layer a range ½ to 1¼, and the top layer ¼ to ½, the pavement being finished with uncoated chips. One would have supposed that in such a road-crust greater stability would be secured by the incorporation of some smaller packing material in the bottom course to prevent the shifting or rocking of the larger stones. As regards Mr Prevost Hubbard's specifications, quoted in the paper, the clause which most deserves the attention of British highway engineers is that in which the load per linear inch of the roller is specified. This clause is not quite satisfactory, since the proper load per linear inch depends upon the diameter of the roller, but it is an important advance on those specifications for rolling which give only the whole weight of the machine.

Work not Charity.

One of the principles laid down by the Cabinet Committee on Distress is that, as far as possible, the relief to be given through the various local committees should take the form of the provision of employment rather than the multiplication of direct gifts. We imagine that, while recognising that there will inevitably be many cases in which relief can only be given in the latter way, most thoughtful persons will be in agreement on this point. The question then arises as to the nature of the public works which can reasonably be undertaken in the peculiar conditions which will obtain. In the first place, it is evident that works of a special kind requiring for their execution a comparatively large proportion of highly skilled labour are unsuitable. The labour to be employed must necessarily be unskilled, most of the men not possessing even the ordinary skill of the labourer with pick and shovel or hod. Nevertheless, it is highly desirable that their labour should be turned in a direction which, if possible, may not only be immediately useful, but even of lasting public benefit. In this connection a letter from Mr. Thomas H. Mawson, which appeared in a recent issue of the *Manchester Guardian*, is deserving of the widest publicity. His suggestion, put shortly, is that this mass of labour should be turned to the laying out of public parks and gardens in and around those large centres of population where distress is certain to be most acute. If land can be obtained, either as a gift or at a reasonable price, the work thus created would go far to relieve distress, not only without pauperisation, but with direct physical benefit to many of the workers by the exchange for the time being of indoor work for the healthy exercise which the use of the spade provides. Mr. Mawson, who is specially qualified to speak with authority on this subject, points out that twenty years ago, during the distress which then prevailed owing to the slackness of trade, a great deal of this sort of work was done up and down the country with the most beneficial results. We cordially

endorse the opinion embodied in his letter and commend the idea to those authorities who are about to undertake relief works.

Salford Council and the Borough Engineership.

In the discussions that have taken place at the Salford Town Council with respect to the scope of the borough engineer's duties it was manifest that there was considerable difference of opinion on the question whether the new official should be in fact as well as in name borough engineer and surveyor. The matter was eventually considered by the Finance Committee according to the terms of reference from the council instructing them to amend a prior report "in the direction of strengthening the borough engineer's position by being made, as far as practicable, the authority through whom the various committees shall exercise their functions appropriate for his supervision." The report upon this reference submitted to the town council by the Finance Committee conferred upon the borough engineer plenary powers, so to speak, with respect to street constructional works, with the proviso, however, that "if required" the officer was authorised to supervise works of construction, reconstruction, or repair. This terminology failed to satisfy the council, which not only, by an overwhelming majority of thirty votes to three, insisted upon the deletion of the words "if required" in the clause dealing with streets, but also struck them out wherever they appeared elsewhere in the report of the Finance Committee. It appears therefore that the town council had finally determined that there should be no doubt or qualification with respect to the nature of the official responsibility to be cast upon the proposed new official, and the town clerk, upon being appealed to at the termination of the proceedings to define the position, gave it as his opinion that the powers of supervision given to the borough engineer "meant actually seeing the work done, being responsible for it, and controlling it." If this, interpreted literally, may imply more than is humanly possible, there is no question that, officially, it suggests a very full life both with respect to the authority and responsibility of the borough engineer.

The Royal Sanitary Institute.

The syllabus for the fifty-eighth course of lectures and demonstrations for sanitary officers which are to be held from September to December this year under the auspices of the Royal Sanitary Institute has recently been issued, and we cordially commend it to the attention of those of our readers who are within reach of the *venue*. The course comprises four lectures on elementary physics and chemistry in relation to water, soil, air, ventilation, and meteorology, seven lectures on meat and food inspection, and twenty-one lectures on public health statutes, the practical duties of a sanitary inspector, building construction, and municipal hygiene, including the prevention and abatement of nuisances, sanitary defects in and about buildings and their remedies, water supplies, sanitary appliances, drainage, refuse removal and disposal, offensive trades, and disinfection. In addition to the lectures, and in connection with them, a number of inspections and demonstrations have been arranged. All the lectures are being delivered by well-known experts in the respective subjects, and although they are primarily intended for sanitary inspectors, much of the ground traversed is of great importance and interest to young municipal engineers. It is pointed out on the syllabus that in preparing for the duties of a sanitary inspector, although a large amount of knowledge can be advantageously obtained in class lectures and demonstrations, a great part of the work of preparation must necessarily depend upon individual study and observation on the part of the student. Concurrently, however, the youthful municipal engineer or pupil should take every opportunity of supplementing his practical work or listening to lectures by experts on those subjects which must closely touch his profession.

* * *

The Aftermath of War.

We have no desire to be pessimistic or to cause needless alarm, but we are bound to draw attention to one of the most serious results that necessarily follow a bloody warfare such as that which is now raging on the Continent within a few miles of our shores, and that is epidemic disease. When we consider the thousands of corpses of men and horses which there is not time to bury or burn, and which must now be strewn over almost the greater part of Belgium and a part of France, we must realise that there exists a grave source of polluting danger to an enormous area. Past history has shown us that very serious epidemics have always followed great battles, and although modern science has been the means of allaying very serious outbreaks of epidemic diseases, it would be useless to disguise the fact that such a danger threatens us, and that we should make strenuous exertions now in the direction of alleviation, if not prevention, so as to be prepared for the worst. Decomposing organic matter is always a dangerous neighbour, and now that we know the active part played by flies in spreading disease, we must not be surprised if before long the horrors of man's war upon man is followed by Nature's inevitable punishment. The duty of every citizen at this time is plain: it is to be prepared, to keep everything as sweet and clean as possible while we have this breathing space, to see that our own bodies are clean and in good health, to see that our water supplies are well protected from possible contamination, and in fact to see that our municipal authorities are doing even more than usual in their fight against epidemic diseases. If this is done we shall be prepared for the insidious foe that always follows on the footsteps of war.

Help to Farmers in Time of War.

Mr. C. F. Gettings, the energetic county surveyor of Worcestershire, is to be heartily congratulated on the scheme he has adopted for rendering assistance to the farmers in his county during this time of peril and stress. Worcestershire—all honour to it!—has responded bravely to the call to arms, and as a result the farmers in some districts found themselves rather short of labour. Mr. Gettings, appreciating the national importance of the harvest being got in as soon as possible, and with the least chance of loss, instructed his divisional surveyors, wherever they found they could do so, to render farmers every assistance in this direction, and, if necessary, to stop the roller gangs for the time being. In this way something like 400 men became available to render their assistance, and the scheme has been found to have been of the greatest use, very good progress indeed having been made with the harvest. This is as it should be. We trust that in every county throughout England the county authorities will do all they possibly can to encourage men to fight for their country, but at the same time be ready to assist farmers and others who might thus become short of labour. We need men in the fighting line to support our gallant little army in the field, and the moral effect alone on our cruel and vindictive enemy would be tremendous if they knew that Great Britain was prepared with a large army of men ready and anxious to avenge those who had fallen in the defence of their country.

Modern Methods of Road Construction and Maintenance.

WHAT MUNICIPAL ENGINEERS ARE DOING.

[illegible] I propose to [illegible] made [illegible] years ago [illegible] have been [illegible] dealt with a large number of [illegible] which it was decided, [illegible] the results of their experience with the methods of [illegible] have been necessary in [illegible] years to introduce modifications in [illegible] purpose of changes in the character of the traffic. A brief statement of facts as [illegible]

BEXHILL.

Mr. GEORGE BAIN, ASSOC.M.INST.C.E., Borough Engineer and Surveyor.

[illegible] and the [illegible] of [illegible] [illegible] [illegible]

also aware that, once the water-bound surface has given place to the new surface, it will be just about as impossible to go back to the old road as it would be to go back to the old system of consolidating the metal without rollers; and they also know that the cost of maintenance will be very heavy, but fully anticipate that this extra expense will not fall upon the local taxpayer.

GOSPORT AND ALVERSTOKE.

Mr. HERBERT FROST, Engineer and Surveyor.

During recent years some of the more important thoroughfares in this district, which previously were constructed as simple water-bound granite macadam, steel roads have been paved in wood blocks of granite asphalt. Outside the town area the main roads have been surface-treated with tar, and granite and hard metal has been used to a much greater extent in lieu of gravel or flint—in other roads, where traffic is at all considerable.

HULL.

Mr. A. L. WHITE, M.INST.C.E., City Engineer.

Since the reconstruction of the tramways for electric working, the tramway routes have been paved with wood almost throughout, and the experience gained has led to creosoted St. Petersburg deal being regarded with increasing favour, and in the case of renewals it is replacing Australian wood, which it has been found to excel in practically every respect. A few additional streets are being paved with granite setts, but in the light of the experience with creosoted wood it is not likely that granite paving will be very greatly extended, and several lengths in front of important offices and council schools have already been taken up and replaced with wood.

For a medium class of traffic granited asphalt is being tried, but it will be some time before it is possible to pronounce an opinion upon it. Tarred macadam has not found any favour except for certain side streets. The corporation have not yet undertaken its manufacture except for patching, and only one or two of the ready-made materials have proved at all satisfactory. This district is fortunate in being able to secure a macadam which loses very little in bulk from wear, but it does not take tar at all well. For the above reasons the idea of using tarred macadam for the principal streets has been practically abandoned, but tar-spraying is regularly carried on. Most of this work is done by a Weeks machine mounted on a steam wagon, but a proportion is also done by hand. Outlying rural roads and culs-de sac are being successfully treated with calcium chloride, and some use has been made of Glutrin. The results with this material have not been quite consistent on the level, but it has been found of great advantage on gradients where tar could not be used. Many other advertised materials and methods have also been given trials, but have not been adopted on any extensive scale.

ILFORD.

Mr. H. SHAW, M.INST.C.E., Engineer and Surveyor.

Owing to the heavy wear on the main roads through this town, it has been found necessary to lay special dressed granite setts on 9-in. concrete bed through the High-road and Ilford-lane at a cost of over £30,000. With regard to the other roads, last summer trial lengths of roads were surfaced with Trinidad asphalt macadam, Tarvia, Mexphalte and Fluxphalte.

MALDEN AND COOMBE.

Mr. REGINALD H. JEFFES, ASSOC.M.INST.C.E., Engineer and Surveyor.

The change in the character of traffic within recent years has necessitated different methods of construction and maintenance of roads in this district. Prior to 1908 most of the district roads were of flint, including also secondary roads. All the secondary roads have now been converted to granite, and are tar-sprayed each year with excellent results.

Wherever any new work of widening is undertaken, either on secondary roads or important district roads, tar slag macadam, costing about 3s. 6d. per square yard, 4 in. thick, is now employed, and this form of material stands the traffic well except in certain cases, where heavy 'bus traffic has caused tracking to take place. In the latter case it is possible that either wood paving or asphalt will ultimately replace the tarmac.

The principal alteration in the form of construction has taken place on the London and Portsmouth road. The heavy traction and motor traffic on this road necessitated a departure from the water-bound method. Tar slag macadam was first tried, but this, unfortunately, did not prove equal to withstanding the very heavy traffic. Trinidad asphalt macadam, 4 in. thick, was then tried, and this method appears to stand the traffic better than any other method yet tried. A length laid down in October, 1910, is still in good order. Pitch-grouted macadam has also been experimented with, a section laid down in August, 1912, having stood remarkably well, notwithstanding the very wet weather experienced during that month. The thickness was from 3 in. to 4 in., and the cost was by no means excessive. A further section of pitch-grouted macadam is about to be undertaken on this road.

PENRITH.

Mr. J. J. KNEWSTUBB, A.R.I.B.A., M.R.SAN.I., Engineer and Surveyor.

Some years ago the question of road construction was carefully gone into at Penrith, and costs were taken as to the formation of roads in ordinary macadam and tar-macadam, and also with regard to their subsequent cost of upkeep, and it was found that, taken over a number of years, and all things considered, there was decided advantage in forming the roads by tar-macadam, or some similar method, as against ordinary macadam. During the earlier stages of construction the formation of roads in tar-macadam was somewhat costly, the upper surface, say to a depth of 5 or 6 in., being taken away and replaced with tar-macadam, but a cheaper and almost as effective a method has been adopted by scarifying or loosening the surface to a depth of about 6 in., screening and removing the fine stuff, and laying the larger gauge material on the site, consolidating this with a steam road roller in a dry state, and then pouring in the interstices a mixture of tar, pitch, &c. On the top of this is laid a coating of tarred stone, varying in gauge and thickness according to the amount of traffic to be borne by the roadway in question. After this has been done a final coating of tar mixture and a sprinkling of dry gravel completes the road for traffic.

Surface dressing on ordinary macadam has been tried, but while in summer this was fairly successful, it was unsatisfactory during the frost and rains of winter.

(To be continued.)

HEALTH WEEK.

EXECUTIVE COMMITTEE'S DECISION.

The Executive Committee dealing with the arrangements for Health Work report that since they were appointed in October, 1913, they have held nine meetings and a number of sub-committee meetings, and the members of the committee and the officers have been actively engaged by correspondence, personal interviews, and circular letters in preparing for the observance of Health Week on the date fixed in November next, both in the United Kingdom and other parts of the Empire.

Their efforts had been so far successful that at a meeting of the committee on July 28th there was submitted to them a list of over 100 towns and districts that had under contemplation the observance of Health Week in some form. Many of these places had their arrangements well advanced, and it was expected that during the following three months many other centres would be arranged. In view of the present circumstances, however, it was decided that it would be necessary to postpone the arrangements for the general celebration of Health Week as originally proposed until the conditions were more propitious. At the same time, the committee consider that in places where other arrangements are so far advanced that the local committee think it desirable to continue, the arrangements should go on; but the Central Committee regret that they will not be in a position to give the material support contemplated.

The committee had before them several suggestions made for redirecting the organisation and efforts of the committee to civil and military conditions arising out of the war; but, although most anxious to afford assistance, there did not appear to be any practical way in which the committee could be of service. It is proposed, however, to have another meeting later on to consider any further action of the committee.

Claridge's Asphalt is being used on the roofs of Preshaw House, Upham, Hants, and Great Oak, Goring Heath, under the instructions of Messrs. Crickmay & Sons and Mr. F. L. Pearson respectively.

IMPROVED ROAD SURFACING IN STIRLING.

By Andrew H Goudie,
Burgh Surveyor and Master of Works

Owing to the increased road traffic it became necessary to improve the methods of surfacing here as in other places.

The first method tried was coating with clean hard metal, and grouting with unrefined gasworks tar. This kept down the dust and acted fairly well as a surface dressing, but in bad weather the tar ran out on the surface, and in cold, wet weather it worked into a black mud, altogether being rather a doubtful improvement on the old methods.

After some further experiments with prepared tar, it was found that the most satisfactory and economical treatment for compartively light traffic roads was to put on a 3-in. coat of tar-macadam, roll hard, and leave it to be consolidated by the traffic, then clean and seal the surface with a thin coat of prepared tar. This gave excellent results on roads with good subsoil which had previously, with ordinary macadam, cost about £75 per mile for a 20-ft. width of road.

In the making of tar-macadam the stones were dried and, where possible, heated, care being taken not to overheat the stones. While hot they were mixed with tar in the proportion of 8 to 10 gallons per ton. The stones were not graded, as I find if the graded stones are not evenly distributed they form a source of weakness in the road. My best results have been obtained from cubical stones broken to pass a 2½-in. ring. The smaller stones can be used for very light traffic roads, and the gravel for blinding or gritting. The tar used was in accordance with the Road Board specification.

Cost of Making Tar-Macadam.

	d.
Metal, 1 ton at 5s.	60·00
Tar, 9 gals. at 4d. ...	36·00
Coal for heating, 4d.	4·00
Wages and carting, 35d	35·00
	135·00

Tar-Macadam Surfacing 3-in. Coat.

	d.
Tarred metal (per super. yard) ..	15·00
„ gravel „	1·00
Wages (per super yard) ...	1·50
Carting „ ..	1·75
Rolling „	·75
	20·00

In addition to the above cost it takes 1½d. per yard to tar-paint and grit the surface of the road.

HEAVY TRAFFIC ROADS.

The real difficulties encountered were on the heavy traffic roads—namely, those costing £200 per mile for a 20-ft. width of road. Before starting to improve the surface of such a road one had to make certain that the bottoming was in good condition, and where the subsoil was weak this had to be treated and made to bear the bottoming, either by draining, increasing the depth of bottoming, or on soft clay putting a heavy coat of ashes below the bottoming. This, when rolled into the clay, stiffens it and improves its bearing qualities.

For treating the surface of such a heavy traffic road something better than ordinary tar-macadam is required. There are in the market various special tars claiming to have a certain proportion of bitumen, but all are fairly expensive.

One of our heavy traffic roads similar to what has been described was surfaced two years ago with bituminous macadam. This was put on from 4½ in. to 5 in. thick, and rolled down to 3½ in., and then blinded with tarred gravel. The surface in summer is admirable, but in the winter months the wear is very heavy, as the protecting surface is torn off by the wheels of the large chars-à-banc and commercial motors. Especially is this the case with a morning thaw after a night's frost, so that when the heaviest wear is taking place the surface from its nature cannot be repaired, and when suitable weather occurs for the repair the cost is all the greater because of the delay.

The tar used was as formerly described, this being mixed with 20 per cent of best Mexican bitumen, and after being down a few weeks it was surface-coated with the same mixture and gritted with hard whin chips.

Three different qualities of stone were used, one being a hard, keen stone standing a great crushing strain, one a good hard whin, but not so keen as the first, and the third a good moderate whin. It was found that the keen stone had not taken a proper grip of the tar, and the suction of the motor wheels tended to bare this stone by removing the particles of tar which in the cold, damp weather had become pulverised by the heavy traffic. The medium stone held the tar better, and the softest stone best of all. This roadway was again surface-painted in the following summer with tar and bitumen as formerly, part being coated with proprietary bitumen which did not give such good results.

Cost of Bituminous Tar-Macadam.

Part of this same heavy traffic road was surfaced with Rocmac at the same time as the remainder was surfaced with bituminous macadam. The part chosen for the Rocmac was between high banks and overshaded with trees. This portion of the roadway has proved slightly dusty in summer, but not so dirty in winter, and has the great advantage of being repairable in almost any weather. The cost is a little cheaper than bituminous macadam, and it has the further advantage of not requiring an expensive paint with a bituminous mixture every summer. It has a hard, metallic surface, but gives a good foothold to horses, and has less resistance to traction than bituminous macadam. For cost of upkeep it certainly compares favourably with the bituminous macadam, although it has been placed in the worst part of the road.

Proposed Improvements at Scarborough.—An extensive scheme of development on the North Side was indicated at the meeting of the Scarborough Town Council in committee recently. The Estates sub-committee put forward a number of recommendations. The most important of these was the proposal to construct a bathing pool on the North Side. The site of this pool is to be immediately south of the Peasholm slipway. It will be similar in shape to the one on the South Side, and will be formed immediately under the sea wall. The estimated cost is about £10,000. It is also proposed by the sub-committee to erect twelve more bungalows, on the crescent-shaped site immediately above the present bungalows.

Town Planning Problems in Partially Developed Areas.*

By FRED W PEARCE Engineer and Surveyor to the Twickenham Urban District Council.

Since the passing of the Housing, Town Planning, &c. Act 1909 the subject of town planning has formed the most frequent subject of discussion at various conferences of local authorities and other bodies, and nearly all possible phases have already been dealt with in the various papers which have been read on such occasions.

With comparatively few exceptions, the papers submitted to the Institution have been mainly confined to the question mainly from the theoretical side, owing to the limited extent to which practical experience in the actual working of the Act was available. The consideration of the subject in connection with the actual preparation of a town planning scheme involves many difficult points, and I propose briefly, from the point of view of my own experience, to probably serve a useful purpose to enumerate briefly a few of such problems in the hope that the considera- tion and discussion of such problems may be of some assistance to those charged in the preparation of town planning schemes.

DESIRABILITY OR OTHERWISE OF PREPARING A TOWN PLANNING SCHEME.

The first of such problems in point of order is the desirability or otherwise of taking steps to obtain the sanction of the Local Government Board to the preparation of a scheme. . . . This can only be decided after full consideration of all the aspects of the matter as affecting the particular district. In all cases, however, where there is any considerable area of land in course of development, or in respect of which there is any probability of development taking place within the next ten or twenty years, a *primâ facie* case for the preparation of a scheme may probably be considered to exist. In such cases it will, no doubt, be conceded that the advantages to be derived in securing a larger measure of control in the development of the district are ample to justify the expenditure which the authority may thereby be called upon to incur. In fact, the general adoption of the Act by all local authorities of districts in course of development may be regarded as fairly certain within a comparatively short period.

NATURE AND EXTENT OF LAND TO BE INCLUDED.

Having decided to prepare a scheme, consideration must next be given to the actual area to be included, and as to the advisability of including land outside the area of the local authority, and lands already built upon or not likely to be used for building purposes. . . . In the case of the Twickenham town planning scheme, lands within the area of three other local authorities—two of which are situate on the opposite side of the river Thames—were included in the original application. As the result of negotiations which subsequently took place, each of such local authorities agreed to prepare a town planning scheme for their respective areas, with the result that the districts of Richmond, Heston and Isleworth, Ham and Twickenham, all of which abut in part on a portion of the river Thames, have applied for authority to prepare schemes in respect of a total area of approximately 9,200 acres. While the circumstances are, in this instance, probably somewhat exceptional, there are no doubt numerous other cases in which a similar course of mutual action on the part of neighbouring authorities will afford the best means of preserving the amenities of, and securing the most effective method of development for, the respective districts.

The extent to which it may be necessary to take advantage of the provisions of sec. 54, subsec. (3), with respect to the inclusion of lands already built upon or not likely to be used for building purposes requires careful consideration. As a general rule, the advice "when in doubt include" may be recommended for acceptance. It must not be overlooked, however, that the inclusion of such land is subject to the consent of the Local Government Board, and that the onus of proof as to the necessity for such inclusion will rest upon the local authority. In cases where the character of the district is undergoing any appreciable change, such as the demolition of existing buildings and the erection of buildings of a different class, the inclusion of considerable areas of land already built upon may be of [illegible] as, in the event of

* Paper read at the Annual General Meeting and Conference of the Institution of Municipal and County Engineers at Cheltenham.

this not being done, large buildings standing on land of an acre or upwards in area may be pulled down, and a number of small buildings crowded on the same area. In fact, the value of the land for this purpose may be substantially increased by the inclusion in the scheme of the undeveloped land in the district.

ROADS PROPOSED TO BE MADE AS PART OF THE SCHEME.

In cases where the construction of new roads as part of a scheme is necessary or desirable, either for the purpose of improving means of communication or assisting in the general development of the district, the planning of such roads must necessarily be the first problem to be considered, as various other problems will depend largely upon the line and direction of [illegible] roads, and the purposes they are intended to serve. The lines of what have hitherto been described as arterial roads will require the first consideration, and will necessitate a large measure of intelligent anticipation with respect to future traffic development. Consultation with the adjoining local authorities is also essential, and much careful sifting of the various points for and against any arterial road, and the suggested line of such road, will be necessary in order to arrive at a solution which will most efficiently meet the probable future traffic requirements, while at the same time inflicting the minimum amount of present inconvenience and probable pecuniary loss. . . .

It would be impossible in a paper of this description to deal with the various points which must of necessity arise in a problem of such magnitude; but it may be suggested that, in cases where the construction of a new road for the purpose of effectively dealing with traffic passing [illegible] large [illegible] population would involve the diversion of such traffic from an existing business centre, it should be made a condition that no trade or business premises be allowed to be erected along such line of road. Not only would such a condition serve to reduce the possibility of hardship and pecuniary loss to existing traders, but the primary object of a through traffic road—viz., the provision of improved transport facilities—would be enhanced by the elimination of the obstruction so often created in important thoroughfares, by reason of slow-moving traffic and the loading and unloading of goods outside business premises.

The next point for consideration is the planning of roads intended chiefly for local intercommunication or linking up the various parts of the area. In most districts natural or artificial barriers exist, such as rivers, canals or railways, which render intercommunication difficult, and under existing methods of development this difficulty has even been accentuated by the haphazard method in which new streets have been laid out. It should be one of the chief objects of a town planning scheme, particularly in partially developed areas, not only to lay out such new lines of roads as will reduce, so far as practicable, the inconvenience which is inseparable from the existence of such natural or artificial barriers, but also to reduce the number of culs-de-sac, which are so common a feature of many suburban districts.

This question is essentially one which should be approached, at any rate in the early stages, without any undue stress being placed on the question of initial outlay. To secure satisfactory results, bridges may have to be constructed and existing buildings pulled down; but the town planning enthusiast who expects to make bricks without straw will be sadly disappointed.

Having decided upon the lines of roads which are necessary for either of the purposes already indicated, the question of what may be described as estate roads remains for consideration. The extent to which it is desirable to prepare an actual development plan, including the lay-out of streets and the position of buildings, is a matter upon which there is probably some difference of opinion. It is suggested that, in most cases, however, the attempt to include detailed planning of this description would cause much unnecessary delay in the preparation of the scheme, and that the result obtained would be in no way commensurate with the troubles and difficulties which would thereby be involved.

ROAD CONSTRUCTION AND COST.

The method of road construction, and in what way the cost of such construction should be dealt with

should be taken into consideration. The . . . principal . . . matter . . . be dealt with as and when the occasion arises, or, if . . . as to be necessary in connection with the . . . the . . . such roads may be constructed of the ordinary by-law width, with . . . and material rights on one or both sides to provide for future widening. In the case of roads, . . . which are necessary for opening up and improving intercommunication within the district, provision for the early construction of such roads is desirable in order to secure the immediate advantages which should accrue to the district from a well-designed scheme. This could, in most cases, be ensured by the inclusion of the necessary provisions to . . . the . . . to be carried out by the local authority, either on their own initiative or at the request of the owners of the land across which such roads are intended to be constructed. In the case of these roads also the initial width should be governed by the general road conditions, subject to a similar provision to that in the case of arterial roads for future widening. In the meantime, full advantage should be taken of the opportunity to deal with the land, not actually laid out as carriageway or footways, in such a way as to add to the amenities of the district. . . .

PUBLIC AND PRIVATE OPEN SPACES.

It is doubtful whether any useful purpose would be served by any attempt to lay down any general rule as to the area of open space which should be provided, or as a comparative standard, one-fifth of the total area may be suggested, of which one-fourth may be allotted as private and the remainder as public open space. The relative proportion of these two classes will, however, depend largely upon the character of the district, and the method of administration adopted in connection with the future upkeep and maintenance. . . .

The location of open spaces should be such as to secure reasonable facilities for access, and to preserve the general amenities of the district. The first of these objects suggests the desirability of providing open spaces, particularly playing fields, in close proximity to the principal lines of communication, and should therefore be considered in conjunction with the planning of any new roads proposed to be made as part of the scheme. The second object involves the preservation, so far as it may be practicable, of objects of natural beauty, and attention may again be directed to the desirability of protecting rivers, brooks and streams, by the retention as open space of strips of land along the banks. In addition to parks and playing fields, adequate provision should be made for children's playgrounds placed in close proximity to their homes, and away from the main arteries of traffic. . . .

LIMITATION AS TO NUMBER, HEIGHT OR CHARACTER OF BUILDINGS TO BE ERECTED.

It is essential that very careful consideration should be given to the allocation of purely residential areas, and to the extent to which the limitation of the number of houses to be erected can be fairly applied. Even where this has been done it will probably be found impossible to meet the objections of a certain number of owners, but these may safely be left to be dealt with by the Local Government Board. . . . It would, however, probably serve to remove a number of objections if consent could be obtained to the insertion in the scheme of provisions for securing alteration or revision of the limiting provisions, should this be subsequently found necessary or advisable, in consequence of any material alteration in the circumstances or conditions which existed at the time when the scheme was originally prepared.

In addition to the limitation of the number of buildings to be erected to the acre, it is desirable to provide that only a definite portion of the site shall be covered with buildings, and that such buildings shall not be used as tenements except in compliance with special restrictions with regard to number of tenements, with a further restriction, if considered advisable, as to the number of buildings to be allowed if divided into tenements. It may also be advisable to require a minimum area of site for each building, and to limit the height of the buildings to be erected.

Closely connected with the location of residential areas is the provision of suitable business centres, including such shopping facilities as may be necessary for meeting the daily needs of the locality. . . . The only safe plan, apparently, will be to provide well-defined shopping centres, and to keep the residential areas entirely free from any kind of trade or business premises.

The allocation of sites for factories and workshops will almost entirely depend upon the character of the district, and the nature and extent of any trade or manufacture connected therewith. The necessity for adequate transport facilities must, however, be borne in mind, and land adjoining railways, rivers and canals will naturally be selected as suitable sites for such purposes. In the case, however, of land adjoining natural rivers or streams, the effect upon the amenities of the district should be carefully considered before definitely allocating any of such land for purposes of trade or manufacture. . . .

ESTIMATED COST OF CARRYING OUT THE SCHEME.

The importance of careful consideration being given to the question of probable expenditure is clearly indicated by the provisions of Article XVI. of the revised Procedure Regulations, which require, in connection with the application for approval of a scheme prepared by a local authority, that separate particulars of the estimated cost of carrying out the scheme should be given under the following heads:—

Expenditure.—Purchase of land for open spaces; purchase of land for other purposes; purchase of buildings; demolition or alteration of buildings; compensation in respect of property injuriously affected by the scheme; making or alteration of roads or ways; sewerage or drainage; cost of preparing the scheme; other purposes.

Receipts.—In respect of all property increased in value; from other sources.

It is, of course, probable that a scheme may not necessitate expenditure under each of such headings, and it is also a fair argument that expenditure under such headings as sewerage or drainage would be necessitated in connection with the development of a district, independently of any question of a town planning scheme. After making full allowances, however, in respect of such circumstances, the question of cost will remain as one of the most important items in connection with the scheme, and in dealing with any considerable area there is little doubt that the effective value of a scheme will bear a direct relation to the expenditure incurred.

On the other hand, it does not necessarily follow that estimated expenditure will become immediate actual expenditure. In most cases the provisions contained in a scheme will come under two distinct headings, one of which will include provisions operative within a certain time, on the part of the local authority or the owner of the land, and the other, those which are to a large extent permissive and only require works to be executed in a certain way if executed at all.

There is the further probability that some portion of the estimated expenditure will be conditional upon the nature and extent of the development of the district, and might, therefore, be regarded as to some extent provided for by increase in rateable value. Such considerations may fairly be taken into account, and it would probably serve a useful purpose to approximately allocate the estimated expenditure for periods of, say, five, ten, fifteen and twenty years.

A short discussion followed the reading of the paper at the recent annual meeting of the Institution of Municipal and County Engineers at Cheltenham.

Mr. E. Willis (Chiswick) said he believed in compulsory town planning, seeing that there were so many local authorities where the members had vested interests, and where undoubtedly they would like to do good work, but where they felt that their own interests, or those of persons dear to them, would be seriously affected, with the result that they hesitated before they adopted the provisions of this important Act. Therefore the time had come when the Government should give a limited period for the adoption of the Act, and make it, or some modification of it, compulsory within three or five years. If that were done there would be good hopes of the country getting some good results for the future. He did not suggest that fully complete schemes should be made. Let preliminary plans be made showing the area, so that the local authority had some power over the development of the land. With regard to the inclusion of large areas of urban authorities, Mr. Pearce had admitted that his authority had made a mistake. It was a rather serious matter if a new arterial thoroughfare was to be allowed to take away the trade of an old arterial thoroughfare, and therefore, in dealing with new arterial roads, there should be some pro-

vision which would prevent roads being set up in opposition to those that had led the trade. In the country we were not called upon to deal with skyscrapers of the New York type, but special provisions were needed to govern the height of buildings. He proposed a vote of thanks to the author of the paper.

Mr. H. E. SELCOE (Birmingham), who seconded, advised authorities not to exclude any area from their town planning schemes. He was sorry that any portion had been excluded from the Birmingham scheme.

Mr. A. J. REDFERN (Hendon) said he had in his district villages where, when he purchased a new outlet and one or two sewers for the sewage works, it increased the rates. When a 1d. rate would only bring in £200 a year, they would see the extreme difficulty in the way of a surveyor of a district council suggesting that money should be spent on town planning.

Mr. H. G. WHYATT (Grimsby) said the Local Government Board, in a scheme with which he was acquainted, had allowed the compulsory purchase of all unbuilt-on land, but they refused to give power over the whole district, or to prevent villas being turned into factories.

Mr. F. J. SMILLIE (Tynemouth) remarked that, to say a town planning scheme must be mandatory as compared to the Local Government Board's present time was to retard the whole movement.

Mr. T. ADAMS (Local Government Board) said he could assure them that in considering Mr. Pearce's scheme he spent days in trying to solve the problem which houses he should include and he thought Mr. Pearce, in his generous proposals, would admit that the board included as much as possible. Mr. Pearce's point was that if a scheme were worth having, an endeavour must be made to share the cost of carrying it out. Any scheme, to be of value, must cost an authority something as well as put some restriction on the owner, but the cost would be spread over a period, so that the authority would not feel it.

Mr. J. A. ANGELL (Beckenham) considered that in the suburbs of London town planning should be more or less compulsory. The suburbs were in competition with each other, and when one district took on a scheme the objection raised by ratepayers was that they were about to impose restrictions on houses which would raise the rates and drive out people who would otherwise live there. The Local Government Board might very well give a lead as to the number of houses per acre.

Mr. PEARCE, in reply, explained that his authority, after preparing a town planning scheme, allowed building to go on subject to the owner acting in accordance with the council's views. In this period of transition it was necessary to meet the owners as far as possible.

MAINTENANCE OF BELFAST STREETS.

COST OF CLEANSING AND REPAIR.

The provision made for the repair and cleansing of the streets of Belfast and for the carrying out of improvements by the works department of the corporation during the year ended March 31st last is dealt with in the annual report of the superintendent of works (Mr. Hector F. Gullan, M.INST.C.E.), who states that in the course of the year 3 miles of streets were added, making the total mileage of public thoroughfares throughout the city 309 miles, including, in round figures, 144 miles of pebble-paved carriageways and back passages, 25¼ miles of sett-paved carriageways, 135 miles of macadam, 1 mile of wood paving, 3¼ miles of tar-macadam, and 30 yds. of asphalt.

The estimated expenditure on general repairs for the year was £30,000, and the actual expenditure £28,915. The cost per mile was £93·64 as compared with £118·07 ten years ago. For street cleansing the estimated expenditure was £31,950, and the actual expenditure £30,877. The cost per mile was exactly £100, as compared with £120·86 ten years ago. The total number of street cleansings amounted to 345,272, which constituted a record, being 1,679 over the highest previous total. The number of loads of sweepings removed was 87,823. Upwards of 23,000,000 gallons of water were used for street watering, and the average daily staff of men employed was 322.

Llansannan Waterworks.—The Local Government Board have sanctioned the borrowing of £1,000 for new waterworks at Llansannan, near Denbigh, and the work is to be put in hand after the harvest.

SHOULDERS FOR CONCRETE ROADS.

By W. W. CROSBY, Baltimore, Maryland.

[Mr. Crosby, in a letter dated August 18th, states that he has read with great interest the editorial on "The Edges of Road Crusts" in our issue of August 7th, and forwards for publication the subjoined report prepared by a committee of which he is chairman and presented at the National Conference on Concrete Road Building held recently in Chicago.]

With the almost universal tendency in concrete road construction to keep the width of the concrete as low as practicable, in order to reduce the first cost (per mile) of the improvement of a road, has come, in many cases at least, the neglect of proper consideration of the matter of shoulders. In many cases the neglect referred to has unquestionably resulted in extravagance and waste in the long run, even if it has secured economy in first cost.

While authenticated records covering reasonable periods and concerning the relative expense for the proper maintenance of road crusts and of shoulders respectively are not readily available, certain instances of such record are published concerning Park Heights-avenue, near Baltimore, Maryland),* together with the individual experiences related by many authorities, tend to show that the shoulder maintenance costs may be no inconsiderable part of the total maintenance costs of a modern road, and that it may often be real economy to build the road crusts wider in order to reduce this annual expense for maintaining the shoulders, and thus the total maintenance cost per square yard. From the Park Heights-avenue records, above referred to, it may be seen that, although the travel over the 24-ft. wide sections was four times that over the 12-ft. and 14-ft. sections, the cost of maintenance per square yard of the road crusts of the latter was more than twice that of the crusts on the wider sections, and the cost of maintenance on the shoulders on the narrower sections was nearly three times that for the shoulders along the wider crusts. Indeed, the economy in maintenance on both the shoulders and road crusts of the wider sections indicates that, in a ten-year period from the date of construction, real economy would have been had by increasing the width of the road crusts so that nowhere would the latter have been less than 18 ft.

But the subject for consideration is not "The Economical Widths of Road Crusts," but "Shoulders for Concrete Roads," and after the above specific illustration of the importance of shoulder consideration that of the actual subject may be resumed.

The actual width of the concrete roadway to be built must be determined by the traffic conditions to be expected on the road, and if these are sufficiently heavy to warrant so doing, it will probably be economical often to make the concrete itself wide enough to permit the passing of two lines of traffic wholly on its surface and without any necessity for either of passing vehicles to travel off the concrete on to the shoulder. On the other hand, traffic and other conditions may be such as to permit the greatest economy to be had by making the concrete only wide enough for one line of traffic and allowing the occasionally passing vehicle to travel on the shoulder for the moment.

The immediate vicinity of the line of contact between the edge of the concrete and the shoulder material will be found to be the tender region of both the road crust and of the shoulder. The high rigidity of the concrete road, and consequently the greater contrast between such a road crust and other material usually available for shoulders, increase the importance of the careful consideration in the matter.

Where the concrete road crust is so narrow that vehicles are almost constantly, in avoiding others, passing from the concrete to the shoulder, serious wear of both the road crust and the shoulder will be found to take place along the region of contact referred to, and this wear is frequently accompanied by the formation of a rut in the shoulder, which holds water in wet weather and thus endangers the foundation of the road. Some of the passing traffic will undoubtedly turn out on to the shoulder further than the rest, but at the extreme outside of the shoulder the travel over it may be so light and infrequent that the natural material there is not strained beyond what might be called "its elastic

* "Proceedings," American Society of Civil Engineers, Vol. xxxix., No. 7, page 1706, &c.

material and methods for the construction of [illegible] extremes, and the concrete itself; that the choices are determined by local conditions, such as availability of different materials and methods, width of [illegible] and that the wearing abilities or "elastic limits" of [illegible]

The passage of traffic from the pavement to soft [illegible] vented, and the protection of the edges of the pavement be had by the installation of a raised edging or kerb, as in the cases of most streets. The necessary reinforcement of the shoulder where no raised kerb is to prevent traffic on it may be had in various ways. One would, of course, be to widen the concrete road crust to such an extent as to preclude [illegible] the centre thickness of the crust need not necessarily be preserved to its edges, but the thickness may be tapered down somewhat at the outsides. Or this widening (and tapering down in thickness) of the road crust may be done over a portion of what might otherwise be the shoulder, and then the reinforcement continued by the use of macadam or pit-gravel or other materials as may be necessary. Again, the width of the concrete road crust being fixed, the shoulder reinforcement may be had by the construction of pitch-concrete, pitch-macadam, water-bound macadam (with or without a pitch carpet), &c., adjoining the concrete road, all as may be necessary and desirable under the local conditions. The actual determination must be left to competent parties who will give due consideration to the local conditions and the principles referred to above.

This committee therefore endorses with its approval and recommends the adoption by this body of a clause similar to that in the recent report of the Special Committee (on Bituminous Materials for Road Construction, &c.) of the American Society of Civil Engineers, and as follows: "Where cement-concrete pavements are laid the edges should be [illegible] ment to any softer shoulder material avoided by means of cement-concrete or other edgings, or such reinforcement of the shoulder material as may be necessary."

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—The rapid increase of sand wastes around our coasts is indeed a serious one, and Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

Resistance of Steel Conductor Rails.—The great attention which is now being given to the question of the electrification of railways and the number of undertakings in hand and projected, makes a recently issued report on the British standard method of specifying the resistance of steel conductor rails of special interest at the present time. The question was brought officially to the notice of the Engineering Standards Committee in March, 1913. It was then suggested that a conference of those interested should be held with a view of endeavouring to arrive at some general agreement as to the method to be employed in the future. This conference was held, and the result of the labours of the members, all of whom are prominently associated with railway and tramway work, was submitted to the Sectional Electrical Committee and the Main Committee of the Engineering Standards Committee, and is now issued as Report No. 68. In the introductory remarks an explanation is given of the reasons for selecting the particular method which has been adopted of defining the standard dimensions in terms of length and weight per yard, rather than in terms of length and sectional area. Useful tables of reduction factors for converting the resistance of a rail of known weight measured at a given temperature to its value in terms of the standard are included, and in an appendix will be found reduction formulæ so that previous values for the resistance of rails in terms of copper may be readily reduced to values in terms of the recommended standard. The price of the report is 10s. 8d. post free, and it may be obtained from any bookseller or direct from the offices of the committee, 28 Victoria-street, Westminster.

THINGS ONE WOULD LIKE TO KNOW.

(Concluded.)

Are not the following lines of Alfred de Musset worth committing to memory at the present crisis of our history?

Rise, for the day is passing whilst you are dreaming on,
Weigh'ers have buckled their armour and forth to the [illegible]
A place in the ranks awaits you, each man has his part to play,
Think not on the past or the future in the face of the stern to-day.

Could not all surveyors and other readers of this [illegible] men in their service that unless they take steps at once to help their country by enlisting there may come a time when they will bitterly regret that they did not take part in the protection of their hearths [illegible]

* * * *

Is it not interesting to hear that in response to the "appeal" to the members of the Institute of Sanitary Engineers indicating how they could assist their country in their positions as civilians and non-combatants, thirty-two members replied that they were prepared to join a Sanitary Company of Territorials should they be required, and that the council of the Institute believe they could raise such a company of sanitary experts sufficiently numerous to form a special unit for sanitary service?

* * * *

Is it not also creditable to this institute to find that fourteen other members are prepared to give their whole-time services in assisting local authorities whose regular staff of sanitary officials has been reduced by those who have been called away to fight for their country, and that forty-three other members are prepared to give part-time service?

* * * *

Is it not, on the other hand, to be regretted, if what we hear is true, that although the clerks and better-class men of this country are answering Lord Kitchener's "call to arms" in large numbers and showing the true manly spirit, the labouring classes, which are largely in the preponderance, are hanging back and are not responding in the manner which one would expect of all true Britishers? Is it not also a regrettable fact that in the country districts there appears to be a sort of apathy, one might almost say ignorance, as to the reasons for the war?

* * * *

Cannot the Labour Party be induced to see matters in the light that unless we convince the enemy that we are in deadly earnest the war will be unduly prolonged, with results which can only be disastrous to the labouring classes? Accordingly, should they not use their influence to encourage those whom they represent to respond in greater numbers to the "Call to Arms"?

* * * *

Should we not take to heart the motto which inspires our splendid Navy in all their work—"Do IT NOW," and be prepared to act accordingly?

* * * *

Apropos of this motto, are not the surveyors throughout the country to be congratulated on the prompt manner in which they have responded to the demand for the preparation of schemes for relief works; and does the general public realise the enormous amount of extra work that the preparation of such schemes has thrown upon these officials?

* * * *

How will the £4,000,000 voted by Parliament for housing the working classes be spent, and is it not to be hoped that it will not, either directly or indirectly, be used for political purposes? Is there not always some danger of this so long as party questions enter so largely into the government of this country?

* * * *

Will not the excellent plans and description of a scheme for building houses for the rural population which were given in last week's issue of THE SURVEYOR be exceedingly helpful in the direction of the preparation of schemes where the country is in a condition to proceed with the work?

* * * *

Was the enquiry held by the Local Government Board at Melton Mowbray on the 22nd ult. as to the complaint that the council of that place had not exercised their powers properly under the Housing Acts the first that has been held under these Acts; and what will be the result?

THE WAR.

CHADWICK TRUST AND SANITARY ORGANISATION.

In view of the immense importance of [illegible] sanitary organisation in the naval and military services during the present campaign, the Chadwick Trustees have resolved to award, at the close of this year, the Chadwick Gold Medal and £50 each to the naval and military medical officer respectively in the British service who shall have distinguished himself most in promoting the health of the men in the Navy and Army. The competition for these prizes will be made by the Director-General of the Naval and Military Medical Services. The Chadwick Trustees are also making arrangements for providing, or assisting in the provision of, lectures and demonstrations on naval, military and hospital hygiene. Particulars of these lectures will shortly be announced.

PRECAUTIONS AGAINST EPIDEMICS.

In the House of Commons on Monday the President of the Local Government Board was asked what steps were being taken to prevent any epidemic of disease occurring in this country in consequence of the arrival of refugees and others from those parts where disease was likely to be. Mr. Herbert Samuel stated in reply that, although there was no reason for any immediate danger of the kind suggested in the question, the Local Government Board were fully alive to the necessity of taking precautions. When they learnt a few days ago that a considerable number of refugees were coming in from the Continent, the board sent a medical inspector down to the port to make a special examination of those who arrived. Two days ago they sent a reminder to local authorities of their duties in connection with the prevention of smallpox, with instructions as to the course to be taken in the event of an outbreak. He could assure the hon. Member who had put the question that the Local Government Board were exercising every vigilance to safeguard the health of the people.

BUSINESS AS USUAL.

While a number of firms connected with the road-making and building industries are finding their business very considerably interfered with at the present time in consequence of the sudden cessation of all business with Germany, the Limmer Asphalt Paving Company, Limited, whose freehold mines are situated in France, and who also draw large supplies from Ragusa, Sicily, inform us that they are in the fortunate position of holding considerable stocks of material in connection with the various classes of work they undertake, and that they have advised the President of the Local Government Board that they are willing to supply to local authorities and others carrying out distress or relief works during the war their Lithomac asphalt paving and Lithofalt paving blocks at current market prices. The Lithofalt paving blocks in particular should appeal to engineers who are required to prepare schemes for relief work. These paving blocks, which, we understand, are at present being laid by the direct employment of labour by the boroughs of Hampstead, Poplar, Warrington, Rochdale among others, are designed to meet the wants of those local authorities who are obliged to find work for the unemployed. The whole of the work in connection with the preparation of the necessary concrete foundation and the laying of the Lithofalt blocks can be carried out under the supervision of the borough authorities by the direct employment of local labour. We believe we are correct in saying that the directors of the Limmer Asphalt Paving Company, Limited, have not discharged a single workman on account of the war, and have afforded facilities for the members of their staff to enlist, either in the Regular Army or in the Territorials. They have also arranged to keep open the places of all men who enlist.

LOCAL AUTHORITIES AND THE WAR.

Deptford Urban District Council have agreed to allow full pay to all their men on service.

All the lending libraries of Camberwell have had to be shut, as the staffs have volunteered for active service.

The military authorities have purchased six water carts and fifteen horses from the Deptford Borough Council for £1,470.

The staff of the Wood Green Urban District Council have unanimously decided to give a percentage of their salaries to the Prince of Wales' Relief Fund.

Twickenham Urban District Council employees have made from their wages their second weekly contribution, amounting to £3 19s. 2d., to the local Relief Fund.

Chislehurst Urban District Council will pay employees such a sum as, with the Government pay, will make up full salary or wages, and afterwards reinstate the men in their positions.

Manchester Corporation Gas Committee have voted £10,000 from surplus profits—£7,000 towards the Manchester Battalion which is being formed, and £3,000 towards the Lord Mayor's local fund, which now totals £40,000.

Antrim County Council have appointed a committee with full council powers to prepare and carry into execution schemes for the employment or otherwise for the relief of distress arising from the outbreak of hostilities.

A large machinery order given by Bradford Corporation Electricity Committee some time ago to a German firm was on Tuesday cancelled and transferred to the British Westinghouse Electric Company, Manchester.

Nineteen employees of the Worcester Corporation have been called to the colours. It has been decided to pay full salary or wages for a month, and to draw up a scheme of future allowances for submission to the next meeting of the council.

Esher and the Dittons Urban District Council have decided to keep open the situations of employees who have joined the Forces, and to continue to pay their wages during absence. Seven have already joined, and half-a-dozen more are expected to leave shortly.

The East Barnet Valley Urban District Council have resolved that the positions of volunteers shall be kept open, and that the difference between what was paid the men by the Government and what was paid by the council shall be made up by the council.

Gainsborough Urban District Council have instructed the surveyor, Mr. S. W. Parker, to make arrangements to set to work totally unemployed men three or four days a week, and have invited unemployed men to give their names to the surveyor.

The Blaenavon Urban District Council have resolved to pay the surveyor, Mr. E. W. Edwards, a month's salary while serving with the colours pending information regarding the rates of pay, and also to pay unmarried men on military service 5s. a week.

Manchester Corporation on Wednesday last passed a resolution that no employee who volunteers for active service in the Army or Navy shall be in a worse monetary position by reason of his enlistment than he is at present, and that an assurance shall be given him that his place will be kept open for him.

Cape Town [illegible] have decided to make a grant to the dependents of corporation employees on active service at the rate of 5s. in the case of a wife and 2s. for each child during the time such servants are away. This is exclusive of the Government allowance of 7s. 7d. for each wife and 1s. 2d. per child.

Sixty-five servants of the Blackburn Corporation and twenty-five members of the borough police force have been called upon by the military authorities, and the question of making allowances to families and dependents has been referred to the General Purposes Sub-committee. The various committees have been instructed to bring forward their programmes of public works, so that, in case of acute distress, employment could be provided.

All employees of the Edinburgh Corporation called up for service will be allowed the difference between the wages they receive from the corporation and their allowance from the Army or Navy. The number called up is, approximately, 200. The question was raised as to the position of such city employees who, being neither Reservists nor Territorials, enlisted at the present time, and it was agreed that they should be put on a similar footing to the others.

The Improved Wood Pavement Company, Limited, 46 Queen Victoria-street, E.C., give notice that after Monday, September 7th, no unmarried workmen who are eligible for the army will be retained in the employment of the firm unless they are the main supports of relatives or other dependents, or unless they are skilled workmen whose services are necessary for the benefit of unskilled men. Berths of all regular workmen will be kept open.

Modern Bituminous Surfaces and Bituminous Pavements.*

By ARTHUR H. BLANCHARD, M.CAN.SOC.C.E., Professor of Highway Engineering, Columbia University

Although bituminous pavements have been in use in American cities for nearly fifty years, the introduction of modern bituminous pavements, the construction of bituminous macadam roads and of bituminously cemented surfaces in America dating from about 1900. That point is well illustrated by the fact that in 1905 the total mileage of bituminous surfaces and bituminous pavements constructed under the direction of the county and State highway departments in the eastern part of the United States was only 416,700. Since that period the growth of the use of bituminous materials in the construction and maintenance of roads and pavements has been exceedingly rapid.

In order to avoid misunderstandings, the various methods of using bituminous materials referred to in this paper will be explained by the following definitions.

Bituminous surfaces are those consisting of superficial coats of bituminous materials with or without the addition of stone or slag chips, gravel, sand, or other fine granular character.

Bituminous macadam pavements are those consisting of broken stone and bituminous materials incorporated together by penetration methods.

Bituminous gravel pavements are those consisting of gravel and bituminous materials incorporated together by penetration methods.

Bituminous concrete pavements are those having a wearing surface composed of stone, gravel, sand, &c., or combinations thereof, and bituminous materials incorporated together by mixing methods.

The definitions of bituminous surfaces and bituminous concrete pavements quoted above have been advocated for adoption in the reports of the Special Committee on "Bituminous Materials for Road Construction and Standards for their Test and Use" of the American Society of Civil Engineers, whereas the fundamentals of the above definition of bituminous macadam pavements are embodied in the following quotation from the 1915 report of the Association for Standardising Paving Specifications: "If the stone is spread in place, and the bituminous cement or binder applied afterwards, the resulting product is bituminous macadam." As sheet asphalt pavements have been in use for many years, and as the essentials of good construction have been well established, this type of bituminous pavement will not be dealt with in this paper.

BITUMINOUS SURFACES.

Since the formulation of the fundamental principles of the successful construction of tar surfaces by the engineers of the Department of Roads and Bridges of France in 1903, bituminous surfaces have been used extensively in Europe. As an illustration might be cited the construction of 5,000,000 sq. yds. of tar surfaces in one county of England in 1911, under the supervision of the county surveyor of Kent, Mr. H. P. Maybury, M.INST.C.E. During the past eight years American engineers have used bituminous materials in this method of construction and maintenance of roads and pavements.

In the case of broken stone and gravel roads, the most efficient method of procedure is to thoroughly clean the surface by sweeping with hand brooms or horse sweepers and hand brooms, the final sweeping being done with bass or other fine-fibre brooms. The bituminous material, which is generally heated, is applied to the surface in amounts varying from one-quarter to one-half gallon per square yard with the aid of pouring cans, hose attached to tanks, hand-drawn gravity distributors, horse-drawn or motor-truck gravity, or pressure distributors. Some kind of mineral coating is generally applied to cover the bituminous material. The degree of cleanliness of the surface obtained by sweeping will depend to a large extent upon the details of the original construction. It has been found that a road with a thoroughly rolled and well puddled broken stone wearing surface composed of [illegible] from 1 in. to 2½ in. in longest dimension may be easily treated, and the essential adhesion of the bituminous surface readily secured. This method is characteristic of the modern practice of some of the foremost English and French engineers.

Considerable development has taken place in the use of different kinds of bituminous materials. Tars, both of the water-gas and coal-gas types, continue to be used to a large extent. Without doubt the most comprehensive specifications for the construction of bituminous surfaces with tar are those adopted by the Road Board of England. There has been noted a growing objection to the use of certain asphaltic oils which require from two to three weeks to "set up" to such an extent that tracking will not occur.

BITUMINOUS MACADAM AND BITUMINOUS GRAVEL PAVEMENTS.

Bituminous macadam and bituminous gravel pavements are of many types, one of the primary differences in construction being the use of one or two applications of the bituminous material. The efficacy of many of the types depends upon the combinations of sizes of broken stone or gravel and the combinations of bituminous materials used when two applications are employed. Variations in types also exist dependent upon the manner in which the different courses may be filled and the treatment of the filled course prior to the application of the bituminous material. The one application method is very similar in its simplest form to the construction of a bituminous surface, except that the bituminous material is applied upon a much more open surface. In the case of the two-application method, in certain instances an attempt is made to build up a two-course pavement, while in others the second application is in reality used as a seal coat.

Two of the main difficulties in the construction of bituminous macadam pavement have been to secure thoroughly compacted wearing courses of non-segregated broken stone and the uniform application of the bituminous cement so that the broken stones of the wearing surface would be uniformly bound together. In connection with the above statement should be noted the following excerpt from the 1914 report of the Special Committee of the American Society of Civil Engineers:—

"An important factor for successful results (in the construction of bituminous pavements by the penetration method) is the thorough compaction by rolling of the road metal before the spreading of the bituminous material."

Two methods which have given satisfactory results will be cited as examples of modern practice.

When the metalling in the wearing course consists of a naturally graded aggregate ranging in sizes from ½ in. to 1½ in., it has been found unnecessary to further fill the voids by the application of a finer product before the first application of the bituminous material. The character of the product referred to above is shown by the following mechanical analysis:—

Percentage passing	½-in. screen ...	18·9
,, ,,	¾-in. ,,	43·1
,, ,,	1-in. ,,	34·4
,, ,,	1¼-in. ,, ...	3·6
		100·0

After the wearing course has been thoroughly rolled, from 1½ to 1¾ gallons to the square yard of bituminous material is uniformly distributed. Stone chips, free from dust, are then distributed to fill the surface voids. After the chips are rolled, a seal coat of ½ to 1 gallon per square yard of bituminous material is applied. The pavement is finished by the rolling of a second application of stone chips.

As the second method will be described what the speaker considers the most satisfactory type of bituminous macadam pavement at present constructed in England. The bituminous pavement referred to is known by the name of "Pitchmac," and was designed by the city engineer of Liverpool, John A. Brodie, M.INST.C.E. The following description of the standard method employed in Liverpool is given by Mr. Brodie:

"Pitch-grouted macadam has been found to give

* Paper presented to the Canadian and International Good Roads Congress at Montreal.

most satisfactory results in streets of medium and light traffic, and is now being largely used in place of ordinary macadam, but also of more expensive pavements. It is laid to a depth of from 3½ in. to 4 in., in two layers. Where granite macadam is used, screen to a 2½-in. gauge for the lower layer, and to 1½-in. for the top surface. Each layer is put down by mechanical means, rolled twice, and after the grouting of joints and each mixture has been applied over the surface is thoroughly consolidated. The foundation is generally of hand-pitched rock, 10 in. deep, as for ordinary macadam, but in some cases a bed of ... has been used on main roads. Patch repairs are done by hand, and a surface covering for old boulder pavements, many of which still exist in Liverpool, on cart streets where the traffic is very slow. The cost of such macadam may be taken at 1s. (24 cents) per square yard per inch of depth."

BITUMINOUS CONCRETE PAVEMENTS.

Bituminous concrete pavements other than sheet asphalt and pavements laid by companies as proprietary articles have received more attention during the past three years than at any time since the days of Abbot, Leverich, Scrimshaw, and Van Camp. Less fear of litigation proceedings and the introduction of economical mixing machines equipped with heating attachments have exerted a marked influence, but, furthermore, the rapidly growing recognition of the inherent advantages of bituminous pavements constructed by the mixing method has been largely instrumental in its adoption for traffic conditions for which it is believed to be economical and suitable. Bituminous concrete pavements, in which broken stone forms an integral part of the mineral aggregate, may be divided into three classes.

It is self-evident that the simplest type is one having a mineral aggregate composed of one product of a crusher that is, similar to the product in the usual type of portable crushing and screening plant, which passes over one screen and through the larger holes of the adjacent screen. This broken stone, in certain cases, may be somewhat uniform in size, but usually such is not the case. In the speaker's opinion, an essential element in the construction of this type of bituminous concrete pavement consists in using a product of a crusher which will have a range from 1 in. to 1¼ in. in its sizes. As an illustration will be cited a mechanical analysis of a product which was obtained from a plant where the broken stone passed over a ½-in. screen and through a 1¼-in. screen:—

Percentage passing	¼-in. screen	...		1·2
,, ,,	½ in. ,,			4·2
,, ,,	⅝-in. ,,	...	...	34·7
,, ,,	¾-in. ,,	...		40·6
,, ,,	1 in. ,,	...	...	17·3
,, ,,	1¼-in. ,,	...	...	2·0
				100·0

It is apparent that the above product would not be referred to as composed of uniform-sized stone. It is of interest to note that certain bituminous concrete pavements, having a width of 25 ft., constructed with this product of broken stone in 1911 have been subjected to an average daily mixed traffic of 2,000 to 3,000 vehicles, and are at present in excellent condition with no maintenance charges to date.

This type of bituminous concrete pavement has been constructed for many years by using either one or, in certain cases, several courses of broken stone mixed with bituminous cement. As an illustration of the latter method will be cited the practice of one large construction company which builds this type of pavement. The first or bottom course of metal coated with bituminous cement ranges from 1½ in. to 2½ in., the second course from ½ in. to 1½ in., and the third course from ¼ in. to ½ in. The pavement is finished with a dressing of uncoated chips.

Asphalts, tars and tar-asphalt compounds have been used for the bituminous cement. In some cases one kind of bituminous material has been used in the mix and another kind for the seal coat; one of the most common combinations being the use of tar in the mix and asphalt for the seal coat.

As illustrative of some of the details of construction of this type of bituminous concrete pavement which should be covered in contracts, excerpts from specifications recently drafted by Mr. Prevost Hubbard and the speaker for the New York State Department of Efficiency and Economy will be cited. It should be borne in mind that the temperatures and other limitations specified apply to the bituminous cements and mineral aggregate covered in other sections of the specifications.

"Broken stone for the bituminous concrete shall be heated as directed, before entering the mixer, to between 66 deg. Cent. (150 deg. Fahr.) and 149 deg. Cent. (300 deg. Fahr.) in revolving dryers in which no flame shall be permitted to come in contact with the broken stone and in which the broken stone shall be continuously agitated during the heating.

"The asphalt cement or refined tar shall be heated in kettles so designed as to admit of even heating of the entire mass, with an efficient and positive control of the heat at all times. Asphalt cement shall be heated as directed to a temperature between 135 deg. Cent. (275 deg. Fahr.) and 177 deg. Cent. (350 deg. Fahr.). All asphalt cement heated beyond 177 deg. Cent. (350 deg. Fahr.), either before or during mixing with the broken stone, shall be rejected. Refined tar shall be heated as directed to a temperature between 93 deg. Cent. (200 deg. Fahr.) and 135 deg. Cent. (275 deg. Fahr.). All tar heated beyond 135 deg. Cent. (275 deg. Fahr.), either before or during mixing with the broken stone, shall be rejected.

"When thoroughly heated to the temperature directed, the asphalt cement or refined tar and the broken stone for the bituminous concrete shall be mixed so that the resulting mixture shall contain between 5 and 7½ per cent by weight of bitumen as directed. A mixer shall be used, having revolving blades, and so designed and operated as to produce and discharge a thoroughly coated and uniform mixture of non-segregated broken stone and asphalt cement. When discharged, mixtures of asphalt cement and broken stone shall have a temperature not more than 149 deg. Cent. (300 deg. Fahr.) and not less than 93 deg. Cent. (200 deg. Fahr.) as directed. When discharged, mixtures of refined tar and broken stone shall have a temperature not more than 121 deg. Cent. (250 deg. Fahr.) and not less than 66 deg. Cent. (150 deg. Fahr.), as directed.

"The bituminous concrete, heated and prepared as specified, shall be delivered direct from the mixer to the point of deposition on the foundation in trucks or wagons provided with canvas covers for retaining the heat. As delivered the bituminous concrete shall have a temperature of at least 66 deg. Cent. (150 deg. Fahr.). Material having a lower temperature than this shall not be laid upon the foundation.

"Rollers used on the bituminous concrete and the seal coat shall be well balanced, self-propelled, tandem rollers, weighing between 10 and 12 tons each. Each shall have a compression under the rear roller of between 200 and 350 lb. per linear inch of roll, and shall be provided with an ashpan, which shall prevent ashes from dropping on to the bituminous concrete or seal coat.

"As soon as possible after the compaction of the bituminous concrete, when the surface is clean and dry, a seal coat of the hot asphalt cement shall be evenly distributed over the bituminous concrete, and spread by means of squeegees as directed. The asphalt cement shall be applied at a temperature not less than 135 deg. Cent. (275 deg. Fahr.), nor more than 177 deg. Cent. (350 deg. Fahr.), at a rate of ½ to 1 gallon per square yard, as directed. A thin, uniform layer of dry, clean No. 1 broken stone (stone chips) shall be immediately spread over the asphalt cement, as directed, by machines or skilled workmen. The spreading of the No. 1 broken stone shall not lag more than 20 ft. behind the placing of the asphalt cement coating. No. 1 broken stone shall not be placed on the wearing course before the asphalt cement of the seal coat is applied. The surface of the bituminous concrete shall be kept scrupulously clean until the seal coat is applied, and the contractor shall not permit any hauling over the wearing course before the completion of the seal coat.

"No bituminous concrete shall be mixed or placed between October 1st and May 15th except by written permission, and no bituminous concrete shall be mixed or placed when the air temperature in the shade is below 10 deg. Cent. (50 deg. Fahr.), or when the foundation is damp or otherwise unsatisfactory."

The second type usually consists of the broken stone composing one product of a crusher and sand or other fine mineral matter mixed together with a bituminous cement. The wearing surface of this mix is sometimes finished by rolling in fine stone chips, but generally a seal coat is used, together with fine mineral matter for a top dressing. When constructed on a commercial scale, the mineral aggregate is

[illegible] the following [illegible] concerning the composition of the mineral aggregate of Warrenite, a proprietary pavement of the Warren [illegible] was used by Mr William H. Connell, chief of the bureau of highways, in [illegible] city of Philadelphia:—

"Material passing 1½in. screen and retained on [illegible] per cent. Material passing No. 4 sieve and retained on No. 10 [illegible] per cent. Material passing No. 10 sieve and retained on No. 30 sieve, 10 to 5 per cent. Material passing No. 80 sieve, at least 25 per cent of [illegible] will pass a No. 200 sieve, 10 to 5 per cent. The balance to pass No. 30 sieve and be retained on No. 80 sieve."

The 1914 [illegible] of the State of New Jersey [illegible] the following description of the grading of a bituminous concrete pavement similar to the one [illegible]:—

Sizes.	Percentages. Minimum.	Maximum.
Passing 1½in. and retained on [illegible]	0	15
,, 1in. ,, ½in.	40	50
,, ½in. ,, [illegible]	10	25
,, [illegible] ,, No. 10	8	15
,, No. 10 ,, No. 30	12	22
,, No. 30 ,, No. 80	5	15
,, No. 80 ,, No. 200	3	8
,, No. 200 sieve	2	8
Bituminous cement	6·5	8·5

As another illustration might be cited, the well-[illegible] grading of a mixture of broken stone and sand. The [illegible] is as follows:—

Percentage of bitumen	from 7 to 11
mineral aggregate passing 2in. and retained on ½in.	,, 7 to 11
mineral aggregate passing ½in. and retained on No. 10	,, 18 to 30
mineral aggregate passing No. 10 and retained on No. 30	,, 25 to 35
mineral aggregate passing No. 30 and retained on No. 80	,, 8 to 22
mineral aggregate passing No. 80	less than 10

In the construction of all types of bituminous concrete pavements, in addition to the requirements covering the properties of the bituminous cement and the quality and character of the mineral aggregate, certain essential features should be given careful consideration. The following citations from the 1914 report of the Special Committee of the American Society of Civil Engineers are especially pertinent:—

"Where the character of the traffic justifies the use of a bituminous concrete pavement, the same conditions demand an extraordinarily strong foundation therefor.

"The amount of bituminous material to be used in any case will depend upon the peculiar conditions of that case, such as the kind of road metal and of bituminous material, the character of the aggregate, the climatic conditions, &c.

"The character of the mineral aggregate to be used may be controlled by local conditions, but the best results can only be obtained by the use of the best materials. Excessive sizes, or excessive variations in the size of the mineral particles, should be avoided, and the utmost care must be taken to avoid the segregation of the different size particles.

"Mixing machines should be used, and hand-mixing methods should be avoided wherever practicable.

"In the use of a heated aggregate for the construction of a bituminous concrete pavement, non-uniformity or excess in the heating of stone should be avoided.

"Where bituminous pavements are laid, the edges should be protected and a sudden transition from the pavement to any softer shoulder material avoided by means of cement concrete or other edgings, and such reinforcement of the shoulder material as may be necessary."

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.

– MASSINGER: "The Fatal Dowry," Act ii., 2

CLOSSARY OF ROAD TERMS.

To the Editor of THE SURVEYOR.

SIR,—I have read with considerable interest the review in your last issue of my "Glossary of Road Terms," which is exactly the description of criticism necessary to make the book useful.

In the first work of the kind that has ever been published it was naturally extremely difficult to decide what words to include and what to exclude. My only guide was to read books, lectures and discussions on [illegible] and observe all the technical [illegible] that were used by the writers and speakers, and from my knowledge of the subject—gained over a very long period of experience—to add such words as I felt might be useful.

My next object was to give very short definitions where the words were fairly obvious, and to extend [illegible] definitions to words which were somewhat in dispute. I agree with your criticisms that my definitions of the words "pan," "pan-ful," "scarify," "drag," are short, but to extend them would, perhaps, have been unnecessary. If your reviewer could kindly, in reply to this letter, suggest better and more comprehensive definitions, I would gladly consider them in another edition.

With regard to the word "crust," I cannot agree with your reviewer. The word "crust" cannot, I think, be intended to refer to the whole thickness of road formation, but only to the surface crust and the strength crust; the bottoming, or foundation, cannot, I think, be termed a "crust." However, I quite agree that this new word "crust" requires further elucidation, and further correspondence on this subject would be very useful in the columns of your paper. As to my inadequate definitions of "depot," "aqueduct," "invert," "lagging," and "derrick"—I quite agree as to "depot"—the definition is too brief. "Aqueduct" might have been omitted altogether, as it is a rather remote road term. As to "invert," I should be glad of a better definition, but I took mine from that excellent work "The Imperial Dictionary of the English Language," and it is the best I could find. "Lagging" is, I agree, a difficult word to define; but I think mine sufficiently covers the two meanings of the word. Here again I should be glad of better definitions if not too lengthy. As to "derrick" referring to boom and stays, neither of which latter words are defined, I think your reviewer is a little hypercritical, as to define words used in definitions which are apparently obvious would naturally unduly expand the book. His criticism is, however, worthy of consideration. With regard to geological terms having been left out altogether, your reviewer has discovered a weak spot. I commenced to deal with these, but found the work of compilation so difficult and extended that I fell back on the definitions settled by the Engineering Standards Committee as being "the line of least resistance."

With regard to the anomaly of the use of the expression "trade name" as applied to proprietary manufactured articles and to natural rocks, here again I must plead guilty to having followed the definitions given by the Engineering Standards Committee. Your reviewer will find that, under the words "schist" and "shale," I say "the trade name of a group of road-making rocks," in which I followed scrupulously the exact words used in the definitions given by that committee. As to topographical terms being further extended to include "glen," "dale," "spur" and "pass," it might be well to include them hereafter, but it is very difficult to draw the line between those which are useful and those which are not. My impression is that I only included those topographical terms which I had found had been used by writers or speakers when discussing road questions.

As to the omission of certain words relating to law and administration, the same remarks or "excuses" apply.

With regard to the numerous other criticisms of your reviewer, I agree with some of them, but not all. Space will not permit me to refer to them individually, but with regard to his question as to why if I included "immerse" I did not include "swim," it is obvious that the word "immerse" is frequently used in connection with road making, whereas I have never yet discovered the word "swim" used in connection therewith. The latter part of your

reviewer's criticisms, which are in the nature of corrections, I shall certainly look into carefully; they seem to be quite right.

In conclusion, may I be permitted to thank your reviewer very heartily for his excellent review, and for his exceedingly able and well-thought-out criticisms? The "Glossary" was much more difficult to compile, and took much more time, than I anticipated when I commenced the task, but my object was, if possible, to assist surveyors and others who have, I regret to say, been hitherto somewhat lax in their use of terms as applied to road construction and maintenance. I should be only too glad if every surveyor in the country would read my "Glossary," digest it as your reviewer has done, and criticise and find fault with it as much as he pleases. It is only by ventilating and discussing subjects that something like the truth eventually emerges.—Yours, &c.,

H. PERCY BOULNOIS, M.INST.C.E.

RURAL LABOURERS' COTTAGES.

To the Editor of THE SURVEYOR

SIR,—Will you allow me to thank you for your editorial comments on the rural cottage designs illustrated in your issue of the 28th ult., and at the same time permit me to remark that the estimate of £150 is based on a rate of 5d. per foot cube (measured from 1 ft. below ground level) as against the 4½d. rate quoted by you?

The rate of 5d. was adopted as a fair average for cottage work on the ordinary lines, but this rate will differ according to locality, ranging as low as 3¾d. per foot and as high as 6d. Whatever the rate may be in a given district, and to a given specification, it is clear that the very great savings to be effected in the quadruple form of construction as compared with the usual types will represent a reduction in cost of seldom less than ¾d. to the foot.

If economical considerations insist on a cutting down of the scale of accommodation, there is no difficulty in getting the cost within the neighbourhood of £100, while at the same time retaining the advantages of the internal planning and the external architectural effect.—Yours, &c.,

C. L. FIELDER.

"Kingsmead," Latchmere-road,
Kingston-on-Thames.
September 1, 1914.

"QUENAST."

To the Editor of THE SURVEYOR.

SIR,—At this time, when the hearts of Englishmen go out to plucky little Belgium, the thoughts of many surveyors turn to the great Quenast quarry, well known to most of the visitors to the Brussels Road Congress of 1910, and as so many of our friends are asking for news of Quenast, we should be very grateful if we might make use of your columns.

At Quenast the majority of the workmen were called to the colours, the quarry manager took up his duties as an officer of garrison artillery in one of the forts at Namur, while the managing director, Mr. Hankar Urban, as mayor, has no doubt had to be responsible to the Germans for law and order in the village.

The big battle recently fought at Mons would have taken place on the doorstep of the quarry, being on the lines of the German base.

Since this battle was fought we have had no news, and fear we shall hear nothing for some months.

We are making arrangements for carrying out our contracts in other materials if possible, and under the terribly trying circumstances we feel sure we shall have the sympathy and help of our many SURVEYOR friends and customers.—Yours, &c.,

THE LONDON GRANITE COMPANY, LTD.
(H. L. Wettern, Director)

August 31, 1914.

PRO PATRIA.

In THE SURVEYOR of August 21st, in the column of "Things One Would Like to Know," it was asked if it would not be possible to compile an "Honours" list of municipal, engineering and sanitary officials who are taking an active part in the great war. With a view to carrying out the suggestion we publish below such information as has come to hand, and should be obliged if readers would assist us by notifying us of other cases within their knowledge.

Ashurst, J., city surveyor, St. Albans.

Ayre, C. A., third assistant engineer to the Watford Urban District Council, has received notice to hold himself in readiness for the Special Reserve.

Barker, E. A., electrical engineer, Barnsley Corporation.

Bell, Leonard, sanitary inspector, Westhampnett Rural District Council, Lieutenant and Transport Officer attached to the Eastern Mounted Brigade of Field Ambulance (Territorials).

Blake, Leslie, assistant surveyor to the Wincanton Rural District Council.

Edwards, E. W., surveyor to the Blaenavon Urban District Council.

Gladwell, C. W., assistant surveyor to the Eton Rural District Council, attached to South Midland Brigade Army Service Corps. Mr. Gladwell has volunteered for foreign service.

Hooley, E. P., M.INST.C.E., county surveyor of Nottinghamshire, with the 8th Battalion of the Sherwood Foresters.

Jenner, ——, inspector of nuisances to the Battle Rural District Council.

Middleton, ——, inspector of nuisances to the Charlton Kings Urban District Council.

Shaw, David Honeyman, assistant district master of works, Dunfermline District, Fife County Council, sergeant, Highland (Fife) Royal Garrison Artillery (Territorials). Volunteered for foreign service.

Smale, W. L. B., surveyor for the Northern District under the Liskeard Rural District Council, 4th Battalion of the Devon Regiment.

Tebbitt, H. S., surveyor and inspector to the Tutbury (Staffs) Rural District Council, a member of the Legion of Frontiersmen.

In addition to the "Honours" list of municipal engineering and sanitary officials who are taking part in the great war, we think it will interest our readers if we also publish the names of those in the commercial world who are giving their services, and we have great pleasure in recording the following names of the "commercique" list:—

Beadle, Herbert, managing director of British Macadams Company and Road Maintenance Company, Limited, second lieutenant in the 4th Home Counties Howitzer Brigade.

Cooper, H. L., director of Cooper, Wettern & Co. and H. L. Cooper & Co., Limited, colonel commanding Transport Column A.S.C., Wessex Division.

We understand that both these gentlemen, who are well known to municipal and county engineers, have volunteered for foreign service. There are, doubtless, many other names which could be added to this list, and we shall be grateful for any assistance that can be rendered us in making it complete.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

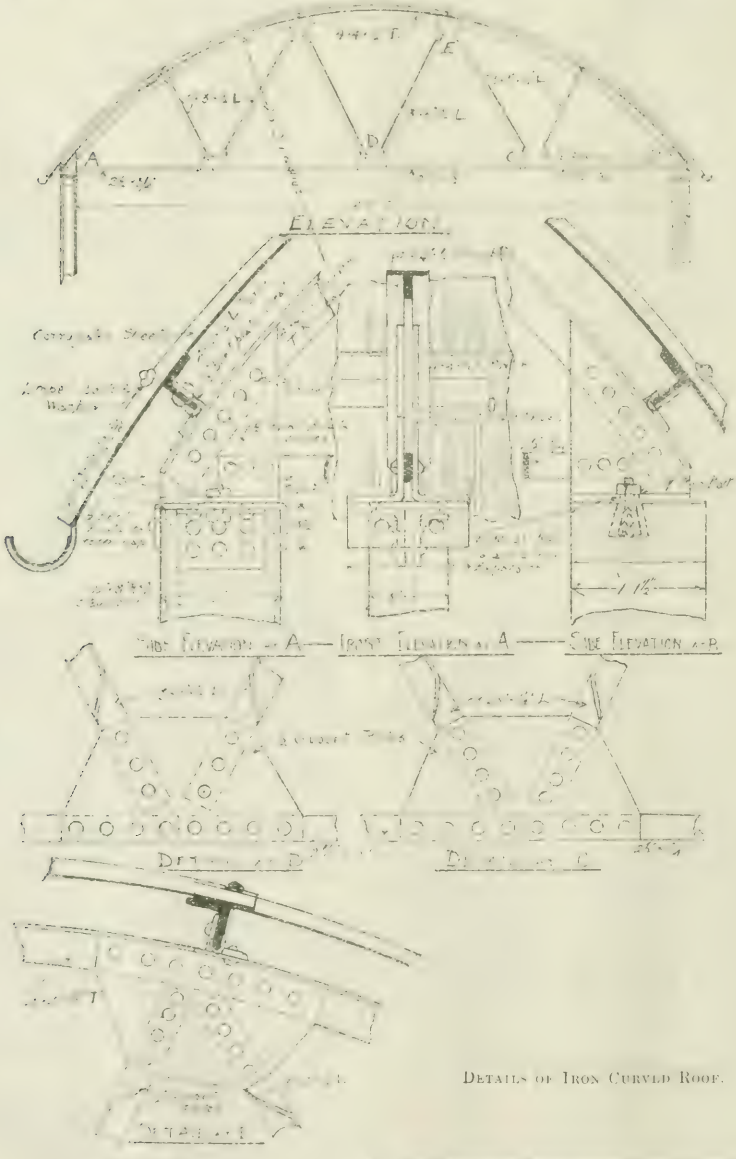
All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. *Envelopes must be marked 'Assistants' Section.' In the top left-hand corner. Correspondents are invited to submit questions for consideration, and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The premium for August has been awarded to

Mr. J. A. REDFERN,
72 Nottingham
Forest

whose solutions were by the opinion of the adjudicator best the best received during the month.



DETAILS OF IRON CURVED ROOF.

QUESTIONS.

This week answers are invited to the following questions.

417. Sewer Construction.—A sewer is being constructed partly in tunnel. Describe a method of giving the levels in the heading, referring specially to the continuation of the line of levels from the surface. Name

421. Reactions of Beams. Show how to find graphically or otherwise the pressures on the two supports of a horizontal beam which is loaded at any given point

422. Building Construction. The earth in front of a certain basement to a house has to be supported for a depth of 6 ft. Give a section of a suitable retaining wall, and prove its stability by a graphic diagram.

423. Sewer Construction.—Show by sketches (plan

and sections the junction of a 3-ft. and a 5-ft. brick barrel sewer.

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

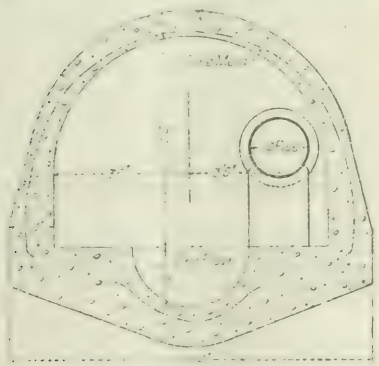
418. Iron Curved Roof. Show details of an iron curved roof of 40 ft. span, resting on girders and stanchions on one side, and on a 14-in. brick wall on the other. The roof is to be covered with corrugated iron. Show enlarged details at the foot of the principal rafter at each end. (K. G. F., *Budleigh*.)

A general elevation of the truss is given. In this type of truss it will be found that all the internal members of the truss will be liable to a compressive stress, as the wind acts on one side or the other. There will be no difference at the foot of the principal rafter as to the truss itself, both shoes being formed of ½-in. plate, bent to shape, being fixed on the brick wall side to a stone template by 1-in. rag bolts, and on the stanchion side by means of 1-in. bolts passing through the cap and angle piece. The cap is formed of bent plate riveted to the stanchion by means of bent plate cleats. If the bottom ends of the stanchions are securely fastened into the ground there will be no need for girders at the top of the stanchions, unless the stanchions are more than 10-ft. centres, the purlins stiffening the structure sufficiently. (J. A. R., *Faversham*.)

WATER MAIN IN SEWER.

By STUART HOWARD,
Sewer Department, Montreal.

The accompanying illustration shows a concrete sewer so constructed that the main water pipes can be placed in it on standards. The storm water, which is admitted from portions of the city on the combined system, does not rise very high in the sewer, the



greater portion of the area served by this sewer being on the separate system.

The manholes are so constructed that the water pipes can be lowered into the sewer and placed on the standards. At the ground surface the manhole opening is 2 ft. by 2 ft. 6 in., and at the crown of the sewer they are elongated, so that the water pipes can be lowered at an angle to clear the walls. From *Engineering Record*.

Hunslet Town Planning Scheme.—The town planning scheme of the Hunslet Rural District Council has now arrived at the end of its first stage, plans and proposals having been deposited at the offices of the council for inspection. The council propose to restrict the number of houses to be built in one part of the area to eight per acre, and in another part to fourteen per acre; while the greatest number which may be arranged for in other parts is twenty per acre.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Birmingham, Tame and Rea District Drainage Board (August 26th. Mr. [illegible]) [illegible] stated that the scheme was required owing to the proposed action of the Corporation, and the question of the development of building estates in the district. Should any houses be built on some portions of the estates they would be [illegible].

Colchester T.C. (August 24th. Mr. F. H. Tulloch).—£8,325 for wood paving in Crouch-street, Head-street, High-street, Hythe-hill, Hythe-quay, and Hythe Station-road. It was explained that the work of wood paving the streets named was being carried out in conjunction with a scheme inaugurated by the town council, the county council and the Road Board, and that, although the town council were asking for a loan of £8,325, the sum of £5,000 would be received from the county council for the purpose of carrying on the work.

Lowestoft T.C. (September 1st. Mr. A. W. Brightmore).—£11,120 for works of sewerage, including the execution of works in the urban district of Oulton Broad and the parish of Oulton.—The town clerk, Mr. R. B. Nicholson, stated that the loan indebtedness for sewerage purposes was £11,016. The proposed works had been delayed through a scheme between the town council and the Oulton Broad Urban District Council falling through. The work had been expedited in order to provide employment for those who might lose their work through the war. The borough surveyor, Mr. G. H. Hamby, explained the plans, and said the pumping stations would be underground.

Neath R.D.C. (August 27th. Mr. H. Shelford [illegible]) [illegible] flushing purposes.—It was stated by the surveyor, Mr. W. E. C. Thomas, that at present the [illegible] dealt with by a tank which emptied into the river.

Newport (Mon.) T.C. (August 18th. Mr. W. M. Cross).—£10,321 for the construction of a main sewer and outfall works.—The town clerk, Mr. A. A. Newman, said the council asked for a period of thirty years for repayment. The works were being constructed by agreement with the British Mannesmann Tube Company, who were proposing to erect large works.

Rhondda U.D.C. (August 28th. Mr. H. Shelford [illegible]) [illegible] works in the urban district of Pontypridd.—Mr. W. P. Nicholas, clerk of the council, stated that the works were to be erected at Trehafod in substitution of old works which had been damaged by mining operations and subsidence. The application was supported by Mr. W. E. Lowe, surveyor to the Pontypridd Council, who said they had suffered in the past by the pollution of the river. Plans of the scheme were submitted by Mr. E. H. Barber, surveyor, and Mr. E. Taylor, deputy surveyor.

Stoke-on-Trent T.C. (August 12th. Mr. R. G. Hetherington).—£3,122 in respect of alterations to Longton Town Hall; £1,050 for the [illegible] in Cromer-road, Hanley, for the purposes of a refuse destructor; and £11,113 for works of paving and surface-water drainage in Waterloo-road, Wedgwood-street, and Scotia-road, Burslem.—The necessary information was given by the officials, including the assistant borough surveyor, Mr. J. R. Heath. The inspector called attention to the fact that the building extras at Longton Town Hall amounted to £1,945, the greater portion of which had gone in a scheme of decoration not sanctioned by the board. He thought that some of this work ought to have been provided for in the original estimates. Some of the extra [illegible]

Thakenham R.D.C. (August 26th. Mr. R. G. [illegible]) £172 for the purchase of a water supply, in the parish of Sparrow Green, and for the purchase and re-erection of Mount Pellon and Mount Pleasant Cottages, Thakenham. [illegible] the Boards and Messrs. [illegible] the Local Government Board [illegible] Mr. W. Wardale [illegible] Mr. A. W. [illegible]

Torquay T.C. (August 27th. Mr. W. O. E. Meade-King) [illegible] Wheatridge-lane. [illegible] a portion of the original highway between Torquay and Paignton and of some parts was only 10 ft. to 12 ft. wide. The Great Western Railway Company had [illegible] a portion of the highway, substituting a 30-ft. road. The town council wished to make Wheatridge-lane 36 ft. wide, and the railway company had arranged [illegible]

APPLICATIONS FOR LOANS.

Chapel-en-le-Frith R.D.C.—£700 for the completion of the new reservoir.

Chesterton R.D.C.—£770 for workmen's dwellings.

Chorley T.C.—£3,250 for a new street, and £650 for shelters, swings, and a caretaker's hut at the recreation ground.

Colne T.C.—£480 for road improvement.

Foleshill R.D.C.—£14,250 for a housing scheme.

Loughborough T.C.—£500 for street paving works.

Lowestoft T.C.—£10,900 for resurfacing, and £2,200 for kerbing and channelling.

Macclesfield T.C.—£3,300 for alterations to school buildings.

Neath R.D.C.—£100 for water mains extension, and £500 for road widening.

Newport (Mon.) T.C.—£16,070 for works at the South Cliff Gardens.

Petersfield R.D.C.—£8,750 for works of sewerage.

Wem U.D.C.—£1,000 for the erection of cottages.

Wigan T.C.—£3,726 for alterations and extensions to the baths.

Wrexham T.C.—£1,660 for the purchase of land for a housing scheme.

LOANS SANCTIONED.

Aberystwyth T.C.—£2,610 for workmen's dwellings.

Hastings T.C.—£16,000, revised estimate for the Hastings Pier shore end improvement.

Hebden Bridge U.D.C.—£1,200 for the purpose of the electricity undertaking, and £3,900 for street improvement.

Heckmondwike U.D.C.—£4,780 for works of paving.

Holmfirth U.D.C.—£2,360 for works of sewerage.

Kendal T.C.—£571 for works of road improvement.

Lismore R.D.C.—£3,000, supplemental loan for the improvement scheme.

Llandudno U.D.C.—£13,195 for the provision of golf links, and £4,855 for a housing scheme.

Lymington T.C.—£1,845 for a scheme of sewerage.

Maidstone T.C.—£320 for main sewer extension.

Manchester T.C.—£7,567 for private street improvement works.

Runcorn R.D.C.—£405 for works of water supply, and £705 for street works.

Sittingbourne and Milton Joint Hospital Board.—£3,320 for building extensions.

FORTHCOMING INQUIRIES.

THE CLEETHORPES AND SCARBOROUGH MEETINGS.

As we go to press we learn that, while the meeting of the Institution of Municipal and County Engineers arranged for the 26th inst. at Scarborough has been cancelled, the one at Cleethorpes on the 19th inst. will duly take place.

2nd London Sanitary Company. R.A.M.C.T.—A few vacancies will probably occur in the 2nd London Sanitary Company, and those who wish to join this company for sanitary service should send in their names to the secretary of the Royal Sanitary Institute, at the offices, 90 Buckingham Palace-road, for forwarding to the proper authorities.

Recruits for Field Ambulance Detachments.—The Royal Sanitary Institute has been officially asked to make known to the members and associates a requirement by the War Office for the immediate formation of four field ambulance detachments (Territorial Force), consisting in the aggregate of 7[illegible] men. This requirement should especially appeal to those connected with the institute, because of their interest in and knowledge of sanitation and preventive measures, and it is hoped that this opportunity for sharing in the national service will be readily responded to. Applicants for enrolment should apply to the Duke of York's Headquarters, Chelsea (entrance by Turk's-row-gate, off Lower Sloane-street; office is immediately opposite the gate). It is proposed to arrange at the institute lectures and demonstrations for the recruits.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works, of which particulars appear below: Buildings—Darwen £6,500, Sowerby Bridge £7,000, housing and town planning—Wallsend; roads and materials—Chelmsford, East Barnet £6,283, Lowestoft £13,100, Ramsgreave £11,000, Rochdale £10,000, St. Pancras £13,250; sewerage and sewage disposal—Llandilo, Manchester £138,000; water, gas and electricity—Coventry. Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Brierley Hill R.D.C.—The surveyor, Mr. J. L. Harpur, has prepared plans for three underground conveniences which will be considered at the next council meeting.

Bury (Lancs) T.C.—The council have accepted with regret an offer of Colonel Barlow to purchase certain land adjoining the Bank-street recreation ground, and to build baths and wash-houses on part of it for the benefit of the residents.

Darwen T.C.—It has been agreed to reconstruct the swimming baths and washing baths, at an estimated cost of £6,541.

Failsworth U.D.C.—A decision has been reached to build public baths from plans by Messrs. Woodhouse & Howard, of Manchester.

Sevenoaks R.D.C.—Proposals are being considered for the extension of the isolation hospital, at an estimated cost of £1,500.

Sowerby Bridge U.D.C.—A scheme is under consideration for the provision of public baths at an estimated cost of £7,000.

Warrington T.C.—The tenders of Messrs. J. Broadhurst & Sons, at £105 and £300 respectively, have been accepted for the construction of public conveniences.

HOUSING AND TOWN PLANNING.

Aldeburgh T.C.—The council have passed a resolution expressing their willingness to take back a portion of the land let to the local electric supply company, in order that it should be let on building lease for artisans' dwellings.

Billinge U.D.C.—It has been resolved to take the steps necessary for the creation of a Trust under the Working Class Dwellings Act.

Gwyrfai R.D.C.—The tender of Messrs. Williams Brothers, of Brynthir and Llanberis, at £6,977, has been accepted for the erection of fourteen workmen's dwellings in the quarry villages of Ebenezer and Clwtybont.

Lanarkshire C.C.—The Middle Ward District Committee have resolved to approach the Local Government Board to ascertain what support the Government would give, under the Housing Act, to enable the local authority to erect workmen's houses, a tentative scheme for which was submitted.

Wallsend T.C.—A report of the Housing Committee has been adopted recommending that 100 houses should be provided without delay, and that the Local Government Board should be asked to give sanction to the council to sell 8 acres of corporation land at a price which would induce builders to erect houses of the class required at an early date. It was also resolved that investigations in the Willington Quay and Willington districts should be expedited with a view to assisting the council to determine where the houses should be built.

REFUSE COLLECTION AND DISPOSAL.

Ilfracombe U.D.C.—The surveyor, Mr. O. M. Prouse, has presented a scheme for the erection of a destructor at Rosslyn Farm, at an estimated cost of £4,120, to which the council will give consideration at the next meeting.

ROADS AND MATERIALS.

Barking U.D.C.—A new footpath is to be constructed in Water-lane at a cost of £208.

Belfast T.C.—The Improvement Committee have adopted the recommendation of a sub-committee for the execution of street widening and other works which would provide employment as relief labour. The city surveyor has been instructed to have portions of Peter's-hill, Shankill-road and Falls-road widened as soon as the necessary preliminaries with regard to the acquisition of land have been completed.

Bentley U.D.C.—A widening scheme on the Doncaster and Selby main road has been approved, the cost being estimated at £2,100.

Bridgwater R.D.C.—The surveyor, Mr. W. A. Collins, has prepared a scheme for the improvement of Dame Withycombe's Hill, at Otterhampton, and it has been decided to ask the Road Board for a grant for making it good. The surveyor is in preparation several other improvements to submit to the county council, and he also advises the purchase of another steam roller. The council will discuss this latter proposal at the next meeting.

Bridlington T.C.—The council are seeking to expedite loans for the carrying out of the widening of St. John-street, Ferry-road, Hilderthorpe-road, the improvement consequent upon the acquisition of the Priory Approach Trustees' property in Cemetery-road, Nunkeeling, Pinfold-street, Kirkgate and Bayle-gate, and also to carry out other improvements.

Bristol T.C.—At the meeting of the Sanitary Committee last week the city engineer, Mr. L. S. McKenzie, and his staff were congratulated upon having kept their demands so well within the half-year's estimate, and it was stated that a schedule of the work it was proposed to do had already been sent to the Road Board. The city engineer suggested that the widening of the Avonmouth-road between West Town-lane and Cook-street should be added. The chairman, Alderman Lloyd, thought it would be well if the city engineer made a further general survey of the city, with a view to [illegible] any further work could with advantage be added to the list which had already been prepared.

Chelmsford T.C.—It has been agreed to proceed at once with the laying of wood paving in Duke-street, from the Golden Lion to the railway arches. The borough engineer, Mr. P. T. Harrison, has submitted to the county council a scheme for widening Galleywood-road, at an estimated cost of £5,000.

Dublin T.C.—The Cleansing Committee have issued a report in which it is stated that they had under consideration the question of improved street cleansing and watering, and went closely into the methods now generally adopted for carrying on this work by means of mechanically propelled machines. By arrangements with the tramway company experimental night watering was carried out with the company's watering wagon, the result proving very satisfactory. During the period of experiment the wagon covered about 16 or 17 miles of streets per night, and it was found that this wagon was capable of amply watering most of the streets from pathway to pathway with one journey. On two nights, when the work was at its best, eight wagonloads of water were distributed in this way, the capacity of the wagons being 3,000 gallons, and the cost working out at about 7s. per night. Advertisements were subsequently inserted by the committee for tenders for a motor watering wagon, and likewise for tenders for motor sweeping machines, and a report on this matter will be submitted to the council.

East Barnet U.D.C.—An estimate for slab-paving of £6,283 has been submitted to the General Purposes Committee, and this committee have appointed a sub-committee to go round the district with the surveyor, Mr. H. York, and examine the footpaths included in the estimate.

Hull T.C.—The Works Committee will complete the widening of Pickering-road, widen Hedon-road to the extent of the land recently purchased, widen and make up Far Saltings-lane, between Cottingham-road, tar-paint macadam roads by hand instead of by machine, make up gravel verges on the Boulevard, St. George's-road and other streets where desirable. They will also employ a fourth repairing gang, and level material into the pond at the Ringrose-street tip. The committee will also carry out a number of outstanding paving works in a number of streets, for which the corporation have obtained loans.

Ilford U.D.C. [illegible] adopted the [illegible] Mr. H. Shaw to the [illegible] Wanstead and Woodford Road Board.

Liversedge U.D.C. The Road Board have had [illegible] with regard to the [illegible] Mr. A. [illegible] roads.

Lowestoft T.C.—The borough surveyor, Mr. G. H. [illegible] the Local Government Board for sanction to borrow [illegible] make application to the Road Board for a grant in aid [illegible] accepted for the supply of a steam roller.

Ramsbottom U.D.C. [illegible]

Rhyl U.D.C. It was agreed to carry out the scheme prepared by the surveyor, Mr. A. A. Goodall, [illegible] A combined screen and shelter will be erected between [illegible] and a roof projecting over the seats on both sides. At a later date the council will consider the laying out of the remaining portion of the sands between High-street and the Marine Gardens, in order to check [illegible]

Rochdale T.C.—A scheme is being considered for a new road from William Henry-street to Castleton. The cost is estimated at £10,000.

St. Austell R.D.C.—Steps are to be taken to obtain grants from the Road Board for road widenings, the construction of short pieces of new road, and the cutting off of corners.

St. Pancras B.C.—A special committee have submitted a list of streets which could be repaired at a total cost of £13,259.

Salford T.C.—The Improvements Committee have [illegible] proceed with a scheme for the widening of Whit-lane [illegible] Pendleton Colliery, and widen the footpath leading from Eccles Old-road to Bolton-road.

Sudbury T.C.—In respect of the proposed reconstruction of the road at Ballingdon Hill the council have submitted to the Road Board (through the West Suffolk County Council) a request for a contribution of £1,000.

Totnes T.C.—The tender of the Edison Steam Rolling Company has been accepted for steam rolling for the ensuing year.

Watford R.D.C.—A scheme has been adopted for making up three new roads at an estimated cost of £1,300.

SEWERAGE AND SEWAGE DISPOSAL.

Barnstaple R.D.C.—A scheme of sewerage for [illegible] the cost of [illegible] the matter [illegible]

Carlisle R.D.C.—The engineer, Mr. J. Graham, has received instructions to prepare a report on the treatment of the effluent, the disposal of the effluent from the sludge pit, the renewing of the coping of the wall of the circular tank, and as to the improvement of the grounds attached thereto.

Colne T.C.—Sewer extensions estimated to cost £259 have been approved.

Llandilo R.D.C.—The council have agreed to proceed with the Efailfach and Bynaman drainage schemes.

Manchester T.C.—A scheme is being considered for the extension of the Davyhulme sewage disposal works, at an estimated cost of £97,000, and the corporation are also recommended to carry out sewer extensions at an estimated cost of £41,000.

Redruth R.D.C.—Mr. A. F. Bassett, of Camborne, [illegible] £500 towards a scheme for a tunnel through the North Cliffs to take away the sewage, and the council have decided to confer with the Redruth Urban District Council on the subject.

Salford T.C.—The Rivers Committee, if relief works are started, can find employment for a number of men [illegible] the excavation necessary for new filter-[illegible] at Mead Wharf sewage works.

WATER, GAS, AND ELECTRICITY.

Coventry T.C.—It has been agreed to construct a new storage reservoir at Coundon.

St. Pancras B.C.—The Electricity and Public Light-[illegible] Committee have been instructed to report upon a proposal by the chief engineer to expedite the laying of electric mains, including a power main, to Regent's Park electric light station.

MISCELLANEOUS.

Barking U.D.C.—It has been resolved to enlarge the lake in the recreation ground, at an estimated cost of £1,085, and to remove the hedge at the Water-lane [illegible] at a cost of £365.

Blackpool T.C.—A scheme for a new cemetery has been agreed upon, the cost of the work being estimated at £4,000.

Leek U.D.C.—The surveyor, Mr. W. E. Beacham, has received instructions to prepare for each of the [illegible] plans to present to the council had to deal with a scheme for [illegible] the various works.

Maldon R.D.C.—Immediate application is to be made to the Treasury for a development grant, estimated at £5,000, for the purpose of deepening the Woodrope Creek at Tollesbury, to enable it to be navigable by large vessels, and thus add to the facilities of the port.

PERSONAL.

Mr. John Rourke has been appointed county surveyor of Kildare, and will take up his duties on January 1st next.

Mr. Harold Cordon, who has acted as assistant to his father at Belper, has been appointed surveyor to the Forehoe Loam (Norfolk) Rural District Council.

Mr. Basil H. Noble, surveyor to the Alford Urban District Council, has been appointed engineer and surveyor to the Farsley (Yorks) Urban District Council.

Mr. O. Hilton, engineering assistant to the Watford Urban District Council, has been unanimously appointed second assistant surveyor to the Heston and Isleworth Urban District Council. Mr. Hilton is an associate-member of the Institution of Municipal and County Engineers, and a professional associate of the Surveyors' Institution.

Mr. W. R. Crabtree, the surveyor to the Doncaster Rural District Council, had a somewhat unpleasant experience at an East Coast health resort, where he has been spending a holiday. His favourite recreation is water-colour painting. While engaged in this a soldier appeared on the scene, and Mr. Crabtree was promptly taken before an officer. Explanations were scribbled [illegible] establish his *bona fides*, and he was immediately released.

Mr. E. Young Harrison, ASSOC.M.INST.C.E., who, as reported in these columns last week, has been unanimously appointed borough surveyor and water engineer of Guildford, was born at Folkestone in 1879. He was articled to the late Mr. F. D. Clark, ASSOC.M. INST.C.E., the then borough surveyor of Reigate, and on Mr. Clarke's retirement completed his articles with Mr. W. H. Prescott, ASSOC.M.INST.C.E., the succeeding surveyor. He carried out, under Mr. Prescott, the experimental bacterial works and assisted in the preparation of plans for the works of sewage disposal, also the plans for new infectious diseases hospital. He acted as resident engineer on a pumping scheme with Shone's ejectors and air compressors for three low-lying districts, and his designs for municipal buildings, fire station and police offices were awarded third premium in open competition. In 1899 he was appointed district surveyor and private street works assistant at Richmond, Surrey, and among the other works upon which he was engaged were street improvements, additions to corporation depot, foul and surface water sewers, clearing Red Lion-street insani-

MR. E. YOUNG HARRISON.

surveyor and water engineer to the Wellingborough Urban District Council. During the succeeding 8½ years he has carried out extensions to the duplicate sewerage system, new power plants to water-pumping stations, and water-softening works, depot buildings, reinforced-concrete water tank, bandstands, public conveniences, river bathing place, important street improvements, and the tar-macadamising of a considerable mileage of streets. He is a member of the Institution of Civil Engineers, and of the Institution of Mechanical Engineers, and a member of the Institution of Municipal and County Engineers and of the Institution of Water Engineers.

FOR OTHER ADVERTISEMENTS
See End of Paper.

EXPERIENCED CIVIL ENGINEERS (age 30 to 35) willing to give their services unreservedly to the disposal of the War Office during the war should at once send particulars of their experience, age and remuneration required to Hugh P. Barker, M.I.C.E., 63 Temple Row, Birmingham.

N.B.—Any particulars sent will be registered for reference when required, but cannot be individually acknowledged, and no questions can at present be answered except by correspondence. (1,895)

BOROUGH OF GODALMING.
ASSISTANT IN SURVEYOR'S OFFICE.

An Assistant is required to take charge of plans and tracings, and the general work of the Surveyor's Office, at a salary of 30s. weekly.

Applicants must be experienced draughtsmen, have a knowledge of surveying and levelling, and have had previous experience in sewerage work.

Applications, with copies of three testimonials, endorsed "Assistant," to be sent to the undersigned not later than Tuesday, 22nd September, 1914.

ALAN BROMLY,
Borough Surveyor.

Municipal Offices,
Godalming.
September 2, 1914. (1,885)

TEMPORARY ASSISTANT required at once in the Surveyor's Office, Hayes. Must be a good draughtsman, accustomed to the design of Cottages and able to make small surveys. Salary, £2 per week. Apply, in writing only, stating age and experience, to the Surveyor, Council Offices, Hayes, Middlesex. (1,886)

BOROUGH OF OSSETT
FIRE BRIGADE.

Wanted, an experienced Motor Fire Engine Driver and Storekeeper at the Corporation Depot. Applicants should have a good practical knowledge of Motor Fire Engines and Repairs.

Wages, 30s. per week, with house, coal and gas free. A list of duties may be obtained from the undersigned.

Applications, together with copies of two recent testimonials, or references, to be forwarded to T. W. Wilson, Esq., Town Clerk, Ossett, and endorsed "Motor Fire Engine Driver and Storekeeper," not later than 10 a.m., September 14th, 1914.

H. HOLMES, M.INST.C.E.I.,
Borough Surveyor.

September 2, 1914. (1,894)

COLWYN BAY AND COLWYN URBAN DISTRICT COUNCIL.
REFUSE DESTRUCTOR.

The above Council are prepared to receive Tenders from experienced firms for the erection of a Refuse Destructor, with Steam Boiler, Auxiliary Machinery, &c., complete.

Copies of the General Conditions, Specification, Form of Tender and Plans, may be obtained from the Consulting Engineer, Mr. E. M. Lacey, M.INST.C.E., 2 Victoria street, Westminster, S.W., on payment of a deposit of five guineas, which will be refunded on receipt of a *bonâ-fide* Tender. Duplicate copies can be obtained on payment of one guinea, which will not be returned. Any further particulars may be obtained from Mr. William Jones, ASSOC.M.INST.C.E., the Council's Engineer and Surveyor, Council Offices, Colwyn Bay.

Tenders must be in the form attached to the Specification, and must be delivered to me not later than 11 o'clock in the forenoon on Thursday, the 8th day of October, 1914, in sealed envelopes, endorsed "Tender for Refuse Destructor."

The Council do not bind themselves to accept the lowest or any of the Tenders sent in.

JAMES AMPHLETT,
Clerk to the Council.

Municipal Offices,
Colwyn Bay.
September 2, 1914. (1,896)

THE SURVEYORS' INSTITUTION
(Incorporated by Royal Charter),
12 Great George-street, Westminster, S.W.

EXAMINATIONS, 1915.

PRELIMINARY EXAMINATION.

Notice is given that the Preliminary Examination for the admission of Students will be held on the 13th and 14th of January next.

Candidates from the counties of Lancashire, Cheshire, Yorkshire, Durham, Cumberland, Westmorland, Northumberland, Staffordshire, and North Wales will be examined at Manchester. Candidates from other counties in England and Wales will be examined in London.

Irish Candidates will be examined in Dublin.

Scottish Candidates in Glasgow.

PROFESSIONAL EXAMINATIONS.

Notice is also given that the Annual Professional Examinations for Land Agents, Valuers, Building and Quantity Surveyors (held under the provisions of the Charter) will be held on the 22nd to 26th of March next inclusive.

MINING SURVEYORS' EXAMINATION.

The newly instituted Examinations for Mining Surveyors will be held at the same time.

All English Candidates for the Professional Examinations are examined in London.

Irish Candidates in Dublin.

Scottish Candidates in Glasgow.

All applications for both the Preliminary and the Professional Examinations must be sent in before the end of September. The necessary Entry Forms for the various Examinations, and particulars as to subjects, course of examination, prizes and scholarships can be obtained of the Secretary. (1,897)

The Town Planning Procedure Regulations, 1914.*

By HENRY E. STILGOE, M.INST.C.E., City Engineer and Surveyor of Birmingham

[illegible] board that it was desirable to amend the Procedure [illegible] the President of the Local Government Board, on December 5, 1913, when the President gave very careful attention to the matter and before [illegible] work entailed in the preparation of town planning [illegible].

The following notes will serve to point out the principal [illegible] the new regulations.

Article II.—The reduction, from two months to four weeks, for the period required to elapse between the [illegible] and the application to the board for authority to prepare the scheme, is a distinct advantage. To appreciate the effect of this alteration it must be remembered that the land becomes "bound" for the purposes of the scheme (as indicated in sec. 58, subsec. 2 of the Act) from the date of the application by the local authority for permission to prepare a scheme. Under the original regulations the preliminary notice was given to owners, &c., two months before this date, during which period they could commit acts (such as entering into building agreements, &c.) prejudicial to the scheme. The reduction of this interval to four weeks minimises, but does not remove, the danger. The remedy suggested by the institution was that the land should be "bound" from the date of the notice to owners, &c., of the intention to prepare the scheme, instead of from the date of the application. The omission of all requirements as to service of notices on occupiers of lands will be a great saving of time and money, and, as will be observed under Article XXVII, of the new regulations, the word "owner" or "owners" has the same meaning as in the Lands Clauses Acts.

Article III.—The first meeting of owners required under the original regulations may be dispensed with, in accordance with the alternative set out in Article III. This alternative is the serving of notice upon the "prescribed persons" that the local authority is prepared to confer with them. This need not be a separate notice, but may be included in the first notice (required by Article II., c.).

Article IV.—Map No. 2 is required to be submitted to the board with the application by the local authority for permission to prepare a scheme. Map No. 1 may be converted into Map No. 2 by the addition of certain further particulars. It is a great relief that it is now unnecessary to show the sewers, and the gas, water, electric and other mains upon this map. It is, however, necessary to show the new buildings—that is to say, to bring the Ordnance Survey map up to date, and show such new buildings by a distinctive colour. The regulations do not demand it, but it is presumed that new streets constructed since the date of the latest edition of Ordnance Survey must also be shown.

Article V.—Under the old regulations, among the documents, &c., to accompany the application for permission to prepare a scheme was "Map No. 3," which was to the scale of 1 in. to the mile, and showed by distinguishing colours, the district of the local authority, the land included in the scheme, and the area within 5 miles from any part of the district of the local authority. In the new regulation this map is not required.

Article V. (*g*).—When applying for authority to prepare a scheme, it is necessary, under the new regulations, to give information as to the need for improved means of communication (widenings of streets and proposed construction of new streets), as to stopping up and diverting roads, and as to the allocation of lands for open spaces, &c. Such information was not required as a statement under the original regulations, but had to be shown on Map No. 2 instead.

* [illegible]

Article VI.—The board, [illegible] the [illegible] schedule of the Act, ask for an estimate of the cost [illegible] to prepare [illegible] expenditure [illegible] the application, and (2) any other local authority, shall be indicated." The estimate, if it is of any use [illegible] to make it; therefore the local authority preparing the scheme must have given very considerable thought to the proposed roads, open spaces, and other matters; [illegible] As a town planning scheme will include the works incidental to planning and laying out of streets, the acquiring of lands for open spaces, &c., many of which works it is not necessary to carry out for several years, it will be appreciated that as development proceeds it may be necessary to vary portions of the scheme. [illegible] is concerned, it is only useful and necessary to include [illegible] of the preparation of the scheme, and of acquiring the properties necessary for the laying out of streets, and for open spaces, allotments, &c.

Article VIII provides that, when authority has been given by the board for the preparation of a scheme by a local authority, notice shall be given by advertisement in a local newspaper. This dispenses with the serving of individual notices required under the original regulations.

Article X.—When the local authority have fully considered and developed their proposals, they shall cause to be printed a draft scheme embodying these proposals, and shall cause Map No. 3 (new number) to be prepared. This map is to have shown upon it very much the same information as was required by the old regulations for Maps Nos. 2 and 4, except that it is unnecessary to show the sewers, gas, water and electric mains, &c.

Article XIII.—When the local authority have decided upon the scheme to be submitted to the board for their approval, they shall make an Order under their Seal, and shall prepare Map No. 4, provided that if [illegible] identical with Map No. 3, then Map No. 3 may be used for the purpose of Map No. 4. As, in many cases, it will be found that Map No. 4 will not be identical with Map No. 3, it would appear reasonable that the board should allow, where practicable, Map No. 3 to be amended in some distinctive manner, [illegible] and become Map No. 4. This would save a good deal of unnecessary expense. The amended regulations indicate that the board would be willing to adopt such a course, for after the words "identical in all respects" have been added the words "or if the board consent under Article XXVI.," which Article provides that the board may dispense with or vary the requirements of the regulations.

Article XV.—Map No. 5 (the Ownership Map) is required to be submitted by the local authority to the board when making application for the board's approval to the scheme. Under subsec. (*f*) the names and addresses of the owners of each parcel of land included in the scheme, and the approximate extent of each such parcel, must be supplied. This, in the case of areas built up with a lot of small property, would entail a great deal of work, and it does not appear that the result will be useful. Perhaps the board will relax this requirement under the powers conferred upon them by Article XXVI. It will be observed that the map to the scale of 6 in. to the mile, known as Map No. 6 under the original regulations, is not now required.

Article XVI.—An estimate of expenditure and receipts is required in the same terms as was formerly required under Article XXII. of the old regulations. (See remarks as to estimate under Article VI. above.)

Article XVIII.—When the Local Government Board send to the local authority a draft order approving the scheme, it is not necessary (as under the original regulations) to send a copy of the Order to owners, lessees and occupiers, &c.; a notice to the prescribed persons that the draft Order has been received and may be inspected, &c., is all that is required.

Article XXVII (interpretation of terms) states that the word "owner" or "owners" has the same meaning as in the Lands Clauses Acts. The Lands Clauses Consolidation Act, 1845, gives the following definition:

"Where, under the provisions of these or the special Act, or any Act incorporated therewith, any notice shall be required to be given to the owner of any lands, or where any such shall be authorised or required to be done with the consent of any such owner, the word 'owner' shall be understood to mean any person or corporation who, under the provisions of [illegible] or the special Act, would be entitled to sell and convey lands to the promoters of the undertaking."

Article XXVIII. revokes the original regulations [1910, except in so far as they apply to the adoption by the local authority of any scheme prepared by any owner or owners of land.

[The foregoing notes refer to the more important alterations, but we would recommend those of our readers who desire fuller information to obtain a full copy of Mr. Stilgoe's paper, which contains a table comparing, article by article, the new regulations with the original regulations, so far as the latter have been altered or added to.]

On the presentation of Mr. Stilgoe's paper at the annual meeting of the Institution of Municipal and County Engineers at Cheltenham,

Mr. J. W. Cockrill (Yarmouth) proposed a vote of thanks to Mr. Stilgoe.

Mr. T. Adams (Local Government Board) said that at the Yarmouth conference he was asked to convey to the board a resolution passed by them regarding the procedure in dealing and the result was due, in large measure, to that resolution. The board invited a deputation from the institution to meet them, with the result that the necessary amendments were made. Any question of recasting the regulations in future would probably require an amending Act, and whether that was desirable or not he could not say.

Mr. J. A. Brodie (Liverpool) said that Mr. Stilgoe's paper would be very valuable so long as regulations of a somewhat complicated nature were necessary in connection with town planning. Municipal engineers, however, were not too keen on regulations of this type, and hoped that when the law on town planning came to be simplified care would be taken that the municipalities were given a freer hand than at the present time, since a good deal of the work could be cut down in many respects.

The President (Mr. J. S. Pickering) also expressed his thanks to Mr. Stilgoe for a paper which he said would be of great service for a long time to come.

The vote of thanks was then duly accorded.

KENT ROADS.

NEW COUNTY SURVEYOR'S REPORT.

Mr. H. T. Chapman, who recently succeeded Mr. Maybury as county surveyor of Kent, has issued his first annual report upon the maintenance and repair of the rural main roads of the county, and of main roads situated in non-retaining urban areas. The total mileage is 600½.

The actual cost of maintenance, tar-painting and improvement work carried out during the year ended March 31st last was £157,421. Towards this expenditure £30,272 was actually received in the account year from the Road Board, £1,960 19s. 8d. is a credit due in respect of repairs to roads over railway and county bridges, and the sum of £1,120 8s. 1d. is also a credit in respect of contributions received towards the cost of improvements, scavenging, repairs to trenches, sale of old iron, &c., leaving a net expenditure of £124,067 18s. 2d. out of county funds, which equals £206·6 per mile.

Over £52,516 was expended upon tar-painting, widenings, bridge construction, kerbing, channelling, paving and drainage works, and represents £87·4 per mile.

In arriving at this figure it must, however, be borne in mind that credit has not been taken, as has been the custom in previous years, for the amounts received in respect of fees for traction-engine licences, drivers' licences, and the registration of motor cars. These receipts during the year under review amounted to £5,634 1s.

The total cost of tar-painting carriageways amounted to £26,195 16s. 5d., 956,625 gallons of tar having been used, the area treated being, approximately, 5,750,000 super. yds. There was also 22,086 gallons of tar used in the repairing of footpaths.

The payments for tar alone represented £11,996 3s. 11d., the average price paid per gallon being 2·9d.

To the urban authorities the county council paid £7,136 for the tar-painting of 1,532,868 super. yds. of carriageways. Tar-painting proper, therefore, cost the county council during the year £23,332.

During the year 3,208½ tons of pitch and 204½ tons of bitumens were used as a matrix for binding granite macadam and "carpeting" work. The cost of this material was over £10,579.

A table in the report shows that the total quantity of material used upon the roads under direct control was 134,185 tons or yards.

The area of carriageway so treated was 751,490 super. yds., or, approximately, one-eighth of the whole.

The average price per ton for stone metalling, exclusive of haulage, was 10s. 11·34d., as compared with 10s. 3·12d. in the previous year, this being an increase of 8·22d. Of the total quantity of material used 34,450 tons consisted of granite macadam, and 18,735 tons of Kentish rag tarred macadam.

Mr. Chapman gives as the average daily cost of working a steam roller, including repairs, coal, oil, waste, scarifying tynes, insurance, driver and attendant, the figure of 20s. 3d., that of a steam motor, including all charges, £1 2s. 3d., and that of a petrol heavy motor £1 12s. 7d.

The total cost of haulage during the year amounted to £17,844, of which £9,846 6s. 10d. was in respect of hired team labour and mechanical haulage.

Mr. Chapman remarks that attention has frequently been drawn to the enormous amount of damage caused to the main roads by the heavy traffic which is being put upon them, and which is increasing daily. The water-bound macadam roads are quite unable to withstand the traction engines, steam and petrol motors and motor omnibuses now using all the important main roads, and especially so when the crust is weak and the subsoil consists of clay. Mr. Chapman finds that the quarters of the roads are in many places becoming distorted and pushed out by this traffic, which now uses the sides to a much greater extent than formerly, owing to the large amount of quick motor-car traffic. "Considerable expenditure will, therefore," he says, "be involved in strengthening the roads before resurfacing them, and I think the Road Board should be urged to contribute largely towards this necessary work in addition to the cost of surfacing with improved materials. Pitch-grouting and local tarred macadam form an excellent base, and I trust we shall, with the aid of the Road Board, be enabled to coat large areas with a surfacing consisting of local gravel and sand, treated with natural bitumens."

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. S. Pickering, M.Inst C.E., Borough Surveyor and Water Engineer, Cheltenham.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

J. W. Dudley Robinson, B.Sc.(Lond.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. Horace Boot, M.I.E.E., M.I.Mech.E.

Meetings will be held at Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

B. Wyand,
Secretary.

39 Victoria-street, S.W.

ROYAL SANITARY INSTITUTE.

YORK MEETING.

On Saturday, October 24th, at a meeting of the Royal Sanitary Institute in York, Mr. E. W. Spon, [illegible] on "The Engineering Works of the Borough Engineer of the York Sewage [illegible]."

In connection with the meeting the pumping station at Naburn, and the works at Naburn and Lotherton, [illegible] will be visited.

The 5th session of lectures and examinations for sanitary officers will commence on Monday, 5th October, 1914.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

INSPECTOR OF NUISANCES, SANITARY SURVEYOR, AND SURVEYOR OF HIGHWAYS.—September 7th. Uxbridge Urban District Council. £110 per annum. Mr. Frank E. Hawthorn, clerk, Council Offices, Uxbridge.

ASSISTANT TO COUNTY SURVEYOR. September 7th. Pembrokeshire County Council. £150 per annum. Mr. Arthur H. Thomas, county surveyor, Haverfordwest.

SURVEYOR. September 7th. Orpington Town Council. £200 per annum. Mr. J. J. Newcombe, town clerk.

CLERK OF WORKS. September 7th.—Bedwellty Urban District Council. £3 per week.—Mr. T. J. Thomas, clerk, 36 High-street, Bargoed.

INSPECTOR OF NUISANCES.—September 8th—10th. Leigh Rural District Council. £120 per annum.—Mr. E. Williams, clerk, 5 Market-place, Leigh.

DRAUGHTSMAN AND ARCHITECTURAL ASSISTANT. September 8th. Morley Town Council. Mr. Fred Thackray, town clerk.

ASSISTANT SURVEYOR.—September 12th.—Swansea Rural District Council. £120 per annum.—Mr. E. Harris, clerk, Alexandra-road, Swansea.

ASSISTANT SURVEYOR.—September 12th.—Devon County Council. £150—£200.—Mr. R. M. Stone, county surveyor (No. 1 Division). The Square, Barnstaple.

TEMPORARY SURVEYOR'S ASSISTANT.—September 14th.—Aylesbury Urban District Council. £75 per annum.—Mr. W. Harold Taylor, engineer and surveyor.

BUILDING INSPECTOR.—September 14th.—West Ham Town Council. £150—£200 per annum.—Mr. H. W. Greaves, town clerk.

CLERK OF WORKS.—September 14th.—Aberystwyth Rural District Council. £3 3s. per week.—Mr. H. Hughes, clerk, 8 Market-street.

ENGINEERING ASSISTANT.—September 14th.—Watford Urban District Council. £80—£100 per annum. Mr. D. Waterhouse, engineer.

SURVEYOR AND ENGINEER.—September 14th.—Wellingborough Urban District Council. £350 per annum.—Mr. J. T. Parker, clerk, 29 Church-street, Wellingborough.

ELECTRICAL ENGINEER.—September 15th.—Corporation of Swansea. £500 per annum.—Mr. H. L. Coath, town clerk.

DIVISIONAL SURVEYOR.—September 15th.—West Suffolk County Council. £145 per annum.—Mr. W. L. Jenkins, county surveyor, Shire Hall, Bury St. Edmunds.

BOROUGH SURVEYOR.—September 15th.—Corporation of Swansea. £500 per annum.—Mr. W. Lang Coath, town clerk, Guildhall, Swansea.

CHIEF DRAUGHTSMAN.—September 30th.—City of Westminster. £200—£250 per annum.—Mr. John Hunt, town clerk, City Hall, Charing Cross-road, W.C.

ARCHITECTURAL AND SURVEYING ASSISTANT.—Middlesex County Council.—Mr. H. T. Wakelam, county engineer, Middlesex Guildhall, Westminster, S.W.

ASSISTANT ENGINEER. Nyassaland Public Works Department. £200 £300. Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

BOROUGH ENGINEER AND SURVEYOR. Corporation of Salford. £900 £1,100. Mr. L. C. Evans, Town Clerk, Town Hall, Salford.

ENGINEERING AND SURVEYING ASSISTANTS in Middlesex County Council.—Mr. H. T. Wakelam, county engineer, Middlesex Guildhall, Westminster, S.W.

FOREMAN OF WORKS. Nigeria. £250 £300. Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

INSPECTOR OF WATERWORKS.—Federated Malay States. £180 £280. Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ASSISTANT CLERK OF WORKS.—Barrow-in-Furness Town Council. £2 10s. per week.—Borough Engineer and Surveyor.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

GATESHEAD. September 10th. Designs for a school for 700 scholars, for the Education Committee. The Clerk to the Committee, Town Hall.

GLASGOW. September 18th. Plans for buildings proposed to be erected at the north-west corner of Trongate and High-street. Premiums, £50, £30, and £25.—Mr. J. Lindsay, town clerk.

ST. HELENS.—October 31st.—Drawings of police buildings and fire station, for the St. Helens Corporation. Premiums, £100, £50, and £25.—Mr. A. W. Bradley, borough engineer.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Buildings.

BIRMINGHAM.—September 7th.—For alterations to public baths, for the corporation.—Mr. R. Hoggins, superintendent engineer, Kent-street, Birmingham.

LEEDS.—September 7th.—For the extension of the meat market, for the corporation.—Mr. W. S. Braithwaite, architect, 6 South-parade.

SHEERNESS.—September 7th.—For the demolition of engine-house and the construction of a new building and other works, for the urban district council.—Mr. F. W. S. Stanton, engineer, 3 Victoria-street, Westminster, S.W.

WEST RIDING.—September 7th.—For widening a bridge, for the county council.—Mr. F. G. Carpenter, West Riding surveyor, County Hall, Wakefield.

GLASGOW.—September 8th.—For the erection of a shelter and convenience, for the corporation.—Messrs. F. Burnet & Boston, 180 Hope-street, Glasgow.

HAMPSHIRE.—September 8th.—For the erection of a police cottage, for the county council.—Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

ILFORD.—September 8th.—For the erection of workshops at the electricity works, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

NEWPORT (Mon.).—September 8th.—For alterations to fire station and erection of firemen's dwellings, for the corporation.—Mr. C. F. Ward, borough architect, Town Hall.

ILFORD.—September 8th.—For the erection of refuse destructor buildings, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

WELLINGBOROUGH.—September 8th.—For the erection of a public convenience, for the urban district council.—Mr. E. Y. Harrison, surveyor.

YORK.—September 9th.—For the erection of a shelter, for the corporation.—Mr. F. W. Spurr, city engineer, Guildhall.

KENT.—September 9th.—For the execution of works at certain schools, for the Education Committee.—Mr. W. H. Robinson, architect, Sessions House, Maidstone.

STOCKPORT.—September 9th.—For the erection of a mortuary, for the corporation.—Mr. J. Atkinson, borough surveyor.

FARNWORTH.—September 12th.—For the erection of a school, for the Education Committee.—Mr. H. Littler, county architect, 16 Ribbleshale-place, Preston.

CORNWALL.—September 12th.—For the erection of a school, for the Education Committee.—Mr. B. C. Andrew, architect, Biddick's-court, St. Austell.

EVESHAM.—September 12th.—For the erection of forty-six cottages, for the rural district council.—The Clerk.

HALIFAX.—September 14th.—For the erection of a science shed and alterations to existing buildings, for the corporation.—Mr. J. Lord, borough engineer.

BRADFORD.—September 16th.—For the erection of eight workmen's dwellings, for the corporation.—Mr. F. Stevens, town clerk.

BRISTOL.—September 17th.—For the erection of a school (builder's and plumber's work), for the Education Committee.—Mr. W. S. Skinner, architect, 27 Orchard-street, College-green, Bristol.

DERBYSHIRE.—September 18th.—For the erection of two schools, for the Education Committee.—Mr. G. H. Widdows, architect, County Offices, St. Mary's Gate, Derby.

CAMBRIDGE.—September 19th.—For the erection of cottages, for the corporation.—Borough Surveyor.

ILFORD.—September 22nd.—For the erection of a sanatorium, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

BOMBAY.—January 7th.—For the complete manufacture, erection and equipment of a refuse destructor for the incineration of 200 tons of refuse per day, for the municipality.—Mr. P. R. Cadell, municipal commissioner, Municipal Offices, Bombay, India.

Iron and Steel.

DUNDEE.—September 7th.—For the supply of cast-iron pipes, for the Water Commissioners.—Mr. G. Baxter, engineer and manager, 93 Commercial-street, Dundee.

EDINBURGH.—September 8th.—For the supply of 400 tons of 9-in. dry sand cast-iron pipes, for the Water Trustees.—Messrs. J. & A. Leslie & Reid, 12 St. Giles-street, Edinburgh.

MANCHESTER.—September 15th.—For the supply and erection of steel storage shelving, for the Tramways Committee.—Mr. J. M. McElroy, general manager, corporation tramways, 55 Piccadilly, Manchester.

KEIGHLEY.—September 5th.—For the supply of cylinders for reservoir works, for the corporation.—Mr. M. R. Barrett, engineer, Town Hall.

Roads.

PERTHSHIRE.—September 5th—14th.—For work of road construction, for the Eastern District Committee.—Mr. G. Wyllie, road surveyor, Blairgowrie.

LLANDUDNO.—September 7th.—For work of road construction, for the Joint Committee.—Mr. W. T. Ward, engineer, Town Hall, Llandudno.

SUNBURY.—September 7th.—For the reconstruction of two roads, for the urban district council.—Mr. H. F. Coales, engineer, Council Offices, Sunbury-on-Thames.

SOUTHAMPTON.—September 7th.—For the execution of private street works, for the corporation.—Borough Engineer.

ITCHEN.—September 7th.—For executing works in certain roads, for the urban district council.—Mr. T. A. Collingwood, surveyor.

REIGATE.—September 7th.—For the supply of road materials, for the corporation.—Mr. F. T. Clayton, borough surveyor.

ILFORD.—September 7th.—For making up certain roads, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

DEVIZES.—September 7th.—For scarifying and steam rolling, for the rural district council.—Mr. S. W. Saunders, surveyor.

STEYNING EAST.—September 7th.—For the supply of 360 tons of 2-in. granite, and 100 tons of granite chippings, for the rural district council.—Mr. G. W. Warr, surveyor.

LEEDS.—September 7th.—For laying tramway track in certain roads, for the corporation.—Mr. J. B. Hamilton, General Manager of Tramways, Town Hall.

BRIGHTON.—September 8th.—For the supply of dressed kerb and channel, for the corporation.—Borough Surveyor.

HORNSEY.—September 8th.—For grading and tar-paving a school playground, for the Education Committee.—Engineer and Surveyor, Town Hall, Hornsey, N.

CLUTTON.—September 8th.—For steam rolling and scarifying, for the rural district council.—Mr. J. S. Drury, clerk, Temple Cloud, Bristol.

WILLESDEN.—September 8th.—For the supply of Norway or other granite, for the urban district council.—Mr. O. Claude Robson, engineer, Municipal Offices, Dyne-road, Kilburn, N.W.

ROCHDALE.—September 9th.—For making up certain streets, for the corporation.—Borough Surveyor.

BATH.—September 9th.—For making good certain private streets, for the corporation.—Mr. C. R. Fortune, city surveyor.

BARROW.—September 9th.—For road construction, for the corporation.—Borough Engineer.

BURY (Lancs).—September 12th.—For private street works, for the corporation.—Borough Engineer and Surveyor.

BRITON FERRY.—September 12th.—For the supply of broken granite or basalt road metalling, delivered in quantities required, for the urban district council.—Mr. H. Alex. Clarke, engineer and surveyor.

BEDFORD.—September 12th.—For the supply of broken granite, ironstone slag, and ironstone slag macadam, for the corporation.—Mr. N. Greenshields, borough engineer and surveyor.

DERBYSHIRE.—September 14th.—For roadways and pathways at Walton sanatorium, for the county council.—Messrs. W. H. Ward, architects, Paradise-street, Birmingham.

LEWISHAM.—September 15th.—For work of street construction, for the borough council.—Borough Surveyor.

HAMBLEDON.—September 15th.—For making up a private street, for the rural district council.—Mr. S. B. Hasell, surveyor, High-street, Bramley.

STEVENAGE.—September 21st.—For the supply of 800 tons of clean chippings and dust, and broken Guernsey, Leicester, or other granite, for the urban district council.—Mr. W. O. Times, clerk.

RHONDDA.—September 22nd.—For making up certain streets, for the urban district council.—Mr. E. H. Barber, engineer and surveyor, Pentre.

CROYDON.—September 24th.—For making up a certain road, for the rural district council.—Mr. R. M. Chart, surveyor.

LAMBETH.—September 24th.—For the construction of road foundations, for the borough council.—Mr. Henry Edwards, borough engineer.

GATESHEAD.—September 29th.—For paving work, for the corporation.—Mr. N. P. Pattinson, borough engineer.

TANGIER.—October 3rd.—For road construction, for the Moroccan Adjudications Commission.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

Sanitary.

HEXHAM.—September 5th.—For the execution of a scheme of main drainage and sewage disposal, for the rural district council.—Messrs. D. Balfour & Son, 3 St. Nicholas-buildings, Newcastle-on-Tyne.

ST. ALBANS.—September 5th.—For works of sewerage, consisting of pipe sewers, manholes, flushing apparatus, gullies, and connections, for the corporation.—Mr. H. Humphreys, engineer, 28 Victoria-street, Westminster, London, S.W.

MOTTRAM.—September 5th.—For cleansing and emptying closets and ashpits, for the urban district council.—Mr. S. Hudson, inspector.

WILLINGTON.—September 5th.—For the construction of sludge beds and drainage, for the urban district council.—Mr. J. H. Gardner, surveyor.

ITCHEN.—September 7th.—For work of surface-water drainage, for the urban district council.—Mr. T. A. Collingwood, surveyor, Woolston.

WHICKHAM.—September 7th.—For the construction of sewers and roadways, for the urban district council.—Mr. J. B. Renton, surveyor.

STOKE.—September 21st.—For the construction of sewers and sewage disposal works, for the rural district council.—Messrs. Chapman & Snape, engineers, Norfolk-street, Lynn.

EARLEY.—September 9th.—For supplying and laying about 500 yds. of 9 in. glazed stoneware socket sewer, at Longworth, for the rural district council.—Mr. H. Cecil Wilson, engineer, Reading, Berks.

[illegible].—September 9th.—For carrying out the Outfall Sewage Scheme.—Mr. W. T. Wardle, surveyor.

CLAYDON.—September 9th.—For the removal and disposal of the contents of ashpits, for the urban district council.—Mr. R. Biggin, Clerk's Office.

SHIRLEY.—September 9th.—For constructing works at the sewage disposal works, for the urban district council.—Messrs. W. Paterson & J. M. Nicholson, 19 Lower Temple-street, Birmingham.

HAVANT.—September 9th.—For the removal of earth-closet soil, ashes, and house refuse, for the rural district council.—The Surveyor.

KIRKCALDY.—September 9th.—For the construction of two culverts, for the corporation.—Burgh Surveyor.

RHYMNEY VALLEY.—September 9th.—For the construction of brick outfall sewer, about 10 miles long, for the Sewerage Board.—Messrs. Wilcox & Raikes, 9 Victoria-street, Westminster, and Mr. T. J. Thomas, 36 High-street, Bargoed, Glam.

CHEADLE.—September 10th.—For the enlargement and extension of the sewage disposal works, for the rural district council.—Mr. F. T. Inskip, surveyor, Brook House, Cheadle, Staffs.

COCKERMOUTH.—September 12th.—For laying 2,500 yds. of sewers and constructing manholes and flushing chambers, for the rural district council.—Mr. J. B. Wilson, Grecian Villa, Cockermouth.

DOWNPATRICK.—September 12th.—For the construction of a sewer, for the rural district council.—Mr. R. L. Morrow, clerk.

BANBURY.—October 3rd.—For the construction of about 1 mile of 18-in., 15-in., and 9-in. cast-iron and stoneware pipe sewers, with manholes, storm overflow chamber, erection of engine-house, refuse destructor-house, and other works, for the corporation.—Messrs. Willcox & Raikes, Union Chambers, 63 Temple-row, Birmingham.

ALEXANDRIA.—December 8th.—For the construction of a sewerage system, for the municipality.—"M. le Président de la Commission Municipale d'Alexandrie," Alexandria.

Miscellaneous.

WHICKHAM.—September 7th.—For laying out a proposed cemetery and garden house, for the urban district council.—Mr. J. B. Renton, surveyor.

KINGSTON-UPON-THAMES.—September 9th.—For the construction of a movable flooring over swimming bath, for the corporation.—Mr. R. Hampton Clucas, surveyor.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

LISKEARD.—For the supply of road materials, for the rural district council.—Mr. T. E. Ware, surveyor.

Guernsey.—J. Mowlem & Co., Westminster, S.W.
Quenast.—London Granite Company, Great Tower-street, E.C.
Jersey.—Croft Granite Company, Leicestershire.
To Various Stations in the District.—Prices for broken granite and chippings, from 16s. 4d. to 11s. 3d.

GWYRFAI.—For the erection of thirty-six workmen's dwellings, for the rural district council.—Mr. J. W. Thomas, surveyor, Carnarvon:—

OCTOBER.

24. Royal Sanitary Institute: Meeting at York. Discussion on "Biological Treatment of the York Sewage."

APPOINTMENTS WANTED.

Prepaid *Advertisements under this heading are inserted at the rate of* One Penny *per word, with a minimum charge of 2s.* Three *consecutive insertions given for the price of* Two.

SURVEYOR'S ASSISTANT, 22, Stud.I.M. & Cy.E., surveying, levelling, preparation of plans and sections, keeping of all books, general office work. Low wage where experience can be gained.—Apply Box 1,462, office of The Surveyor, 24 Bridle-lane, Fleet-street, E.C. (1,893)

TENDERS WANTED.

CORPORATION OF BANBURY.
BANBURY SEWERAGE AND SEWAGE DISPOSAL.

The Corporation of Banbury invites Tenders for the construction of about 1 mile of 18-in., 15-in., 12-in. and 9-in. Cast-iron and Stoneware Pipe Sewers, together with Manholes and Storm Overflow Chamber, the erection of Engine-house, Refuse Destructor House and Chimney Stack, the construction of Screening Chambers, Pump Well, Storm Tanks, the provision and laying of about 1,200 yds. of 15-in. Cast-iron Rising Main, and of other works incidental to the scheme.

Plans and Specification may be seen at the office of the Engineers, Messrs. Willcox & Raikes, Union Chambers, 63 Temple-row, Birmingham, from whom copies of the Bills of Quantities and Form of Tender may be obtained on or after the 7th day of September on payment of a deposit of Five Guineas, which will only be refunded on receipt of a *bonâ-fide* Tender and the return of all documents to the Engineers.

Sealed Tenders, in envelopes supplied, and endorsed "Banbury Sewerage Contract No. 1," to be delivered at my office not later than 12 o'clock noon on the 3rd day of October, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender.

(By order)
ARTHUR STOCKTON (Solicitor),
Town Clerk.

BRITON FERRY URBAN DISTRICT COUNCIL.

TENDERS FOR BROKEN GRANITE, &c.

The Urban District Council of Briton Ferry invite Tenders for the supply of Broken Granite of Road Metalling quality in the district required.

Terms, Form and Specification can be obtained upon application to the undersigned.

Sealed Tenders, endorsed "Tender for Granite," to be delivered at my office on or before Saturday, the 5th day of September, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

H. ALEX. CLARKE,
Engineer and Surveyor.

Council Offices,
Briton Ferry.
August 31, 1914. (1,880)

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of vacancies. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

WANTED, for three months, the services of a thoroughly qualified Engineering and Surveying Assistant. Only those fully acquainted with the use of the theodolite and the calculating of quantities of earthworks, &c., and having practical experience in the work of carrying out and construction of road and railway works need apply. Salary three guineas per week. Apply Box 1,459, office of THE SURVEYOR, 24 Bridge-lane, Fleet-street, E.C. (1,887)

COUNTY BOROUGH OF SWANSEA.

APPOINTMENT OF BOROUGH SURVEYOR.

The Corporation of Swansea invite applications from duly qualified Surveyors under 45 years of age for the appointment of Borough Surveyor.

Commencing salary £500 per annum.

Applications, stating age, qualifications, and experience, accompanied by copies of not more than three recent testimonials (which will not be returned), endorsed "Borough Surveyor," to be sent to me the undersigned (from whom particulars of the duties of the office can be obtained) not later than 12 o'clock noon on Tuesday, the 15th day of September, 1914.

Canvassing, either directly or indirectly, is strongly objected to, and is strictly prohibited, and any candidate pursuing the practice will be disqualified.

H. LANG COATH,
Town Clerk.

Guildhall, Swansea.
August 21, 1914. (1,869)

AYLESBURY URBAN DISTRICT COUNCIL.

Applications are invited for the appointment of Temporary Surveyor's Assistant. Salary at the rate of £75 per annum. The person to be appointed must be a good Draughtsman and Surveyor, and possess practical knowledge of the work of a Municipal Engineer's Office.

Applications, stating age and experience, together with copies of three recent testimonials, must be sent to the undersigned not later than noon on Monday, September 14, 1914.

WM. HAROLD TAYLOR,
Engineer and Surveyor.

Town Hall,
Aylesbury. (1,888)

Minutes of Proceedings.

Harmonic Waves in Road Crusts.

In order that we may place before our readers some representative opinions of American engineers on the subject of harmonic waves in road crusts, we have reproduced elsewhere in the present issue a number of extracts from the report of a meeting of the American Society of Engineers held early this year. It has long been understood in this country that undulations in road crusts are caused by rhythmic vibrations of the wheels of vehicles on their springs, these vibrations being started by accidentally formed humps or depressions, or by similar humps and depressions due to local hardness or softness, or strength or weakness in the road crust or the subsoil. Under the conditions of fifteen years ago the effect of vehicles in causing a string of puddles or a succession of humps and hollows usually died out in a short distance, or, where it persisted for a considerable distance, was aided by the presence of hard and soft places, alternating, in the crust. Here the influence of rolling might have been traced, and it was, indeed, sometimes pointed out that on some roads the rollers used were much too heavy, and disturbed the subsoil unduly. Past experience, then, teaches us that one of the factors causing waving of a road surface is the occurrence of "accidental" humps or hollows, such as those caused by trenches made across the road, including, it may be remarked, trenches cut, or to be cut, for the purpose of ascertaining the thickness of the crust. The next question to be considered is to what extent do actual or potential waves caused by rolling result in serious waving of the surface. Potential waves may be caused by actual undulations in the road bed, or by alternating differences in the strength or solidity of the crust; and actual initial waving may be very rapidly increased at the edges by water scour outwards, the undulation then working back towards the middle of the road. It is certain that many engineers believe that initial waving due to rolling is very important. It may certainly be reduced by using a roller which can be gradually loaded up as the work proceeds, by adopting Mr. Reeves' proposal to use low-pressure rollers first and to consolidate with high-pressure rollers, and by cross rolling or slant rolling where the road is wide enough. Provided that Col. Crompton's three-axle roller can conveniently be managed in practice, it can hardly be doubted that it provides another remedy.

If, now, it be admitted that the initial waving due to rolling is fairly general and really the chief factor in producing waves, it cannot logically be argued that rhythmic beating of the road by motor vehicles with their own dominant period of vibration can be a generally accentuating factor—unless by an unlucky chance there are roads on which the wave lengths of the vehicles correspond with those of the initial waves. This correspondence is possible, and should not be altogether put out of consideration, but it is far from probable, and it is certain that it does not exist in the case of light motor vehicles or ordinary motor cars, the waves produced by these vehicles being shorter than the waves due to rolling. Next, however, we have to consider whether the initial waving may lead to a rhythmic thumping by motor vehicles, the period of vibration being that due to the initial waves—not being imposed by dominant qualities of the vehicles themselves. Where the wave lengths are long enough the waving may even be enhanced by a "pitching," in the nautical sense, of the vehicle as a whole, the time period being imposed by the initial waves. The probable truth, then, seems to be as follows: Accidental humps or hollows start vibrations of wheels and axles, and, on roads on which certain classes of vehicles pass in large numbers, there will be waving, the wave lengths being those imposed by this class of vehicles, dominant as regards the wave length. The two chief classes are, first, motor buses and vans of similar size and weight as regards unspring weight and sizes of springs, and, secondly, the heavier classes of touring and private motor cars. The practical remedies are steadily to improve the roads as regards evenness of the road bed, regularity in crust thickness, segregation of material in the crust, and sufficiency of crust thickness. It is also advisable to avoid cross drains which, by making alternations of damp and dry parts of the road, may lead to wave formation. The last-named factor is more important, however, when taken in conjunction with the avoidance of initial waves due to rolling. As regards this the means already suggested may be employed, and at any rate one other factor must be considered. In rolling a road crust it is impossible to obtain the best results if the thickness of the crust varies sharply and frequently. On most old main roads it does. Therefore roads should be remade, the road bed being properly shaped and a sufficient and equal thickness of crust provided. The policy of improving the "surfaces" without carrying out work of this kind may satisfy a "demand," but it is a weak and wrong policy.

* * *

Recent Practice with Ultra-Violet Rays.

The possibilities of sterilisation of water by means of the ultra-violet rays have long been recognised. Comparatively large installations, some of them worked on a commercial scale, have proved the many advantages of the system. We have heard from time to time of the treatment being adopted for large institutions, and even for towns in France, but up to the present time there has been a remarkable scarcity of information as to the practical results of working and as to the cost of the process considered from the point of view of the water engineer. This lack of information as to the working of the process when applied upon a proper commercial scale has certainly delayed the

application of the system in many cases where it would apparently be desirable in this country, for we have no need to try experiments, neither do our water authorities show any great fondness for risking money in the cause of science. It is known that at Marommes les Rouen, France, 100,000 gallons of water per day have been treated; also Max von Recklinghausen, in an article which appeared in *Engineering News* of New York last year, mentioned a town supply in France of 1,700,000 gallons of water per day which was being sterilised by means of the ultra-violet rays. In America the first commercial undertaking for the purification of water by this method was that of Chicago, where bottled water is treated. Nearly a year ago we were also told that the R. U. V. sterilisers in operation represented a total capacity of 10,000,000 gallons per day. All these matters have been dealt with in these pages, but we have again and again expressed our regret that full details were not forthcoming, and that the actual working cost of the process was not made sufficiently clear to justify the water engineer in recommending its adoption.

It is therefore interesting to learn that with characteristic courage and enterprise the city of Niagara Falls, New York, has decided to instal a large plant. The *Canadian Engineer* reports that a contract has been awarded to the R. U. V. Company, of New York, for the installation of thirty-five "Pistol" lamps for the sterilisation of water by means of the ultra-violet rays of the mercury vapour quartz lamp. This is the first municipal installation of the system in America. It is no small plant, the capacity of the filters with which the lamps are to be used being 16,000,000 gallons per day. The lamps will operate in banks of seven, and will be spaced 30 in. apart. Each bank will rest in a concrete channel 2 ft. wide by 3 ft. deep by 26 ft. long, and the water will pass through the channel at a rate that will allow an exposure of 30 seconds to the ultra-violet rays. The cost of the installation will be £4,120. Whether the Niagara Falls water authority intend to omit the whole or part of the present coagulating system is not stated, but it seems possible in view of the fact that filters are to be used, and that at Marommes les Rouen the water is filtered through sand at a rate of 50 ft. in twenty-four hours. Also it is one of the advantages of the system that the degree of treatment can be varied according to the quality of the water by having more or fewer lamps in operation at one time as the case may be. Again, it seems to be an established fact that with the ultra-violet rays treatment a much higher speed of preliminary filtration is possible than would be necessary for the production of potable water. It is essential that the water should be free from all small visible suspended matter, however, and the actual degree of the preliminary treatment required will probably be a matter of trial and error. The working costs of the process at Niagara Falls, and fuller information as to details, are matters for which we should wait with interest.

Main Roads in Middlesex.

The seventh annual report of the Highways Committee of the Middlesex County Council, which includes reports by Mr. H. T. Wakelam, M.Inst.C.E., the county engineer and surveyor, on the main roads and bridges of the county, is of special interest as giving some account of the steps which have been taken to meet modern traffic conditions in an area of peculiar difficulty. In dealing with the state of the main and subsidised roads, Mr. Wakelam emphasises the fact that, prior to the introduction of the motor car, ordinary water-bound macadam road surfaces were generally found sufficient to meet the needs of the traffic then on the roads. With the introduction of mechanical traction on a considerable scale, however, signs of surface deterioration soon made their appearance, and the intolerable dust nuisance arose. Attempts were made at first to meet this nuisance by means of chemical dust layers, but the method of tar-painting ultimately prevailed. For some years in Middlesex an annual application of this material was usually found sufficient to keep a water-bound road in good order. But with the constantly increasing weight of vehicles, and, above all, with the introduction of the fast travelling motor omnibus, it was found that the ordinary water-bound roads were being subjected to a certain process of wholesale destruction. To use Mr. Wakelam's own words, no county in Great Britain has suffered more in this connection than Middlesex. Roads which two or three years ago were of a very high standard are to-day, owing to motor omnibus traffic, little better than the district roads of a poor urban district—despite the amount of money and materials that have been annually expended upon them. The wear and tear by motor omnibuses on water-bound metalling has become so great that it has become absolutely necessary, both from a financial and practical point of view, to discard the use of water-bound granite, and to lay surfacing material of a more permanent character. As an example it may be mentioned that during the year covered by the report now under consideration the whole length of the main Bath road maintained by the county council has been reconstructed with Trinidad asphaltic macadam. Further, a bituminous surfacing has also been commenced along the St. Albans road, and will be continued throughout the whole length of that thoroughfare so far as it is maintainable by the county. With these facts before us, it is not surprising to learn that the cost of the upkeep of both main and subsidised roads in Middlesex is, and is likely to be, on the increase. But when the peculiar conditions of an area situated in such close proximity to the Metropolis are considered, it might reasonably be expected that the council would be treated with exceptional generosity in the matter of Exchequer grants. In the past, however, this has not been the case; but when the scheme of road classification contemplated by the Road Board is brought into operation it is hoped that the county finances may benefit to a very considerable extent.

Highway Administration in Ontario.

The importance of the public highway as a means of communication for any community has become so much enhanced in recent years that the problem of providing good roads has thrust itself to the fore in every part of the world. We have before us the report of the Public Roads and Highways Commission of Ontario which was appointed last year to make a preliminary survey of the question as it affects that province, a volume which, although it naturally deals principally with local conditions, contains much that is of wider interest. The main conditions with which the commissioners were faced are radically different from those which obtain in England, and may be summed up as an enormous area, a sparse population, and monetary resources which, while not meagre, have definite limits. In these circumstances the suggestion that the province should embark upon a definite fifteen years' policy, and establish a form of organisation carefully designed to be simple and flexible, and to fit itself into the development of the future, is undoubtedly a wise one. The general recommendations of the commission are based upon the assumption that the mechanically propelled vehicle has come to stay, and upon a conviction that the successful solution

of the problem of good roads in no small measure depends upon a recognition of this fact. This leads to the general conclusions that the cities must co-operate with the country districts in procuring good roads, and that the problem is inseparable from questions of taxation. As regards administration, the commissioners realise the importance of maintaining as far as possible local control in order that local interest may be kept thoroughly alive. On the other hand, some form of central control is necessary, and they accordingly suggest the establishment of a central road department working in harmony with local authorities, with the idea that upon the latter shall rest the responsibility of producing and maintaining roads necessary for the traffic needs of the people. Regarding the taxation of motor vehicles, the commissioners, in our opinion, take a very sound line in declining to recognise that such a tax should be levied as a punitive measure. Every user of a highway contributes to its destruction, and if any attempt is made to graduate taxation to the amount or mode of user, endless difficulties will arise. It must not be taken, however, that we are opposed to the taxation of such vehicles. In our opinion the automobile may fairly be regarded as a form of wealth which is proper for taxation, and the amount raised may appropriately be used for road improvement. The importance of the work of the commissioners and its influence on the future development and prosperity of Ontario can hardly be exaggerated, and it is to be hoped that the legislature will vigorously pursue a forward policy. There is more than a modicum of truth in the dictum of an American statesman that "you cannot increase the prosperity of a country as a whole without increasing its highway facilities."

* * *

For the Ambitious.

We have before us a copy of the printed form of application sent to candidates for the joint appointments of "Inspector of Nuisances and Surveyor, *cetera*," to the Borough of Okehampton, which was recently advertised. Our attention was first attracted to this appointment by the advertised scale of salary—namely, £50 a year as inspector of nuisances, and £30 as surveyor under the Public Health Acts, inspector of petroleum, &c., the whole to be increased by annual increments of £5 until a maximum of £100 is reached. The borough is, no doubt, a small one, but this is not a relevant consideration, inasmuch as the person appointed must give his whole time to the duties of the office, which include attendance at all the meetings of the council and committees, most of which are held in the evening. The fact remains, therefore, that the council seek to obtain for £80 a year the whole-time service of an officer who, in addition to holding a qualifying certificate as inspector of nuisances, will also have, among a multiplicity of other duties, to "prepare all plans and specifications in connection with works of sewage disposal, markets, street improvement and widening, and water supply, and superintend the carrying out of such works." These duties can only be properly discharged by a professional man with an adequate technical training, and we leave it to the council to ask themselves whether in the circumstances, if they wish to obtain a capable officer, they should not either offer a larger salary, or, if this is impracticable, allow the person appointed to eke out a living wage by means of such private practice as he can obtain. Apart from any question of salary, however, the form of application merits comment in two particulars. In the first place it is stated that the officer "will act under the medical officer of health." This condition is not expressed as being subject to any qualification, and therefore presumably applies not only to the officer in his capacity as inspector of nuisances, but also when he is superintending, say, the carrying out of street works, or preparing plans and specifications for works of water supply. Intending candidates should take note of this *before sending in their applications*; for the second point to be noted is that every applicant has to sign an undertaking to accept office, if elected, and once an application is sent in a candidate may be elected in his absence if the council see fit to do so. We should have thought that the condition that canvassing councillors, either directly or indirectly, will disqualify was superfluous.

* * *

Economy in Watering.

In another column will be found an article from the pen of Mr. Ernest H. Essex, ASSOC.M.INST.C.E., the engineer and surveyor to the Leyton Urban District Council, in which he describes the economies that have been effected in the street watering service of that district since the introduction of the Essex time recorder as an attachment to each van. The whole article affords an excellent illustration of the economies which result from thorough administration, systematic observation of possible sources of waste, and initiative and ingenuity in stopping them when found. The recorder is a simple instrument, and consists essentially of a card which is rotated by clockwork once in a period of twelve hours. Further description would be out of place here, but we may say that the device not only enables the surveyor to satisfy himself that each van has in fact delivered a prearranged number of loads during the day, and that these loads have been full ones, but also renders it possible for him to ascertain at a glance the times occupied in filling the van, travelling with a full load, distributing the water, travelling empty, and meals respectively. An inspection of the actual records on charts, which we reproduce, will show at once the clear and useful nature of the information which they afford. As regards the practical economic value of the recorder, it is sufficient to say that the inventor anticipates that in the district for which he is responsible its general use will result in a saving of about 2d. for every 1,000 gallons of water distributed.

* * *

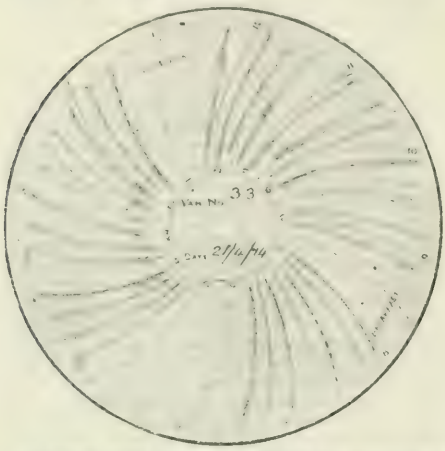
Wiltshire Main Roads.

In our issue of August 21st last we published a letter over the signature "One of the Ten," in which the writer took exception to some remarks which had been made by Mr. Docking, a member of the Wiltshire County Council, in discussing a recommendation that the county council should themselves undertake the maintenance and supervision of the whole of the main roads at present repaired under contract by the rural district councils. In commenting upon this letter we pointed out that we had no desire to criticise the recommendation in question, but that we did complain of the tone of Mr. Docking's speech, which bore the appearance of an attack upon the thirteen district surveyors concerned. Mr. Docking has since written a letter on the subject to the *Wiltshire Times*, which, in fairness to him we print at length in another column. It is satisfactory to observe that Mr. Docking states in terms that he blames neither the surveyors nor the roadmen, but that his attack is directed against what he describes as "the muddle-headed and stupid system which perpetuates and tolerates" the present state of affairs. This admission should result in the removal of any personal element from the discussion. On the question of policy, however, Mr. Docking and "One of the Ten" remain at variance, and we are afraid that we are not in a position at present to judge between them.

The Science of Street Watering.

By ERNEST H. ESSEX, Assoc. M.Inst.C.E., Engineer and Surveyor to the Leyton Urban District Council.

In an address on the subject which I wrote last year I expressed the opinion that each water van (380 gallons capacity) should distribute twenty-four loads per day over 6 miles of roadway watered once = 9,000 gallons to 88,000 super. yds. of carriage way = say, 10 yds. to the gallon. At that time I was getting only seventeen van loads per day, and in consequence advocated the



This chart shows that the carman has distributed thirty loads, no doubt under the wrong impression that the greatest number of loads would obtain him the highest commendation. On inspection of the van it was found that a number of the holes in the box sprinkler had been opened out, some of them to nearly ¼ in. in diameter. The chart shows short loads, particularly at 10.30, 2.40, 3 o'clock and 4 o'clock. It also shows delay in filling at the standposts at 9.35, 10 o'clock, 11 o'clock, 2.30 and 3.40. This delay may have been due to another van using the same post, and could be remedied either by re-organisation or the provision of a new standpost.

insertion of a new clause in the street watering contract to ensure the distribution of the 9,000 gallons required daily. The following table shows the comparison of last year's working under that clause compared with that of the three previous years.

This chart shows that time was lost from 7.40 to 9.15 through the horse casting a shoe and having to be taken to the farrier. The carman made up for this by taking short time in the dinner hour and by pushing on with his job, completing his twenty-four loads and getting back to the yard at 4.25. At 10.25 he had to wait five minutes at the post to fill, no doubt waiting for another van using the same post. At 10.15 he had to travel five minutes to another road to empty, and in the ordinary way this load would probably have been returned as a load on each of the two roads watered.

I am sure, worthy of consideration at the hands of every municipal surveyor. I consider $\frac{1}{50}$ in. depth of water, or 10 super. yds. to the gallon, for each time of watering, the maximum required for granite or ballast water-bound roads on a dry day. The width of the road does not enter into consideration except

STREET WATERING.—TABLE SHOWING COST OF DISTRIBUTION FOR PAST FOUR YEARS.

Season.	Cartage. Rate per day.	Cartage. Cost per annum.	No. of cart days.	Quantity of water used. Gallons.	No. of 380 gals. Van loads.	Average loads per day.	Average gals. per day.	Cost of distributing 1,000 gallons. Total cost.	Saving compared with 1910.	Increase in tender prices.	Supervision under contract.	Actual saving.	Actual saving for the season.
	s. d.	£						d.	d.	d.	d.	d.	£
1910	9 6 9 4 9 6	1,353	2,847	18,349,100	48,288	17	6,450	17·70	—	-	—	—	—
1911	9 7 9 6 9 8	1,070	3,475	24,041,100	63,845	17·5	6,450	17·47	0·13	0·25	—	0·68	6
1912	10 8 10 8 10 6	1,349	2,524	16,445,000	43,278	17·1	6,198	19·20	—	2·15	-	0·35	3
1913	12 3 12 4 12 4	1,287	2,092	18,000,200	47,527	22·8	8,604	17·10	0·60	1·96	2·50	2·56	193

The effect of the new clause was to increase the tender prices for cartage by 1s. 6d. per day for supervision; but even then there was an actual saving in distribution last year compared with 1910 of 2·56d. per 1,000 gallons, or £193 for the season. This year we are attempting also to retrieve the 1s. 6d. per day charged for supervision (equivalent to 2d. per 1,000 gallons distributed) by attaching time recorders to the water vans, and reverting to the old clause in the contract. The charts reproduced herewith will show that adequate supervision is ensured, and that the horses and men will not be overtaxed to discharge the twenty-four loads per day required. This will so far as the total number of gallons required to cover the road in question. I certainly think less than this is sufficient on well-paved roads, but I do not place much reliance upon variations in the jets to be controlled by the carman. The table on p. 325 as to the rate of speed and travel of van will make this clear.

The Warwick sprinkler, a type which has been largely supplied to municipal authorities, is sent out with a variable spread, by which the carman can empty his van in 6, 4½ or 3 minutes respectively, but it will be noticed that to distribute not more than $\frac{1}{50}$ in. with the fine spread he would have to travel 3½ miles per hour, with a medium spread 6¼ miles

per hour, and with the heavy spread at the impossible rate of 9 miles per hour. It is the indiscriminate use of such vans that gives rise to most of the complaints as to excessive watering of carriageways, and if all water vans were fitted with a time recorder the head of a department could see for himself when the men were emptying their vans too quickly. In my district I have altered all my sprinklers to empty in not less than nine minutes, which gives a rate of travel of 2½ miles per hour, corresponding with the old type rectangular vans, and the men are told to travel more slowly if the weather is exceptionally hot. Although the tendency is to travel about 3 miles per hour, I very seldom need to call upon them to reduce speed for the efficient watering of my roads. A high pressure or any form of rotary sprinkler is, of course, capable of adjustment to vary the rate of discharge to suit the rate of travel.

THE ESSEX TIME RECORDER.

The objective of this recorder is to satisfy the municipal surveyor, or other person responsible for the proper watering of town streets and roads, that each van has distributed a certain number of loads per day, that those loads have been full vanloads, and that the time set to travelling to and fro between standposts and roads to be watered has in no case been excessive owing to the unsuitable position of any standpost.

The recorder consists of a card rotated once in twelve hours by a simple clockwork arrangement with a float inside the water van partially rotating a rod on the top of the van, to the end of which is attached a flat spring arm carrying a pencil which records on the cards.

A reproduction of the charts obtained is shown, and the simplicity of the attachment speaks for itself. It is impossible to travel full or empty and produce a thin lateral line on the chart; on the other hand, a thin lateral line is recorded on the chart as soon as the van stops moving. The thick line recorded when emptying is due to the movement of the water in the van when travelling. If the van is emptied while standing, as, to flush a gully or drain, such emptying will be recorded by a thin radial line similar to that produced in filling.

Association of Managers of Sewage Disposal Works. The meeting of this body which it had been arranged to hold at Huddersfield on September 26th has been postponed indefinitely on account of the war.

Devonport's New Motor Fire Engine.—The Corporation of Devonport have recently acquired a powerful new motor fire engine. The engine is petrol driven, of the Merryweather "Hatfield" type. It develops 60-b.h.p., and the pump is capable of delivering 350 gallons a minute. A 45-ft. detachable fire escape is carried, and towing arrangements are provided for drawing a "Gem" pattern horse draught steam fire engine which was supplied by the same makers and has been in service for fourteen years.

Louvain Town Hall.—Photographs of Louvain, after the sacking of the city, have just reached London. While bearing out the reports of the terrible nature of the German outrage, all lovers of the beautiful will be delighted to hear that the famous town hall has almost, if not entirely, escaped injury. It has already been reported that the Germans declared they had spared some of the historic architecture of the town, and one picture showing a group of Germans posed for their portraits in front of the town hall would seem to indicate (says a news agency) that they were specially desirous of emphasising this fact. Otherwise, however, the devastating nature of the German revenge is only too apparent.

EXPERIENCE OF RECENT METHODS OF ROAD CONSTRUCTION IN LIVERPOOL.

By JOHN A. BRODIE, M.INST.C.E.,
City Engineer.

The most marked development in the character of street traffic in the Liverpool district during the past year has been the continued increase in the volume of heavy motor traffic to and from the docks and warehouses and the manufacturing districts of Lancashire.

For this traffic, as well as for ordinary motor traffic, the use of pitch-grouted macadam in the outer areas of the city, as adopted some years ago in Liverpool, has continued to give satisfactory results, and up to the present time is adequate to meet the demand made upon it in marked contrast with the ordinary water-bound macadam roads on heavy traffic lines which have not yet been reconstructed. This statement is to be taken as applying only to roads in the outer districts, where the traffic, although in some cases heavy, is not dense; in the central area, and especially in the immediate neighbourhood of the docks, where the traffic is congested and exceptionally heavy, exceeding, in some cases, 500,000 tons per yard width per annum, no pavement has been found to compare from the point of view of economy with granite setts on a Portland cement concrete foundation.

Description of van	Capacity.	Time emptying.	Discharge per minute.	Width of spread.	Area to be covered by one gallon.	Calculated rate of travel.	Area covered per minute.
	galls.	mins.	galls.	yds.	sq. yds.	m.p.h.	sq. yds.
Ordinary type rectangular fitted with 12 No. 8 Combe's jets	140	9	14	6	10	2½	140
Warwick patent sprinkler	145	6	24	7	10	3½	710
"	—	12	11	6	10	6½	1,1 0
"	—	5	148	2·6	10	9	1,480
"	—	6	50	7	10	2½	500
Electrically propelled van	2,000	12	176	10	10	6	1,760

A depth of water equal to 1·4 in. represents 1 gallon to 10 super. yards.

The area of pitch macadam laid during the past year amounts to about 90,000 sq. yds., bringing the total up to about 450,000 sq. yds. These figures include a considerable area of old boulder-paved streets over which a 3-in. layer of pitch macadam has been laid. Under a large volume of light motor and carriage traffic, amounting to 120,000 tons per yard width per annum, a life of at least twelve years without repair may be expected from pitch macadam; but particulars are not yet available to enable an accurate estimate to be formed as to the probable life of the pavement under heavy motor traffic.

The use of softwood pavement in preference to stone setts in the business and shopping areas of the city, where a silent pavement is desirable, is receiving attention, and during the past year several streets have been so paved with satisfactory results. The Liverpool specifications of pitch macadam and softwood pavement are attached.

SPECIFICATION FOR PITCH MACADAM.

Upon a 10-in. hand-pitched foundation, laid and consolidated in accordance with the fourth-class specification (for water-bound macadam), a layer of dry macadam of 2½-in. gauge stones, similar in quality to that used for water-bound macadam, shall be spread evenly to a depth of about 3½ in. (before consolidation). This layer, after being rolled with a light steam roller, shall be grouted with a hot mixture of pitch and creosote oil prepared in accordance with the specification below, and again rolled while hot until the mass is thoroughly consolidated. A second layer of similar macadam of 1½-in. gauge stones, 3 in. deep, shall then be laid, preferably while the lower layer is still hot. After being rolled dry, it shall be grouted in a similar manner with the pitch mixture, and again rolled until the whole is consolidated. The surface shall be finished off with a sprinkling of dry granite chippings. The road shall be laid to an approximately circular camber, with a crossfall from crown to channel of 1 in 48.

Specification for Pitch Grouting.

The pitch mixture used for grouting shall consist of coal-tar pitch and creosote oil supplied to the specifications given below, and boiled together in a

[illegible] the proportions of, approximately, 70 gallons of coal-tar pitch to 1 ton of pitch, a temperature of from 250 deg. to 300 deg. Fahr. being attained. The proper consistency shall be obtained by applying the following rough tests: A small sample of the mixture, when cooled to about 90 deg. Fahr., shall [illegible] at least 3 ft. without breaking, the threads pulling out very [illegible]. It shall also when dropped into a pail of water [illegible] on a hard surface spread showing any sign of cracking. After leaving the boiler, and immediately before being put on the road, an equal quantity of fine chippings, heated to 100 deg. Fahr., shall be added to the pitch mixture, which shall then be kept continually stirred until spread.

Specifications for Materials

Macadam.—The macadam shall be of hard stone granite or trap rock from the quarries of North Wales, or from other approved quarries having a similar class of rock. It shall be carefully broken into cubical form so as to be capable of passing through the specified gauge in any direction. It shall be cleanly riddled to free it from dust, and all flat slatey fragments shall be picked out before shipment. 2½-in. macadam shall pass through a 2½-in. ring and be held by a 2-in. ring. 1½-in. macadam shall pass through a 1½-in. ring and be held by a 1-in. ring.

Special Coal-tar Pitch.—(1) The pitch shall yield no matter volatile below 270 deg. Cent. when subjected to dry distillation, and its total volatile organic matter shall not fall below 30 per cent. (2) It shall not contain more than 30 per cent of its weight of matter insoluble in petroleum spirit of 0·700 specific gravity (boiling [illegible] and must be free from extraneous matter, such as sand and grit. (3) It must twist fairly after immersion for two minutes in water at 60 deg. Cent., but not under 55 deg. Cent.

Special Creosote Oil.—(1) The oil supplied shall be obtained exclusively by the distillation of coal-tar, and shall not contain any portion of the distillate obtained below 240 deg. Cent. None of it shall redistil below 240 deg. Cent. (2) The oil as obtained by distillation of coal-tar shall not be treated in any way, either by the addition of any coal-tar product, or by the extraction of any of its constituents, excepting such extraction as may be necessary to comply with clause 3. It shall contain no moisture. It shall contain no solid matter at 15 deg., and shall have a specific gravity of not less than 1·075 (taking water as 1·00 at 15 deg. Cent.). It shall contain not less than 40 per cent of its constituents that do not distil over below 320 deg. Cent., and the 60 per cent which does distil over below 320 deg. Cent. shall contain 10 per cent of tar acids, to be extracted by soda of specific gravity 1·125 (water 1·00).

SPECIFICATION FOR WOOD PAVING.

The foundation shall consist of a concrete bed, as in the case of sett-paved streets, but the surface shall be carefully smoothed to the exact contour, which shall be approximately circular in section with a crossfall from crown to channel of 1 in 48. The pavement shall consist of blocks of Baltic, Swedish or Canadian red pine, thoroughly seasoned, sound throughout and free from sap, shakes, waney edges, or large knots. They shall be 9 in. long by 3 in. wide by 5 in. deep, the depth and width to be absolutely accurate. They shall be impregnated with creosote oil of approved quality to the extent of not less than 8 lb. per cub. ft. of timber. They shall be laid on the concrete bed without any intervening layer, in regular straight and properly-bonded courses with close joints. The channels shall be [illegible] longitudinal courses of blocks which shall be hand-dipped (hand and side) in a hot mixture of pitch and creosote oil, and an expansion joint 2 in. wide shall be formed along the kerb and filled with a properly tempered mixture of pitch and creosote oil, or other approved material. The joints of the pavement shall be grouted first with a hot composition of pitch and creosote oil, and afterwards with a grouting of cement and sharp sand, and finally covered off with small pea gravel.

A Glossary of Road Terms. By H. Percy Boulnois, M.INST.C.E. St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, E.C. Price 2s.—Mr. Boulnois has achieved far more than he may imagine by this production of his pen. He set out to standardise the nomenclature of road terms; in addition he had made a valuable addition to English literature. To the untutored it is like reading a new language; Mr. Boulnois says it isn't anything like "complete." At any rate, it is a valuable *vade mecum* which no one has attempted before.—*Portsmouth Times.*

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Has not the Royal Sanitary Institute come to the front, as usual, at the right moment? Could anything be better than the proposal to form four Field Ambulance detachments under the War Department, and are there not a large number of members and associates of this institute who are exactly the right sort of men to enlist in this useful corps? Can we not confidently expect that the 750 men required for this noble work will be speedily forthcoming?

* * *

Is not the example set by the Royal Sanitary Institute worthy of being followed by other institutions and societies in various directions suitable for their members?

* * *

Would it be possible in some way to provide a badge for every man who has sought enlistment, and who, for some reason beyond his control, has been rejected? Would not such a badge protect him from the feeling of shame which every young, able-bodied man in this country must be beginning to feel when he appears in the streets or any other public place? Is it fair to the willing *man* that he should be mistaken for a *waster*?

* * *

How many men and women in this country are there who belong to the A.I.L.L. [All is Lost League]? And would it not be better if they read that most excellent advice in their Bible "Cast out fear," and at once become members of the C.O.F.B. [Cast Out Fear Brigade]?

* * *

Does it not seem difficult to realise that only a year ago the International Road Congress was held in London, and that men who are now engaged in fighting for their lives were amicably discussing technical points concerning roads which were to be used for commercial and civilised purposes? Where will the next International Road Congress in 1916 be held? Will it be held at Munich, as was arranged?

* * *

Can we not heartily say "Well done, Camberwell!" when we read that the council have been obliged to close all their lending libraries owing to the fact that the staffs have volunteered for active service? Can we not also be fully assured that the pockets of these brave and patriotic men will in no way suffer?

* * * *

Is it a fact that His Imperial Majesty the German Emperor is an honorary member of the Institution of Civil Engineers? And if he has not already resigned, will the council take steps at once to remove his name from the list? Are there any ordinary members or associate-members of this institution who are not naturalised English subjects, and still remain members?

* *

Is it not gratifying to find that the Improved Wood Pavement Company, Limited, have resolved that no unmarried workmen who are eligible for service in the Army will be retained in their employment unless they are the main supports of relatives or other dependents? And will not this be the means of allaying a good deal of talk one hears of the employment in the public streets of men who, from their appearance, might be serving their country to better purpose?

* * *

Who could read the magnificently stirring address by the Prime Minister at the Mansion House without being deeply moved and impressed with the righteousness of our war with Germany? Will it not stir the heart of everyone calling himself a Britisher, and make him long to be "up and doing" for the defence of his country?

* * *

Is not the courageous action of Mr. Charrington, in protesting against football matches being played while so many of our brave countrymen are laying down their lives in playing *the* game in France, to be highly praised? Is it not almost inconceivable that thousands of young, able-bodied men should be idly watching a football game when their only thoughts should be: What can I do to defend my country?

Modern Methods of Road Construction and Maintenance.

WHAT MUNICIPAL ENGINEERS ARE DOING (2).

In response to a request made a short time ago we have been favoured with a large number of communications from readers embodying the results of their experience with the methods of road construction which it has been necessary in recent years to introduce into their districts in consequence of changes in the character of the traffic. A first instalment of these appeared last week, and a second is given herewith.

ALTON, HANTS.

Mr. G. BERTRAM HARTLEY, F.S.I., Surveyor.

Tarmac, very satisfactory. Smith's tar-macadam, very satisfactory, three coat work best for wide roads, mixed graded material with fine toppings preferable for narrow roads. Rocmac, satisfactory, more especially where trees overhang roads, or on steep gradients. Basalt, tarred previous to laying, or on Tarvia sub-binder, results but fair. Limestone, under similar conditions, very satisfactory. Clee Hill basalt, water-bound and tarred surface or on Rocmac binder, very satisfactory. Surface treatment: Distilled and crude tar, satisfactory; petroleum asphalts, poor results. Local materials: Flints, tarred previously to spreading, or surface tarred after, good results. Bargate rock, surface tarred, good results. gravel, surface tarred, indifferent results.

BRISTOL.

Mr. LESSEL S. MCKENZIE, ASSOC.M.INST.C.E., City Engineer.

In the heart of the city of Bristol practically all the roads are paved with wood, Australian and creosoted deal, the latter gradually taking the place of the hard wood. In the neighbourhood of the quays granite setts on concrete are mostly used.

The greater proportion of the macadam roads are coated with an excellent limestone obtained locally, and known as Blackrock. The stone being water-bound, and after being worn thoroughly hard, a coat of hot tar is applied, and for all the side roads and the roads in the residential parts this is found to be a very cheap and serviceable road, the limestone taking the tar exceedingly well and only requiring treatment every other year.

For main through roads, however, and roads along which motor 'buses travel, this construction is not good enough, and various other methods have been tried during the last four or five years. Sections of Tarmac, Pitchmac, Tarvia, granite or limestone grouted with Val de Travers asphalt, Roadoleum, Glutrin, Rocmac, and Vianex have been laid. The Tarmac stands very well, but as slag cannot be obtained in the district its use has not been extended. The Pitchmac has also stood well, but becomes very soft in the hot weather and very hard and rather inclined to be slippery in the cold weather. The Rocmac also seems to be an excellent binder, but the surface requires tarring to keep down the dust. Carpets of 1 in. thickness of Roadamant and Cormastic have been laid on the surface of a macadam road subject to motor 'bus traffic, and the former is standing the traffic the better. Carpets of Mexphalte 1 in. thick have also been laid on the surface of macadam roads. In one case a carpet formed of ¾-in. crushed granite, sand, Mexphalte and cement was laid in a road which carried the bulk of the heavy traffic to the Royal Show last year, and it stood it splendidly. Since then a section has been laid adjoining; in this no granite was used—simply sand, Mexphalte and cement. Sections also of 3-in. Mexphalte construction (in which the aggregate used was the local blackrock stone broken to a 1-in. gauge and under) have been laid on old road foundations, and in one case on a concrete foundation in place of wood paving, and these are all, so far, in very good condition, the only apparent defect being the inclination to slight waviness in the surface.

The boldest experiment carried out with this material is in Prince-street, a road adjoining the quays, along which very heavy traffic passes. This street was paved about ten years ago with granite setts on a concrete foundation, but the setts turned out weak and the surface became very uneven, though the concrete remained good. The area is about 4,000 yds. super., and to repave this out of revenue would have been a serious expenditure. The Highways Construction Company entered into a contract to lay a bottom coat of Mexphalte formed with ¾-in. local blackrock stone, 3 in. thick in the centre and running out to nothing at the channels, and then lay a 1-in. carpet over the whole, formed of Mexphalte, sand and cement, at 5s. per yard, with three years' guarantee. The work was carried out last September, and so far it is as good as the day it was laid, and looks like lasting many years. A good many cobble-paved streets have also been covered with a 1-in. carpet of Mexphalte, as being the cheapest method of dealing with them. This material is, of course, on its trial, but so far it appears to be sound, and if successful the corporation will put up a plant and carry out the work themselves.

A considerable quantity of tar-macadam has been laid by the corporation, but this has not really been a success on heavy traffic roads.

"Kleinpflaster" formed of 4-in. granite blocks, laid fan pattern, has been tried in connection with macadamised roads bearing heavy traffic. The blocks are laid by hand on the old macadam on a cushion of gravel or cement concrete and grouted with similar material. This method has been marked with great success. "Durax" has also been tried, but quite recently. This system has been laid in a street subject to very heavy traffic, and very good results are anticipated.

DUFFTOWN.

Mr. H. M'KAY, Burgh Surveyor.

Our roads within the burgh are ordinary macadam, with the exception of a part laid with Rocmac last year. Not only is the surface much cleaner than the ordinary macadam, but there is every indication that the life of the road will be very much longer.

GILLINGHAM.

Mr. J. L. REDFERN, Borough Surveyor.

For some years now it has been the practice to tar-paint the whole of the roads in the borough of Gillingham with dehydrated tar. This has extended the life of the roads, reduced the cost of scavenging and watering, and the annual cost of maintenance has not risen in spite of the growth of the town. Busy streets are treated every year; those with little traffic every other year. During last year 383,000 sq. yds. of roads were treated, at a cost just under 1d. per square yard, everything included.

Tar-macadam is used considerably, and has given excellent results. Durax paving has been laid between tramway margins and channels, and has worn well. A small quantity of pitch-grouting has been tried experimentally.

The Gillingham Council have purchased a new 10-h.p. four-seater four-cylinder Humber car for the use of the borough surveyor to replace one of another make which was purchased in November, 1906. The new car has cost £250, a credit of £30 being allowed for the old car.

The town council have adopted a forty-eight-hour working week for their workmen.

HAWICK.

Mr. CHARLES BROWN, Burgh Surveyor.

The main streets in our burgh from the Railway Bridge to the Tower Knowe, in all 10,000 sup. yds., was resurfaced with a bituminous covering 1½ in. thick (Bitromat), the contractors being Messrs. W. & G. Walker, Edinburgh. The work was completed in August of last year, and it has certainly improved the look of the town, which formerly was partly laid with whinstone paving and water-bound macadam.

The contract provides for the contractor keeping up the road for a period of ten years.

HELENSBURGH.

Mr. JAS. N. STIRLING, B.SC., ASSOC.M.INST.C.E., Burgh Surveyor.

Up to the year 1909 the streets of this burgh—extending to about 22 miles—were made entirely with

[illegible] The stone used was generally whinstone and granite from quarries within a 35 miles radius of the town. In 1907 the then surveyor, Mr. Lewis Watkins, recommended the adoption of some more enduring material, and after some experiments the Rocmac mixture was adopted as the standard road for the town.

Where the surface was good and hard Rocmac was used, and limestone dust binding the mixed together and rolled up from the bottom through 2½-in. [illegible] Where the road surface is not good the Rocmac solution and limestone are mixed with the metal as if for concrete, and the road rolled.

In this district the cost works out at from 6d. to 8d. per square yard more than for an ordinary water-bound macadam road. These figures apply to coatings of metal from 3 in. to 4½ in. thick, and the life [illegible] than that of an ordinary water-bound macadam road.

The Rocmac roads here have proved very free from mud, and in this wet climate that is of inestimable benefit; and when the Rocmac road which has been [illegible] to have as sharp edges as when they were laid, showing that there is very little internal wear. On the other hand, there is some trouble from dust in the summer time, although the dust is never anything like so bad as with an ordinary water-bound road, and a good deal of trouble has been experienced from the appearance of potholes over the surfaces. An effort is to be made to get over the difficulty of the dust by spraying the surface with bitumen after the road has been down for some months; and a considerable saving in the number of potholes can be effected by patching the first few to appear, as after a time there does not seem to be just the same tendency for the potholes to appear.

HORSHAM.

Mr. R. Renwick, Surveyor.

During the past few years the following changes in our methods of road construction have been necessitated owing to the advent of motor traffic and mechanical traction.

The principal streets in the centre of the town have had their former hard stone surfaces replaced by tarred macadam, and other roads subject to through traffic, where formerly coated with flints are now metalled with hard stone, painted with refined coal-tar and dusted with clean granite chippings.

Flints are now only used on streets where the traffic is light and of a purely local nature, and here, again, tar-painting is resorted to with beneficial results, the wear of the surfaces being much reduced by this treatment, and also, and as a consequence, the nuisance from dust. Flint roads when tar-painted are dusted with a gravel in place of granite chippings, thus reducing the cost of the work considerably.

KINGSTON-UPON-THAMES.

Mr. R. Hampton Clucas, Borough Surveyor.

Owing to the changes in the character of traffic, Kingston-upon-Thames Corporation have been obliged to alter the method of construction of the principal roads. In place of water-bound macadam, wood paving (Swedish yellow deal), with concrete foundations, has been substituted in the following roads—viz., London-road, Eden-street, High-street, Portsmouth-road (part of), Surbiton-road, Richmond-road, Thames-street, Church-street and the Market-place, the cost of the work amounting to £18,000. The Local Government Board period sanctioned for the loan was ten years for wood blocks and twenty years for foundations.

Other methods of construction have been adopted on the Portsmouth-road, Surbiton-road and Eden-street—viz., Roadamant, 1 in. in thickness, on the existing water-bound road, the cost including alterations to gradients, &c., being £2,400. A portion of the Surbiton-road has been laid with Cormastic, 1 in. thick, on a water-bound road, at a cost of £300. Many lengths of roads have been constructed with granite and grouted with Plascom; one part of Eden-street has been laid over six years grouted with Plascom, which is subject to heavy traffic. Several lengths of roads have been constructed with tarred slag.

The majority of the above work has been laid two years, and in each case have given satisfactory results.

LURGAN.

Mr. Henry Shillington, M.A., M.E., Town Surveyor.

In this district we have had practically no experience of any of the latter-day methods of road rolling and maintenance other than the ordinary rolled, water-bound roadway. Therefore, having nothing new to tell, I shall, I think, be best advised to give briefly what my experience has suggested as most useful in laying the water-bound road by rolling.

I think most engineers are agreed that with a properly surfaced road it is a mistake to give too much camber—in short, more than will effectively direct surface water from the centre to the sides. But what constitutes "a properly surfaced road"? I believe it is a mere truism to say that we have yet to meet with a road surface that will content all users. Provide a smoothly tar-surfaced or asphalted road that would be the delight of the motorist to carry a traffic of heavily laden wagons, especially on a gradient of, say, 1 in 25, and what a protest would come from the equine control! I remember hearing the borough engineer of a large Black Country municipality say that the horses there generally objected to a gradient of more steepness than 1 in 50 on a tarred surface. I have of course seen, even on water-bound gradients, horses under light carriage traffic slip during the continuance of a long season of hot summer weather where the gradient was, say, 1 in 23, and these horses were fairly smoothly shod.

But it seems to me that one point that has been much neglected, even in ordinary road rolling, is the endeavour to suit the weight of the roller to the class of stone used. Does it not stand to reason that if a limestone metal coating—especially of the softer variety—is considered to require a 10-ton roller, a surfacing of greenstone or any of the very hard hornblende rocks should be given a much heavier pressure? In this district we have for metal basalt rock of the hardest type; our roller is about 12 tons weight, and as a consequence it is unable to consolidate the 2-in. metal we use, except by frequent passage backward and forward—also requiring the use of much more road scrapings to give anything like a smooth surface, and thus leaving each individual stone more subject to the impact of the roller and to consequent injury. If, however, we had a 20-ton roller, we could use, for blinding, the finer stone crushings, and then, with only a few roller passages, leave a roadway smooth enough for motor use, and yet affording a sufficient foothold for heavily laden dray horses.

I should say that, with a roadway such as I have described, a camber of about ¼ in. per foot, formed by rolling in the metalling from the sides towards the centre, should leave a roadway well suited for general use.

I have said nothing about scarifying, which I believe to be required for efficient road repair; but I think that the ideal scarifier has yet to be evolved, and that even where a machine is in use, hand scarifying would still be necessary, even as, at times, some hand-broken metal is found a useful cover to the less-expensive machine-broken metal. The great objection to the machine scarifying is the strain on the roller engine, especially in the lighter engines.

In conclusion, I would say that I think too much attention cannot be given to detecting and repairing the small potholes as they occur, "darning" them in with light metal by the use of the pick, and blinding with cinders—not stone crushings.

SHERINGHAM.

Mr. F. Hall Smith, M.I.M. and C.E., F.S.I., M.R.San.I., Engineer and Surveyor.

My council are converting all our roads and streets from flint to tar-macadam roadways, which, in my opinion, is absolutely necessary in these days of motor traffic.

When the road requires repair, I scarify the old surface, level, and run the roller over to partially consolidate, and spread the tar-macadam, 2-in. metal, about 1½ in. to 2 in. thicknesses. This is rolled down to finished surface, when I fill the interstices with local gravel, with all stones screened out, and roll again, and brush the gravel well in. I then tar-paint, and again cover with gravel, and this makes a splendid surface at a cost of 1s. 3d. per yard super. My roads are equal to any I have seen in towns, and only require repainting every three years.

STROOD (RURAL).

Mr. L. Randerson, District Surveyor.

We have 120 miles of highway, and 20 miles of these are maintained with tar-macadam or other bituminous binder as follows:—

Tarred Kentish Ragstone.—Many sections; has not withstood engine traffic very well, but most suitable for ordinary light motor and traffic roads. The best sections are of hand-broken material. Am of opinion

that better results would be obtained if better quality tar was used.

Quartzite.—Fine material but dead wet. Section laid three years ago, now with signs of wear, and has had considerable heavy traffic to bear.

Tarlithic.—Short sections laid. Would appear suitable for light traffic roads.

Tarred Granite (Guernsey granite mixed with Tarvia [illegible]. Several sections laid, some been down [illegible] are good to-day, and carry heavy motor and engine traffic. Estimate several more years' wear from it.

Tarvia-ted Binder Macadam (double binder).—Section laid four years ago is in splendid condition; section laid three years ago on same road and adjacent not so good. Will require repairs next year. Welsh stone used in first case and blue Scotch in second.

Stone Material (single binder).—One section laid three years ago in good condition. Guernsey granite. [illegible] Section laid three years ago. Present condition fairly good. Bears fairly heavy traffic. Is laid under trees, and on a slight slope of about 1 in 20.

Tar-painting.—The full 20 miles are tar-painted each year. The best results are obtained where the drainage and foundations are good.

I am this year laying down several sections of [illegible] road using Welsh granite and St. Keverne. The council have decided to stop the use of flints and ragstone on about 50 miles of roads (where flints are not produced in the particular locality), and use granite.

WELLINGTON, SALOP (URBAN).

Mr. GEO. RILEY, Engineer and Surveyor.

Wellington being a small district of 700 acres, with a population of 8,000, and only 10 miles of main and other roads, I have laid myself out for tar-painting the whole of the road surfaces, amounting to 93,000 sq. yds., once yearly. I have had erected brick tar vats capable of holding 100 tons of tar, sub-divided into seven compartments, each compartment being heated separately by means of live steam being blown into the vats. The surface of the roads being well swept and thoroughly freed from dust, the tar is carted on to the roads at boiling point, and laid on the surface by means of rubber squeegees, and thoroughly brushed into the interstices with ordinary bass brooms. After the tar is set, a small quantity of sand is sprinkled over the surface. Six workmen sweep and tar-paint from 7,500 to 10,000 sq. yds. per day of ten hours. I find for the year 1913 1 gallon of tar covered 5¼ sq. yds., and one load of clean pit sand 588 sq. yds., the details of cost per square yard being as follows: Crude tar, at 37s. 6d. per ton, ·428d.; sand, at 1s. 3d. per load, ·0305d.; labour, at 3s. 4d. per day, ·1041 [illegible], at 7s. 6d. per day, ·028d.; total, ·59d. per square yard. I may say that to-day, after a winter's wear, the road surfaces have a tar-macadam-like surface, and are in every way highly satisfactory.

(To be continued.)

PRO PATRIA.

In THE SURVEYOR of August 21st, in the column of "Things One Would Like to Know," it was asked if it would not be possible to compile an "Honours" list of municipal, engineering and sanitary officials who are taking an active part in the great war. With a view to carrying out the suggestion we publish below such information as has come to hand, and should be obliged if readers would assist us by notifying us of other cases within their knowledge:—

Ashurst, J., city surveyor, St. Albans.

Ayre, C. A., third assistant engineer to the Watford Urban District Council, has received notice to hold himself in readiness for the Special Reserve.

Barker, E. A., electrical engineer, Barnsley Corporation.

Bell, Leonard, [illegible] inspector, Westhampnett Rural District Council, Lieutenant and Transport Officer attached to the Eastern Mounted Brigade of Field Ambulance (Territorials).

Bennett, R. J., clerk to the borough engineer and surveyor of West Bromwich (Mr. Albert D. Greatorex, M.INST.C.E.), 5th South Staffs Territorials, Infantry Battalion.

Blake, Leslie, assistant surveyor to the Wincanton Rural District Council.

Carter, A. V., surveyor to the Droxford (Hants) Rural District Council, with the 9th (T.) Cyclist Battalion of the Hampshire Regiment.

Edwards, E. W., surveyor to the Blaenavon Urban District Council.

Foster, J. E., temporary assistant surveyor to the East Grinstead Rural District Council.

Garrett, H. A., borough surveyor of Torquay, Captain of Territorial Engineers.

Gladwell, C. W., assistant surveyor to the Eton Rural District Council, attached to South Midland Brigade Army Service Corps. Mr. Gladwell has volunteered for foreign service.

Hooley, E. P., M.INST.C.E., county surveyor of Nottinghamshire, with the 8th Battalion of the Sherwood Foresters.

Hunter, H., sanitary inspector to the Maldens and Coombe Urban District Council, Surrey, attached to Royal Army Medical Corps.

Jenner, A. J., inspector to the Battle Rural District Council, has volunteered for the front with the Yeomanry.

Johns, Percy, borough surveyor of Maidenhead.

Laban, O. G., surveyor to the Leake Rural District Council, has joined the Army.

Lane, W. G., borough surveyor and sanitary inspector of Ludlow, Captain, Ludlow Territorials.

Middleton, ——, inspector of nuisances to the Charlton Kings Urban District Council.

Overfield, H. Y., pupil of the borough engineer and surveyor of West Bromwich (Mr. Albert D. Greatorex, M.INST.C.E.), in the 5th Staffs Battery R.F.A., 3rd North Midland Brigade Territorials at Luton. The brigade has volunteered for active service.

Payne, ——, working manager at the East Grinstead Rural District Council's sewage farm.

Russell, J. W., third assistant to the borough engineer and surveyor of West Bromwich (Mr. Albert D. Greatorex, M.INST.C.E.), has joined the 5th South Staffs Territorials, Infantry Battalion.

Shaw, David Honeyman, assistant district master of works, Dunfermline District, Fife County Council, sergeant, Highland (Fife) Royal Garrison Artillery (Territorials). Volunteered for foreign service.

Smale, W. L. B., surveyor for the Northern District under the Liskeard Rural District Council, 4th Battalion of the Devon Regiment.

Stanton, S. G., second assistant to the borough engineer and surveyor of West Bromwich (Mr. Albert D. Greatorex, M.INST.C.E.), serving in the Motor Cyclist Corps, general headquarters, active service.

Tebbitt, H. S., surveyor and inspector to the Tutbury (Staffs) Rural District Council, field surveyor to the Burton Squadron, North Midland Command, Legion of Frontiersmen.

Tuffin, A. E., on the staff of the surveyor to the Teddington Urban District Council (Mr. M. Hainsworth).

Watts, T. N. W., surveyor and inspector to the Marlow Urban District Council.

Wright, J. R., assistant to the surveyor to the Redcar Urban District Council (Mr. J. Howcroft). Enlisted in the Royal Engineers.

In addition to the "Honours" list of municipal engineering and sanitary officials who are taking part in the great war, we think it will interest our readers if we also publish the names of those in the commercial world who are giving their services, and we have great pleasure in recording the following names of the "commercique" list:—

Beadle, Herbert, managing director of British Macadams Company and Road Maintenance Company, Limited, second lieutenant in the 4th Home Counties Howitzer Brigade.

Cooper, H. L., director of Cooper, Wettern & Co. and H. L. Cooper & Co., Limited, colonel commanding Transport Column A.S.C., Wessex Division.

We understand that both these gentlemen, who are well known to municipal and county engineers, have volunteered for foreign service. There are, doubtless, many other names which could be added to this list, and we shall be grateful for any assistance that can be rendered us in making it complete.

Housing in Rural Districts.*

By ERNEST HOLLOWAY, Surveyor to the Evesham and Pebworth Rural District Councils.

Many rural districts are faced with a housing problem, and the writer is among those who are compelled to consider the closing of many houses [illegible] owing to the growth of the market gardening industry in the locality. The problem was faced in 1912 by first building sixty cottages in the parish of Broadway, then followed twenty-six at Offenham and ten at Pebworth (Glos), and there are schemes in hand for a further seventy-two cottages in various parts of the districts.

At first it was possible to erect cottages to let at a rent not exceeding a total of 3s. 6d. per week, but this had to be abandoned, as to build substantial cottages meant that at these rentals there would be a charge on the rates of the various parishes. It will probably be agreed that it is impossible to build a three-bedroomed cottage in the average rural district at a lower figure than £150—that is, if the erection is to be there at the expiration of sixty years, which is the period of the loan on buildings.

It has been possible to erect them at this figure; in fact, the cost has worked out a little lower where the cottages have been built in blocks of four and six. Experience shows that the cost per cottage on a small scheme, say, of ten cottages has been very little more than where several times that number have been erected.

In this district it is not necessary to build cavity walls, and where good hard bricks have been obtained rough-casting can also be dispensed with.

One or two of the villages where schemes have been carried out are sewered, and have efficient outfall works, and in these cases the drains have been connected direct thereto. Where there are no such sewers cess-pools have been provided. Without exception there has been a supply of tap water for every cottage, this being obtained from the waterworks in the Cotswold Hills, the scheme being one of gravitation to fifteen villages.

The type of cottage the council have decided on is one having a large living-room, with range and fitted dresser, a small scullery, with bath, copper, sink, and small cooking-stove, and a larder, coals, and store under the stairs, all under the main roof, and also, where possible, a water-closet, otherwise an earth-closet 12 ft. away from the house. On the first floor there are three bedrooms, two of which have fireplaces.

The construction of the cottages is as follows:—

Outside and party walls are of 9-in. brickwork, internal walls on ground floor 4½ in., and on the first floor 2-in. concrete partition slabs are used. The roofs are tiled, and have a pitch of 45 deg. In one case rough-cast has been used for the exterior walls. The floors of the living-room are 6-in. square tiles laid on 4-in. cement concrete, and in the scullery and other offices on the ground floor granolithic floors have been laid; upstairs, 1-in. best white flooring with shot edges is used, the timber being red deal throughout; the plastering on the ceilings is three-coat work, and on the walls two coats. In every instance casement windows are put in, and ample provision is made both for light and ventilation. The height of all rooms is 9 ft. throughout. A cheap way of supplying the bath with hot water is to raise the height of the copper to a few inches, and insert a bib-tap direct into it, carrying it over the bath; this, of course, can only be done where the bath adjoins the copper.

Land has cost an average of about £100 per acre, and with one exception road making, sewering, &c., have been avoided. The Broadway scheme of sixty cottages is on 20 acres of ground. There were six pairs, six blocks of four, and four blocks of six, and the average cost per cottage for the building itself was £154. The rents vary in this scheme from 3s. 6d. per week to 4s. 6d., the council paying all rates, taxes, &c. The Offenham scheme has twenty-six cottages on 17 acres of land, ten being on 2 acres and the remaining sixteen on 15 acres, and the average cost per cottage was £155. The rents for these are 3s. 6d., 3s. 9d., and 4s. 3d., and in the latter case the tenants pay an extra 2s. 6d. per week for the acre of land. The Pebworth scheme is ten cottages in two blocks, and there are 2 acres of land; the cost was £146 each cottage, and the rents are 3s. 6d. and 3s. 9d. per week. The Littleton scheme is one of twenty-four cottages built in blocks of four, with a quarter to a third of an acre to each cottage, the rents in this case being 4s. and 4s. 8d. per week inclusive. The Harvington scheme has sixteen cottages on 8 acres of land, six of them having an acre each. The other schemes vary, plenty of land being given where it is likely to be profitable.

The loans obtained have been eighty years for the land, which means an annual payment of £3·7385 per cent for interest and repayment of loan, sixty years for buildings, which is £4·0089 per cent, thirty years for roads, £7·0361 per cent.

Before deciding to carry out any scheme the council consider the records made under the Housing Acts as to inspection of cottages; a local inquiry is then held by the council in the parish concerned, and from the evidence obtained a report is prepared as to the number of cottages required. A site is fixed upon, a deposit paid, and instructions given as to the preparation of the plans, which are sent to the Local Government Board, together with an application for the necessary loans. The Government inquiry into the scheme and for the purchase of the land is held at one and the same time. Every care is taken in the matters of the site, both as regards its position, aspect, &c., and as to drainage.

The councils have, on the whole, been very fairly treated by the landowners, and in only one case was compulsory purchase considered.

A balance-sheet of one scheme is appended, from which it will be seen that this is self-supporting, after making every allowance for contingencies. In the other schemes the same result has been obtained, as the councils stipulate that there shall be no charge upon the rates. The rents fixed can be obtained, as the market garden labourer is better paid than the average agricultural labourer. There has been no difficulty in letting these cottages; in fact, the demand has exceeded the supply.

There have of late been many attempts to prove that a suitable cottage can be erected for about £100. These attempts as a rule take one or other of the following forms:—

(1) The substitution of wood or concrete for brick or stone as the chief material in construction.

(2) The cutting down of the sizes of rooms.

(3) The elimination of all expenditure devoted to giving a pleasing appearance to the cottages.

It will be agreed that all of these conditions are

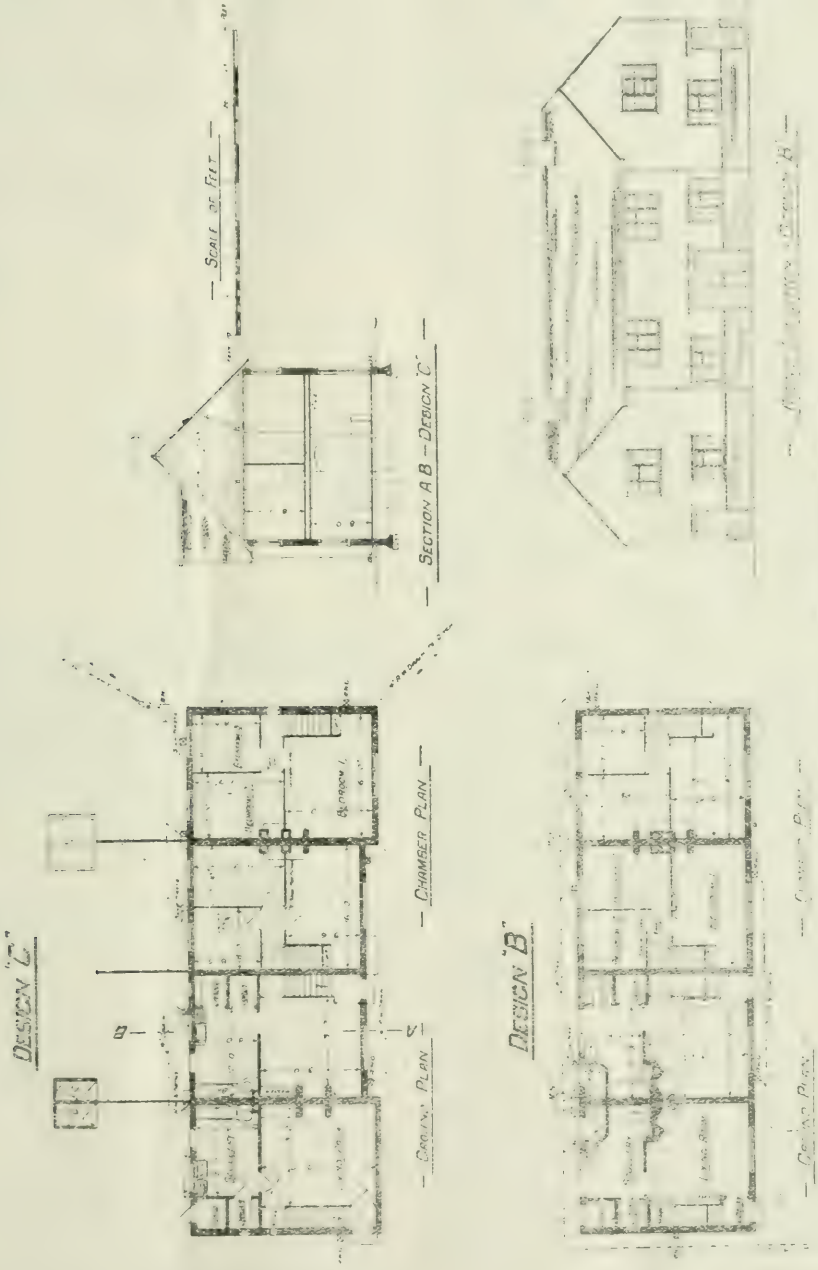
* Paper read at the Annual General Meeting and Conference of the Institution of Municipal and County Engineers at Cheltenham.

most undesirable, and that to carry out the by-laws and in every way to build a substantial cottage should be the effort of a public body.

The materials of construction should be such as to last the full period of the loans without undue expenditure upon repairs. The cottage should be rain-proof, damp-proof, and in every way sanitary, and

desirable that the most flexible by-laws should be in force, or the cost of the buildings, &c., will be very materially increased. The "Model" rural series are in force in these districts, and the only alterations necessary were in respect of the width of carriage-ways, and in the trapping of drains in each curtilage.

Three pictures of the cottages accompany these notes.



the outer walls should be of such materials that there will be no sweating on the inside. The rooms should be of adequate size and well lighted and ventilated. The cottages should be constructed and grouped with a view to pleasing aspect.

When considering a housing scheme the question of by-laws should not be overlooked, and it is highly

A short discussion followed the presentation of Mr. Holloway's paper at the Cheltenham meeting.

Mr. G. BERTRAM HARTFREE (Alton) said he agreed with Mr. Holloway that cottages should be let at rents that would make them self-supporting. If the wages in a district were too small to allow the tenants to pay the rents demanded, surely it was a matter

[illegible] higher rates, not lower rents. They must not [illegible] or the low-paid man, it was simply a State subsidy for sweated labour. Mr. Holloway [illegible] in his plan, and he would like to [illegible] rural areas. He (the speaker) found them not altogether a success unless the author[illegible] the work of emptying for the tenants [illegible] the owners would not do the work. He had tried and met very successful in some spots [illegible] making use of pails and emptying the contents on to gardens. There might be some objection to that [illegible] Where it could be arranged he had found the filtration gutter of Dr. Poore very satisfactory.

He congratulated Mr. Holloway on erecting cottages [illegible] He (the speaker) had got to as low a figure as £148, but he should like to ask Mr. Holloway whether he thought it in every way desirable to adopt tiled floors for living-rooms. They were inclined to be damp, and had a tendency to make the room cold. His first experience was with wood blocks, but he was now making use of Portland cement concrete. Mr. Holloway had referred to the £100 cottages. He (the [illegible] had had an opportunity of seeing the two [illegible] been erected, but the cheaper of the two did not cost £100, but £118, and it was certainly not designed to meet the needs of some Hampshire agricultural labourers, among whom a family of a dozen children was a common thing. He should like to know the wages paid in the different trades in the author's district, the price of bricks on the works, the approximate price of timber, and his price per cube foot for the whole work. He had tried to arrive at the figure of 4½d., but the nearest he had been able to approach that was 4⅝d. per cube foot.

Mr. A. J. REDFERN (Honiton) said he had as strong an objection as anyone to letting houses at a rent that did not provide an adequate return. At the same time they had to consider the health of the people, and the conditions under which they existed at the present time. He noticed that 2-in. concrete partition slabs were used in the bedrooms of the houses described in the paper. Did that thickness provide sufficient rigidity, and what provision was made for shrinkage and vibration caused on the floors? He saw the land had cost £100 per acre, and he should like to know whether that was a fair price for the ground. He was anxious to come across an authority who had exercised its power under the Act to get land at its real value. It would help them considerably in their difficulties if they could buy land at its ordinary agricultural value. He noticed that a considerable quantity of land was attached to the cottages, but his experience was that, even in the country districts, it was not wise to give a great deal of ground. A sixth of an acre was about the average size of garden the ordinary labouring man would work; therefore he suggested that in housing schemes it was better to provide that quantity or only an eighth of an acre, reserving, however, a quantity of land at the rear of the dwellings, so that those who wanted it could have the use of additional ground at a slightly increased rent. In conclusion, he asked whether the charge for the houses was on the parish in which they were erected, or on the whole district.

Mr. F. HARRIS (Tunbridge Wells) congratulated Mr. Holloway on his planning; at the same time he did not altogether approve of the awards that had been made in the premium scheme. He did not think the bath was necessary.

Mr. HOLLOWAY, in reply, said his paper referred to seven schemes, and in only one did he show a cesspool. In the case where he provided a cesspool they had a gravelly subsoil. Tiled floors were more popular than wood. As to wages, labourers were paid 4½d., bricklayers 8d., and carpenters and joiners 8½d. per hour. Bricks were 32s. 6d. per 1,000 at the station, and the whole worked out at 4⅝d. per cube foot. The price of land at £100 per acre was quite reasonable, as it was let at from £4 to £7 per acre. There had been only one case of compulsory purchase of land in England up to the present, and the award, he believed, was something like thirty years' purchase. Any rate charges would be on the parish.

Horseshoe Pillars.—A recent issue of *Country Life* contains an interesting photographic view of two pillars which have been cleverly built of thousands of horseshoes by a blacksmith on the London road between Fairford and Lechlade, Gloucestershire.

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain.
Each man's opinion freely is his own
Concerning anything, or anybody.

—MASSINGER: "The Fatal Dowry," Act II., 2.

NATIONAL RELIEF FUND.

To the Editor of THE SURVEYOR.

SIR,—It may be of interest to municipal officials to know what is proposed to be done in the way of voluntary contributions towards the above fund by the members of the various staffs of the Stoke-on-Trent Corporation.

A meeting representative of the whole of the officials of all departments was recently held, and a scale was discussed and a unanimous decision arrived at, that everyone in receipt of a salary should contribute to the fund.

At the same time it was thought that those in receipt of the higher salaries should contribute a larger proportion than those in receipt of smaller ones.

Consequently a scale was drawn up, of which the following is a copy:

	Weekly contributions
	s. d.
Persons whose salaries are under 10s. per week	1
10s. per week and under 20s. per week	3
20s. " " 30s. "	6
30s. " " 40s. "	9
40s. " " 50s. "	1 0
50s. " " 60s. "	1 3
60s. " " 70s "	1 6
	Per cent
70s. " " £200 per annum	2½
£200 per annum and under £250 per annum	2¾
£250 " £300 "	3
£300 " " £350 "	3¼
£350 " " £400 "	3½
£400 " " £450 "	3¾
£450 " " £500 "	4
£500 " " £550 "	4¼
£550 " " £600 "	4½
£600 " " £650 "	4¾
£650 " " £700 "	5
£700 " " £750 "	5¼
£750 " " £800 "	5½
£800 " " £900 "	5¾
£900 " " £1,000 "	6¼
£1,000 " and over	7½

The contributions are either being collected monthly by a representative in each department, or an order is signed authorising the borough treasurer to deduct it from the usual monthly salary cheques.

In this way it is expected that a very considerable contribution will be handed over to the fund each month for so long as the necessity therefor arises.

I may also state that practically every workman in the employment of the corporation in receipt of over £1 per week has voluntarily promised to contribute 6d. per week to the fund.—Yours, &c.,

A. BURTON,
Borough Surveyor.

Stoke-on-Trent.
September 7, 1914.

[Mr. Burton forwards with his letter a print showing how the scale of contributions works out in diagrammatic form, but as the reproduction of this presents certain difficulties, we are obliged to omit it.—ED. SURVEYOR.]

SANITATION OF A HEALTH AND PLEASURE RESORT.

To the Editor of THE SURVEYOR.

SIR,—There is no doubt that the work of the Blackpool sanitary inspectors is very arduous and most thorough from the description given in your issue of August 28th. There is one portion of the report, however, which is uniform with the majority of reports in this country. I refer to the treatment when damp-proof courses are missing.

The report states that damp-proof courses are fixed in the walls where there is any sign of dampness. I do not know the procedure at Blackpool, but the usual method of providing a dampcourse is to cut out one course of bricks or stone, and then to insert sheet lead or blue bricks (sometimes slate) bedded in cement. This is a very slow process, but until the advent of the system I am about to speak of, there was no other method. If the brick or stone walls were very hard, and even when soft bricks were encountered, a man could not proceed very quickly in such an awkward position close to the ground, and the making good took just as long as the cutting out.

The new system is to treat the interior walls of the

building which are affected by the damp by hacking off the plaster, brushing well down, after raking the joints to form a key, and then cementing I in. thick with Pudloed cement. A thin film of Parian or keene may be used to finish. This system has never exceeded the expense to owners of condemned cottages. Many sanitary inspectors have induced [illegible] to adopt it to save them or one of the dilapidated cottages of their possession. It is not at all a pleasant task for a sanitary inspector to have to inform the owner of a small cottage that his house is condemned simply through dampness. Such a man will sometimes be unable to afford the excessive cost of inserting a new damp-course, especially if the walls are thick.

The new system is extremely economical, because the cost of the Pudlo for ordinary cases is only 9d. per yard, to which must, of course, be added the man's time and the cost of the cement and sand. The I in. thickness of Portland cement keeps back the dampness, and the most that it ever rises by capillary attraction and the heat of the room in driving it higher is 2 ft., so that if the cement is rendered 2 ft. higher than the existing dampness shows, that is quite sufficient. Sometimes it is only necessary to render a dado round the room. . . .—Yours, &c.,

J. H. Kerner-Greenwood

THE ROAD BOARD AND ULSTER.

To the Editor of The Surveyor.

Sir,—With reference to the paper on "Road Improvement in the North of Ireland," by Mr. J. W. Leebody, which appeared in the issue of The Surveyor for August 21st last, I beg to enclose herewith, for your information, copy of a letter which I have to-day addressed to Mr. Leebody, and dealing with his remarks as to the policy of the Road Board in [illegible] &c.

H. P. Maybury.

Road Board Offices,
Queen Anne's Chambers, S.W.
September 8, 1914.

[COPY OF LETTER REFERRED TO.]

Dear Sir,—The attention of the Road Board has been called to your paper on "Road Improvement in the North of Ireland," published in The Surveyor of 21st August, in which you say: "It is rather unfortunate that the Road Board policy in Ulster has, for so far, been to look with a more friendly eye on grants for tar treatment than on those for improved drainage."

The board think it important that I should correct the mistaken impression to which you give publicity. The attitude of the board is just the reverse of what you state. Improved drainage, where required, must obviously precede any form of improved surfacing, whether by tar treatment or otherwise.

As regards tar treatment, the board have not by any means urged such treatment in Ulster or in any part of Ireland. Grants for over £63,000 have been made in Ulster, and only about £7,000 of that amount represents tar treatment, and the latter figure has been almost confined to Antrim, with a small amount in Armagh.

Roads which have to carry much motor traffic require, for durability, treatment with tarry or bituminous substances, but tar treatment can only be justified on roads on which the traffic is substantial in volume, and the annual cost of maintenance is greater than it is, generally speaking, on rural roads in Ireland.

Yours faithfully,
(Signed) H. P. Maybury.

J. W. Leebody, Esq., B.A., B.E., County Surveyor, Tyrone (South) County Council, County Surveyor's Office, Dungannon.

PRECAUTIONS AGAINST EPIDEMICS.

To the Editor of The Surveyor.

Sir,—Judging from the weekly mortality returns of the big towns, the medical officers' returns of the smaller towns, urban and rural district councils that are published, the country, as a whole, is at present in a very healthy state. The reason generally given is the advancement of scientific sanitation; but it has been almost neglected in some parts. How is it, then, to be accounted for? Surely, by the remarkable weather conditions, especially the health-giving winds bringing increased quantities of purifying oxygen, the germ-destroying active rays of bright sunshine, and also, to some extent, the consequent desiccating droughts, heavy, cleansing rains, cool summers and mild winters which of late years have prevailed, as against the calm, gloomy, sultry, muggy and thundery conditions which have been comparatively absent, and are conducive to those diseases brought about in conjunction with neglected sanitation. A close analytical comparison between the meteorological and the medical officers' returns available would bring out many facts at present little thought of, it is certain.

If history repeats itself, as it generally does, are we prepared? Have we done our best to forefend against what is likely to occur after a serious crisis such as we are going through at present? Is not delay like tempting Providence? Are we to wait for an epidemic before anything is done? Does it not show more than ever the necessity for a central board of thoroughly qualified members who could judge each case impartially, and on its own merits? In fact, should they not be the last word in practical experience by which is meant, in this case, science made as perfect as possible.—Yours, &c.,

G. W. B. Mactuck
(Author of "Hydrology of the Howdenshire District").

COTTAGE BUILDING.

To the Editor of The Surveyor

Sir,—A Local Government Board Inquiry is just about to be held in this town for the loan of £61,000 for carrying out a housing scheme, which has already received the sanction of my council.

I propose carrying out the roads, sewers, &c., by administration, but I have not yet decided as to whether I shall invite tenders for the building of the cottages.

I shall therefore be glad if any of your readers who have carried out similar schemes, and have built the cottages by administration, will kindly communicate with me.—Yours, &c.,

A. Ernest Prescott,
Borough Surveyor.

Eastbourne.
September 8, 1914.

Town Planning Schemes.—It is understood that the Local Government Board have given authority for the preparation of five further town planning schemes under the Housing and Town Planning Act, 1909. The schemes are authorised to be prepared by the corporations of Barrow-in-Furness, Nelson, and Newport (Mon.), and the urban district councils of Hendon and Otley.

Glasgow Sewage Works.—The Glasgow Corporation Sewage Committee recommend the preparation of the necessary specification, schedule, and plans for the construction of the sludge main outside of the Dalmarnock and Shieldhall works, and the carrying out of the excavations necessary for the third section of the filter beds. The estimated cost of this section amounts to £33,000.

Destruction of Bangor Slums.—The Bangor City Council some time ago ordered the demolition of a number of houses in Kyffin-square, which the medical officer had condemned as unfit for human habitation. The owners appealed, and the Local Government Board held an inquiry. The board have now reported to the Bangor Council that, after careful consideration, it had been decided that the demolition orders must be carried out, the cost of the appeal to be paid by the protesting owners.

Road Locomotives.—Germany exported in 1912 steam road locomotives, steam rollers and traction engines to the value of £1,043,600, as against £628,300 worth of road locomotives and steam rollers imported from the United Kingdom in 1913, and steam road locomotives and traction engines to the value of £71,300 from Austria-Hungary. The Russian market offers the largest scope for British enterprise, the combined German and Austrian exports to Russia annually being about £578,900 against the British exports, which amounted to £18,700 only. Other large markets worthy of serious consideration by British exporters of road locomotives (the *Standard* points out) are Brazil, France, Spain, Italy, Bulgaria, Rumania, Turkey and Egypt.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address. If correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction, i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

ENGINEER AS ARBITRATOR UNDER CONTRACT. BANKRUPTCY OF CONTRACTORS. TRUSTEE'S POWER TO EXAMINE ENGINEER. A decision of the Court of Appeal [illegible] the Court of the county court judge in the matter of the bankruptcy of Messrs. Marshall Deakin & Jones, against the refusal of the county court judge to make an order directing that the engineer to the contract between the contractors and Messrs. Marshall Deakin & Jones against the refusal of the county court judge to make an order directing that the engineer to the contract between the contractors and the bankrupts should be examined by the trustee under section 27 of the Bankruptcy Act, 1883. That section provides that [illegible] person whom it may deem capable of giving information respecting the bankrupt, his dealings or property, may be summoned by the trustee to be examined by the Trustee in Bankruptcy. The ground of the refusal was that the engineer could not give any information that was not already in the possession of the bankrupts. Mr. C. Atkinson, K.C., and Mr. E. J. Rimmer appeared for the appellants, and Mr. Langdon, K.C., and Mr. Hanson for the respondents. Mr. Atkinson said that the decision of the county court judge was clearly wrong because the object of the section was to enable the trustee to obtain facts from the witness about which the information given by the bankrupts might be either incorrect or unreliable. He was stopped by the Court. Mr. Langdon, K.C., said that he could not support the ground of the decision of the county court judge, but he urged strongly that, as the engineer had, under certain matters in relation to the contract, an absolute discretion, and as all other matters must be referred to him as arbitrator, his capacity under the contract was purely judicial, and he ought not, therefore, to be called upon to answer questions relating to these matters. The Court allowed the appeal, and ordered that the engineer should attend for examination. Mr. Justice Horridge said that the grounds of the decision of the county court judge were clearly wrong, as otherwise examinations under the section would be abortive. Mr. Langdon had, however, raised a more formidable point, and if he thought that the examination would necessitate the engineer giving a decision upon matters which would afterwards come before him as arbitrator, he would not have made the Order. He was, however, not satisfied that there were no matters upon which it was proper that the trustee should have information which did not require him, in answering, to anticipate his decision as arbitrator. In this case there had been a forfeiture by the building owners, and the trustee was entitled to examine the engineer to find out what had been the course of proceedings since the contractors went off the work. There were, in his opinion, also other matters about which the engineer could give the trustee information which he was entitled to know. Mr. Justice Lush agreed. Leave to appeal was given.

HOUSING ACTS. "OBSTRUCTIVE BUILDING." WORKSHOP.—An important point as to the powers of the local authority under the Housing Acts to pull down a building was decided in *Judge v. Knutsford Urban District Council* (July 9th, Chancery Division, Mr. Justice Eve). Sec. 38 of the Housing of the Working Classes Act, 1890, provides that, if a medical officer of health finds that "any building," although not in itself unfit for human habitation, is so situate that by reason of its proximity to or contact with any other buildings it causes one of the detrimental effects particularised in that section, he is to notify the local authority, to whom power is given to pull down such "obstructive building." The council, proceeding under this section, gave notice that they proposed to pull down a workshop belonging to the plaintiffs. This was followed by a notice that the council intended to purchase the site of the workshop, and by a counter-[illegible] from the plaintiffs if they wished to retain the site on receiving compensation for the pulling down. Negotiations were entered into, but, no agreement being come to, the council gave notice that they would apply for the appointment of an arbitrator. The plaintiffs then brought this action, claiming a declaration that they were entitled to the workshop without let or hindrance from the council, and an injunction to restrain the council from taking steps to demolish the building. In support of the plaintiff's case it was contended that the workshop was not a "building" within the meaning of the section, the argument being that the parenthetical clause "although not in itself unfit for human habitation" indicated that the enactment only applied to buildings intended for human habitation. Mr. Justice Eve, however, held that the section applied to buildings of every description, and moreover that the plaintiffs, by their conduct, were estopped from denying that the workshop was not within the section. The action was dismissed with costs.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

LAYING OUT NEW STREETS.—"Tapo" writes: AB is a road which has not been taken over by my council, but was made, in the first instance, as an occupation road for the purpose of giving access to land and houses belonging to different owners. It ends in a cul-de-sac, and has been used by the public for the past thirty years. A private company have bought land abutting on to the road AB for building purposes, and they have forwarded an estate plan showing their intention of laying out part of the estate. The company contend that AB is their approach to the land, and in order to comply with by-law No. 2 (copy forwarded) they have set back the houses 15 ft. from the centre of the road AB so as to make a street 30 ft. wide. The street from C to D is 18 ft. wide, and the back street EF is shown to be 9 ft. wide. The land at the rear belongs to another owner, but if bought by the company it could be utilised for building purposes. (1) Is AB the company's approach road, or have they only the right of user, as the land and houses below B belong to different owners, and consequently the company could not close the road? (2) Should not CD be their approach road, and, in consequence, to comply with the by-laws be 30 ft. wide? (3) In order to comply with By-law 5 and 5a, should not the back street EF be 18 ft. wide? (4) If the land at the rear was purchased and laid out as shown, would not the streets between the fronts of the houses be 30 ft. wide, and they would if CD in question 2 was not the principal approach, be approached by a street 18 ft. wide? And would not this be a sufficient reason for making the street CD 30 ft. wide?

[COPY OF BY-LAWS.]

(2) Every person who lays out a new street as a carriage road, shall lay out and form such street at least 30 ft. wide.

(4) Every person who shall construct a new street which shall exceed 100 ft. in length, shall construct such street for use as a carriage road, and shall, as regards such street, comply with the requirements of every by-law relating to a new street intended for use as a carriage road.

(5) Every person who lays out a new street which shall be intended for use otherwise than as a carriage road, and shall not exceed in length 100 ft., shall so lay out such street that the width thereof shall be 18 ft. at the least.

(5a) Provided always that this by-law shall not apply in any case where a new street shall not be intended to form the principal approach or means of access to any building, but shall be intended for use solely as

The Surveyor

And Municipal and County Engineer.

a separate means of access to any premises for the purpose of removing therefrom the contents of the receptacle of any privy, or of any ashpit, or of any cesspool, without carrying such contents through any dwelling-house or public building, or any building in which any person may be, or may be intended to be, employed in any manufacture, trade or business.

(1) I presume that by the expression "approach road" is meant a road which is intended to form the principal approach or means of access to a building or buildings. In this sense the road AB appears to be an "approach road." The company's rights with respect to the road depend upon circumstances. (2) Although originally an occupation road, it may have become a public highway (notwithstanding that it has not been taken over by the council), or it may have been conveyed to the company subject to the existing rights of way, public or private; (c) or, again, a right of way over the road may have been granted to the company in common with other owners or occupiers. (3) Apparently the road CD is not intended solely as a separate means of access for removing dust, &c. Unless so intended, it is not within the exception provided for by by-law 5a, and if it is being laid out as a carriage road it must be 30 ft. wide. It is to be observed that, in order to come within the above exception, a road must fulfil two conditions—viz., (a) it must not be intended as the principal approach or means of access to a building, and (b) it must be intended as a separate means of access for removing refuse, &c. If it does not fulfil condition (b) it is not within the exception even though it may fulfil condition (a). (3) Yes, unless it fulfils conditions (a) and (b) above mentioned. (4) See reply to No. 2. The street between the houses shown in red would have to be 30 ft. wide if laid out as a carriage road, unless it fulfilled conditions (a) and (b).

COMBINED DRAIN.—"W. S." writes: A is the owner of two tenements separated by an occupation road. The drainage (which includes the rainfall pipes from each house) is piped into a drain laid in the road and thence forward to the stream. The rural council have laid sewers within 100 ft. from the houses, and called upon A to connect the drainage thereto. He (A) alleges that the drain in the road (taking the drainage of two houses) is a sewer, and that it is the duty of the rural district council to do the work. The regulations of the council do not permit the admittance of rain water to the sewers, and to connect the existing drain to the sewer would, of course, violate their own regulations. The rural district council contend that these houses have not sufficient drainage, as per sec. 23 of the Public Health Act, 1875. Will you kindly say if, in your opinion, A is right in his contention, or would the rural district council be justified in carrying out the work of laying new drains for the sewage only?

The road drain is a "sewer" from the point at which it receives the drainage of the two houses. If the house drains are sufficient for effectual drainage the council cannot proceed under sec. 23, but they could proceed under sec. 24.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Bishop's Stortford U.D.C. (August 27th. Mr. E. Dudley). £1,980 for the purchase of the Wharf House estate for the purpose of council offices and depot, and property in Danes-street for street widening.—Mr. C. J. Hancox, clerk of the council, stated that the present offices and depot were inadequate, and that Dane-street had become too narrow for the increased traffic of the district. The surveyor, Mr. R. S. Scott, explained the nature of the proposed works. There was no opposition.

Bispham U.D.C. (August 25th. Mr. A. G. Drury). £1,805 for the widening and improvement of Red Bank-road.—The amount was made up by £330 for the purchase of the land, and £1,475 for the improvements. The area of the land was stated to be 2,513 sq. yds., which worked out at something like 2s. 7½d. per yard, but on the top of that there was the cost of sewering. The surveyor, Mr. T. Harrop, submitted the details of the proposed works.

Bradford T.C. (September 2nd. Mr. M. K. North). £5,740 for the construction of an open-air swimming bath at Lister Park.—It was stated that the bath would be 150 ft. long and 60 ft. wide, the depth at the deep end to be 6ft. 6 in., and at the shallow end 3 ft.

Brighouse T.C. (September 2nd. Mr. H. R. Hooper). £1,400 for repaving the Bradford and Huddersfield road.—£1,100 for the cost of installing automatic clocks on gas lamps, and £583 for works of sewerage in a number of small streets.—With respect to the highway repair, the town clerk stated that the work was being done with the sanction of the West Riding County Council, and the latter authority would pay the annual sums of principal and interest. As to the placing of clocks on gas lamps, the corporation had already made extensive experiments, and, having found the system to work satisfactorily, they were now desirous of extending it to all the lamps in the borough. There was no opposition.

Cleckheaton U.D.C. (September 8th. Mr. F. O. Stanford).—£2,200 for the purposes of the electricity works.—It was stated that it had originally been intended to expend a much larger sum on extensions and alterations. The present application refers to the cost of a storage reservoir and of a new switchboard. The council intended, in view of prospective distress on account of the war, to make the reservoir with direct labour.

Grimsby T.C. (September 8th. Mr. Edgar Dudley).—£4,620 for the purchase of land on the Bradley estate for the purpose of public walks and pleasure grounds.—The town clerk, Mr. J. W. Jackson, said that the estate recently came into the market, and an excellent opportunity presented itself for the corporation to acquire it. The purchase was made at public auction at a very low price.

Nelson T.C. (September 1st. Mr. H. R. Hooper). £21,500 for the purchase of part of the Reedyford estate for the purpose of a refuse tip.—The borough surveyor, Mr. W. Shackleton, stated that the land it was proposed to acquire was 28.068 acres in extent. The estate formed a natural valley or basin suitable for tipping purposes; in fact, it would not be possible to use the land to advantage without tipping. The total available tipping space was about 483,000 cub. yds.

Newry U.D.C. (September 1st. Mr. A. D. Price).—£1,200 for the extension of the town hall, £700 for the construction of a new road, and £150 (supplemental) for the completion of the erection of lodging-houses.—Mr. Wm. Cronin, town clerk, and Mr. Charles Blaney, surveyor, gave details of the proposed schemes.

Plymouth T.C. (August 28th. Mr. W. O. E. Meade-King).—£1,561 for street improvement works in Peverell Park-road-lane East, Whiteford-road-lane, Pounds Park-road-lane North, Beechwood-avenue-lane, and Ladysmith-road.—The borough engineer, Mr. J. Paton, submitted details of the work, and the mayor and Mr. W. C. Willey supported the application, stating that the improvements were urgently needed, and had been requisitioned by the residents.

Poulton (Lancs) U.D.C. (August 18th. Mr. F. H.

[illegible] street improvements. It was stated that the [illegible] to repair one of the [illegible] Mr. R. Mo[illegible] [illegible] proposed work, and [illegible] [illegible] the work had been [illegible]

Saffron Walden T.C. (August 18th. Mr. A. G. [illegible] £180 [illegible] the purchase of a steam [illegible] the [illegible] meeting Mr. V. H. [illegible] moved that the consideration of the [illegible] be deferred for a year.

Skipton U.D.C. (September 1st. Major J. [illegible] £700 [illegible] the extension of the sewage [illegible] and [illegible] Mr. A. E. W. Mabbs [illegible] the scheme in order, and the inspector, in [illegible] a question, replied it would be advisable to proceed with the preparation of the contracts, said [illegible] suggested that a Government Board would [illegible] the [illegible] scheme.

Sunderland T.C. (September 4th. Mr. H. R. Hooper [illegible] the gas undertaking.—Evidence given by the borough accountant (Mr. J. Patrick) and by the electrical engineer (Mr. A. S. Blackman) was to the effect that the loan was required for the renewal of mains, extensions, and additional machinery. It was stated that the existing [illegible] the undertaking had been reduced to [illegible] 7 to [illegible] six years.

Thurrock, Grays, and Tilbury Joint Sewerage Board (August 27th. Mr. P. M. Crosthwaite).—£99,857 for the purposes of sewage disposal, including the execution of works in the parish of West Tilbury.

Mr. Maurice Taylor explained that the scheme was for a main intercepting sewer starting in Purfleet. The whole of the sewers were designed in accordance with the requirements of the Local Government Board—laid in straight lines, and provided with manholes approximately some 100 yds. apart. The district was extremely flat, and there was very little difference between the level of the ground at the railway crossing and the level at the outfall site. He explained in detail the line through the district it was proposed to sewer, from Purfleet, picking up Grays, and on to Tilbury, and carrying a length of sewer to the outfall works, which would be outside the [illegible] district.

APPLICATIONS FOR LOANS.

Alnwick U.D.C. £6,950 for the erection of cottages, and £350 for road work.

Ammanford U.D.C.—£1,725 for water supply extension.

Bridgwater R.D.C.—£770 for the purchase of a steam roller.

Cardiff T.C.—£2,372 for works in public parks.

Darwen T.C.—£1,125 for the construction of a bowling green, bowl house, and tennis courts.

Dewsbury T.C.—£3,200 for works of sewerage.

Halifax R.D.C.—£2,610 for road improvement.

Hereford R.D.C.—£3,600 for hospital extension.

Horbury U.D.C.—£4,900 for the provision of a recreation ground.

Leek U.D.C.—£2,455 for new streets.

Little Lever U.D.C.—£7,321 for a housing scheme.

Mansfield Woodhouse U.D.C.—£2,500 for laying out a park.

Middlesbrough T.C.—£4,350 for the purchase of a site for a school.

Newcastle-on-Tyne T.C.—£10,710 for road widening.

Reading T.C.—£6,500 for road improvement.

Sowerby Bridge U.D.C.—£2,610 for road improvement.

Stroud U.D.C.—£500 for the purchase of land for a housing scheme.

Swindon T.C.—£33,000 for sewage works extension.

Wigan T.C.—£27,165 for the erection of 138 workmen's dwellings, and £11,881 for repaving works with setts or cubes.

LOANS SANCTIONED.

Ashton-under-Lyne T.C.—£42,000 for extensions to the electricity works, £14,000 for improvements at the sewage works, and £426 for alterations to the Textile School.

Atherstone R.D.C.—£1,440 for the purchase of land for a housing scheme.

Brixham U.D.C.—£3,810 for the provision of working-class dwellings.

Bosmere and Clayton R.D.C.—£1,300 for a housing scheme.

Burnley R.D.C.—£450 for sewerage work.

Caerphilly U.D.C. £2,853 for laying out a recreation ground.

Deptford B.C.—£1,500 for the erection of washing baths.

Malvern U.D.C.—£1,600 for electricity plant.

Oxford T.C. £1,000 for sewerage [illegible].

Pebworth R.D.C. £2,2[illegible] for a housing scheme.

Portslade U.D.C.—£3,300 for works of surface-water drainage.

Romford R.D.C.—£2,095 for private street improvement and £4,9[illegible] for works of sewerage.

Swaffham U.D.C.—£1,110 for cemetery extension.

Torquay T.C.—£5,000 for electric lighting mains extension.

Wakefield T.C.—2,450 for sewer reconstruction.

Welwyn R.D.C.—£1,332 for works of water supply.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

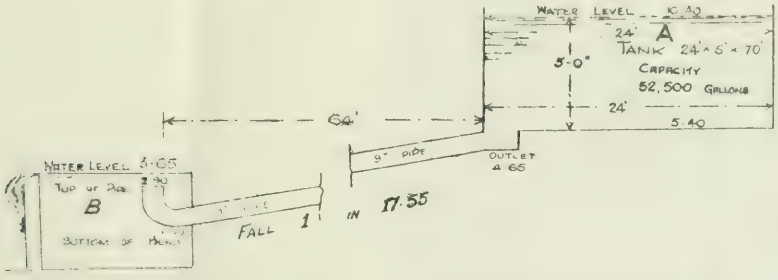
QUESTIONS.

This week answers are invited to the following questions:—

417. Sewer Construction.—A sewer is being constructed partly in tunnel. Describe a method of giving the levels in the heading, referring specially to the continuation of the line of levels from the surface. (Xmq.)

418. Iron Curved Roof.—Show details of an iron curved roof of 40-ft. span, resting on girders and stanchions on one side, and on a 14-in. brick wall on the other. The roof is to be covered with corrugated iron. Show enlarged details at the foot of the principal rafter at each end. (K. G. F., *Buckfastleigh.*)

420. Flow of Water. Assuming that the lower tank B in the accompanying diagram is full of water, and also the 9-in. pipe up to the level of 3·65, what time would it take to empty tank A if the outlet was open full bore? (A. S., *Beverley.*)



421. Reactions of Beams. Show how to find (graphically or otherwise) the pressures on the two supports of a horizontal beam which is loaded at any given points.

422. Building Construction.—The earth in front of a semi-basement to a house has to be supported for a depth of 6 ft. Give a section of a suitable retaining wall, and prove its stability by a graphic diagram.

423. Sewer Construction.—Show by sketches (plan and section) the junction of a 3-ft. and a 5-ft. brick barrel sewer.

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

419. Practical Mathematics.—Explain a graphical method for solving simple simultaneous equations, and give a worked example.

Consider the two simultaneous equations—

$$3x + 7y = 27 \quad . \quad . \quad . \quad (1)$$

$$5x + 2y = 16 \quad . \quad . \quad . \quad (2)$$

they could be written $x = \frac{-7y + 27}{3}$ . . . (*a*)

and $x = \frac{-2y + 16}{5}$ . . . (*b*)

In the two equations (*a*) and (*b*) we could insert a series of values for y, and obtain a series of values for x. If we then plotted the values for (*a*) and those for (*b*) we would obtain two distinct graphs, both of which would be straight lines, as the equations are of the first degree. We want now values of x and y which, when put into (1) will solve it, and which when put into (2) will solve it also. Or, graphically, we require the co-ordinates of a point on the graph of (1) which are equal to the co-ordinates of a point on the graph of (2). (*a*) and (*b*), of course, yield the same graphs as (*a*) and (*b*). Obviously these two points must coincide, since their co-ordinates are the same, and this will take place at the intersection of the two graphs.

We can now proceed to plot the graphs and find the co-ordinates of the point of intersection, and thus find the values of x and y, which will solve the two equations. Since the graphs are straight lines it will only be necessary to have two points on each. Looking at (1) and (2), the easiest way to find two values for x and y in each is to make first $x = 0$, and then $y = 0$. When we come to plot them we shall find that we have found the points where the two graphs cut the axis of x and of y.

Proceeding with this side by side we have—

$3x + 7y = 27$ . . (1)	$5x + 2y = 16$ . . (2)
put $x = 0$ $0 + 7y = 27$	$0 + 2y = 16$
$y = 3{\cdot}86$	$y = 8$
$x = 0$	$x = 0$
put $y = 0$ $3x + 0 = 27$	$5x + 0 = 16$
$x = 9$	$x = 3{\cdot}2$
$y = 0$	$y = 0$

Tabulate the results as follows

Equation (1).		Equation (2).	
x	y	x	y
0	3·86	0	8
9	0	3·2	0

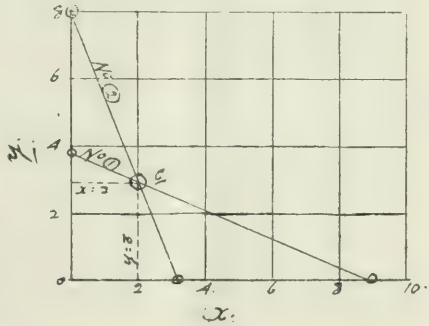


FIG. 1.

Plotting these values (Fig. 1) we see that the co-ordinates of the point of intersection are $x = 2$, $y = 3$,

and these are the values which will solve both equations simultaneously.—(N. S. J., *Darlington*.)

Notes.

A correspondent has submitted the following general notes on the graphical solution of simultaneous equations of a higher degree than the first:—

I propose to detail the general mode of procedure for solving simultaneous equations, to work through, step by step, a suitable example, and finally to indicate the special cases which occur in actual practice, together with hints, &c., for rapid and easy solution. First, examine the equations very carefully, noting the highest power of any term, and endeavour to ascertain roughly what are the practical working values of the equations. Next, arrange the terms in each equation so that it is presented in the most convenient form for substitution of different values. Now arrange the component terms in a vertical column, one under the other, and in the lowest space write the complete equation. Rule out in tabular form for a number of values (see Table I.). By this means it is easy to perceive at a glance any error made in working out values, should it be found that the plotted curve did not assume a regular shape. We now proceed to give numerical values to x (if the equation is a function in x), and work out the value of the equation for such values. Care and discrimination must be exercised in giving the values to x, and by trial it should soon be found what are the "working values." Always try the value "x equals zero," and note what value of x reduces the expression to zero or to infinity (if any). Never omit to give negative values as well as positive, particularly in the case of a hyperbolical expression. Having obtained a suitable number of values, notice the ranges of the values, positive and negative, of the ordinates and abscissæ. Choose the scales of representation so that the graphs take up the whole of the space at our disposal. This latter is a most important point, as it enables us to plot the graphs, and to read off values ultimately, with very great accuracy. Even so, if extremely accurate results are required, it is advisable to draw out to a larger scale those portions of the graphs where they intersect, carefully selecting a few points in the neighbourhood. Thus, in the worked example, it would be advisable to draw out two more graphs giving values to a greater degree of accuracy, one for the point (*a*) and the other for the point (*b*). Let us suppose we have to solve graphically the simultaneous equations:—

$$y = x^3 - 3x + 2 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad \text{(i)}$$

$$x - 2y - 2 = 0 \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad \text{(ii)}$$

We will first of all deal with the second equation. It can be rearranged, and thus becomes $2y = x + 2$ *i.e.*, $y = \frac{x+2}{2}$. It is immediately obvious that this graph is *a straight line*, for it only contains terms of the first degree, and is thus of the form $ax + by = 0$.

It is important to notice that we need take two values of x only (fairly wide apart for accurate drawing), as only one straight line can pass through two points. Let us at once derive suitable values for this equation. Thus—

when $x = 0$, $y = 1$

and when $x = -2$, $y = 0$

We now turn our attention to equation (1), and proceed to give suitable values to x, and work out the values of y—*i.e.*, of x^3+2. Arranging the work in tabular form, as detailed above, we obtain the following:—

x	−3	−2	−1	0	+1	+2	+3
x^3	−27	−8	−1	0	+1	+8	+27
$-3x$	+9	+6	+3	0	−3	−6	−9
$y = x^3 - 3x + 2$	−16	0	+4	+2	0	+4	+20

Table I.

Plotting the above values and the two values of equation (1) we get a graph of the two, as shown in Fig 1. It will be seen that the curves intersect in three points, A, B and C, and since each of these points is on *both* graphs, it follows that the value of x and the value of y at each point give solutions to the equations—*i.e.*, they give the common roots of the

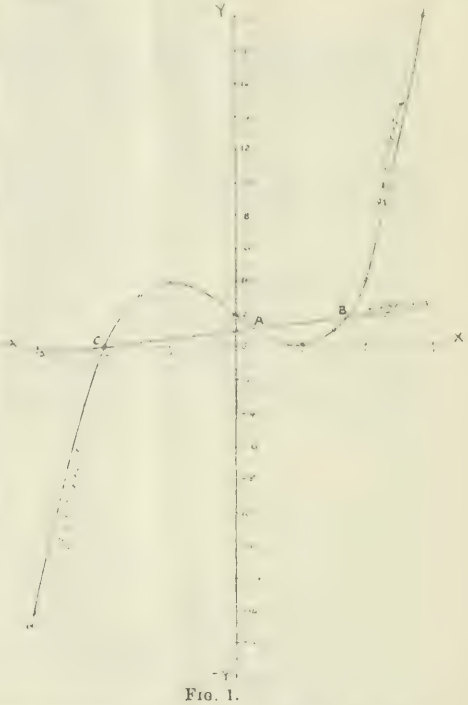

Fig. 1.

two equations. Reading off the values from the graph, we see that the roots common to the two equations are:—

$$\begin{array}{lll} x = +0{\cdot}30, & +1{\cdot}72; & -2 \\ y = +1{\cdot}15, & +1{\cdot}85; & 0. \end{array}$$

(To be concluded.)

Cost of Sewage Treatment at Leeds.—In the report of the Sewerage Committee of the Leeds Corporation for the year ended March 31st last, it is stated that the cost per 1,000,000 gallons of sewage treated at the Knostrop works was £2 2s. 5d., as against £1 16s. 7d. for the previous year. The increase of 5s. 10d. per 1,000,000 gallons was in the main accounted for by the stoppage of the sewage purification work during the thirty-two days of the municipal employees' strike, which, in conjunction with the diminished volume of flow caused by the absence of rainfall, had reduced the average total volume pumped and treated on the works by nearly 1,750,000 gallons per day. The total cost of running the sewage works for the year shows, however, a reduction of £500 when compared with the figure of the previous year.

Preliminary Studies in Bridge Design.—This little book,* a reprint of articles which appeared in The Surveyor and Municipal and County Engineer, is intended as the first of a series of similar volumes which, taken together, will form a treatise on the design of ordinary highway bridges of moderate spans. This first volume goes further back in the evolution of the bridge than do most treatises, and considers the bridge in its essential elements, that is as the means of providing a crossing for man and beast across a watercourse. The bridge engineer is apt to forget this primary purpose and to consider his bridge merely as a framework or a carrier of stresses. Mr. Ryves, in a refreshingly original manner, has emphasised the necessity for studying natural and economic predispositions, one might say, of the bridge site, with a view toward producing, not the best type of bridge, but the best method of getting the river and the traffic across one another. . . . —*Engineering News*, New York.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below:—Buildings: Buxton £15,000, Portrush £17,140 housing and town planning—Kingstown £40,000, Wigan £27,100 roads and materials—Battersea £24,475, Bexhill £20,000, Hove £7,400, Reading £13,000, Wigan £11,881 sewerage and sewage disposal, Accrington £18,500 water, gas and electricity—Southam—Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Bridlington T.C.—The council have approved the plans of the borough surveyor, Mr. E. R. Matthews, for a fisherman's shelter in the South Cliff Gardens.

Bulkington U.D.C.—It has been agreed to contribute £50 towards the reconstruction of the bridge over the Coventry Canal in Bedworth-road, the total cost of which will be upwards of £1,000.

Buxton U.D.C.—A scheme has been adopted for rebuilding the natural baths, at an estimated cost of £15,000.

Leeds T.C.—A site between Aire-street and the River Aire is to be purchased for the purpose of building a new electricity generating station.

Portrush U.D.C.—Consideration is being given to designs for a new town hall, public baths, technical school and underground lavatory, which are estimated to cost, collectively, £17,140.

HOUSING AND TOWN PLANNING.

Horwich U.D.C.—A scheme is to be prepared for the erection of fifty workmen's dwellings.

Kingstown (Co. Dublin) U.D.C.—Negotiations are in progress for the purchase of four sites for the erection of workmen's dwellings at an estimated cost of £40,000, and meanwhile the council are seeking to obtain sanction to a scheme for thirty-seven cottages at Sallynoggin, at an estimated cost of £7,900.

Mansfield Woodhouse U.D.C.—The surveyor, Mr. F. P. Cook, has received instructions to prepare a town planning scheme.

Nelson T.C.—The council have approved the scheme of the borough surveyor, Mr. W. Shackleton, for the erection of workmen's dwellings at Catlow.

Newport (Mon.) T.C.—The Somerton housing scheme is to be proceeded with at the earliest date possible.

Plymouth T.C.—A housing scheme involving the destruction of a large number of insanitary dwellings is being considered by the Housing Committee.

Truro R.D.C.—It has been agreed to proceed with a housing scheme at St. Just, where ¼ acre of land has been purchased for £50.—Regarding a site at Gerrans for housing, the clerk read a letter stating that for ¼ acre the owner required £230 12s. 6d. The clerk also read a list of conditions, at the end of the reading of each of which several members uttered groans. Another owner wrote that he would sell ¼ acre at the rate of £300 per acre. These offers were not accepted by the council.

Wigan T.C.—The council have adopted the scheme prepared by the borough engineer, Mr. A. T. Gooseman, for the erection of 138 workmen's dwellings on the Melverley-street site, and the making of the necessary roads in connection therewith, at an estimated cost of £27,165.

PARKS AND OPEN SPACES.

Leek U.D.C.—The surveyor, Mr. W. E. Beacham, has been asked to prepare a scheme for laying out Brough Park, with bandstand, pavilion, bowling green and shelter.

Manchester T.C.—Barlow Hall estate is to be acquired for the purpose of a public park and recreation ground, and a boating lake of 45 acres is to be constructed.

Mansfield Woodhouse U.D.C.—A scheme has been approved for laying out Yeoman Hills park, and the provision of a caretaker's lodge, at an estimated cost of £2,500.

Newcastle-on-Tyne T.C.—The Town Moor and Parks Committee are considering the question of providing a recreation ground in the Welbeck district of Byker.

ROADS AND MATERIALS.

Ammanford U.D.C.—A stone-crusher is to be purchased so that out-of-work men can be employed in taking stones from the River Amman.

Armagh C.C.—The council have referred to the Distress Committee a report by the county surveyor recommending a scheme for considerable works on main and local roads, towards which it is hoped the Road Board might be prepared to contribute.

Barry T.C.—Application has been made to the Road Board for a grant of £8,000 for the widening of Fort-road.

Battersea B.C.—The council are recommended by the Highways and Works Committee to carry out paving schemes at an estimated cost of £24,475, and to submit the matter to the Road Board for their favourable consideration.

Beccles T.C.—Steps are being taken with a view to making up the roads on the Grange estate.

Blackpool T.C.—The Highways Committee have approved a proposed scheme of the Road Board with respect to the road between Blackpool and Poulton. The board are in favour of the construction of a new road, at an estimated cost of £26,000, in preference to a scheme for straightening and improving, and they are prepared to make a contribution of £20,000. The details will be arranged with the county council by a small subcommittee of the Highways Committee.

Brampton R.D.C.—The surveyor, Mr. J. Mark, has received instructions to construct a new road, at an estimated cost of £243.

Cockermouth R.D.C.—The council have agreed to the suggestion of the county council that plans for the erection of new buildings adjoining county main roads, so far as the building line is concerned, should be submitted to the county surveyor before building operations are commenced.

Colchester T.C.—It has been decided to construct a 15-ft. roadway on St. John's Green.

East Grinstead R.D.C.—The surveyor, Mr. C. Turton, in a report on the tarring operations during the present season, states that 117,386 sq. yds. were tarred, at an average cost of 1·14d. per yard.

Frome U.D.C.—Plans are to be prepared for a scheme of street widening at Broadway, and for sewer extensions at Marston-road.

Hove T.C.—It is proposed to carry out several schemes of road improvement, at an estimated cost of £7,400.

Leeds T.C.—Purchases of property are to be made for the purpose of widening North-street, Beckett-street and Czar-street.

Lynton U.D.C.—A letter has been received from the county council stating that the Bridges and Main Roads Committee had had under consideration the question of building a new road to avoid Lynmouth-hill, and were of the opinion that a road through Bonnicott Wood was the most practicable. Before proceeding further, the committee considered that the landowners concerned should be approached with reference to the cost of the land. On seeing plan and a detailed estimate of cost, they would again consider the whole question with a view to obtaining a substantial grant from the Road Board. It was agreed to expedite matters as much as possible.

Newark T.C.—An agreement has been sealed for the reconstruction of certain main roads.

Newcastle-on-Tyne T.C.—A scheme has been adopted for widening North-road, between Clayton-road and the city boundary, at an estimated cost of £15,710, towards which the Road Board are prepared to grant £5,000.

Reading T.C.—In order to provide employment for men thrown out of work by the war the town council

[illegible] adopted a scheme of road widening which will cost £15,000.

Saffron Walden T.C.—The tender of Mr. J. [illegible] at £125 has been accepted for making up Newmarket road. It has been agreed to pave the east side of the path in Gold-street, for a distance of 395 ft., at an estimated cost of £30. The council decided to purchase a quantity of barrels of tar from the Bishop's Stortford gasworks at 10s. 6d. per barrel.

Ware U.D.C.—Considerable purchases of property [illegible] tools with a view to the widening of Star-street towards which a contribution will be made by the county council.

Wells R.D.C.—A committee has been appointed to consider the schemes of road improvement which it is advisable to undertake in order to find work for the unemployed.

Wigan T.C.—The council have adopted a scheme prepared by the borough engineer, Mr. A. T. Gooseman, for repaving various roads with granite setts [illegible] at an estimated cost of £11,881.

Wigtownshire C.C.—The road surveyor to the Rhinns District Committee, Mr. W. K. Gibson, reports that he has received a further sum of £1,000, in addition to the grant of £8,500 and the loan of £16,500, free of interest, already announced, towards the cost of reconstructing and surfacing with tar 50 miles of the principal main roads in the district. Six miles between [illegible] and Kirkcowan have already been thoroughly [illegible] and surfaced.

Wokingham T.C.—The borough surveyor, Mr. C. W. Marks, has been asked to prepare plans for widening Molyneux-road, and it has been decided to make up Crescent road under the Private Street Works Act.

SEWERAGE AND SEWAGE DISPOSAL.

Ammanford U.D.C. Plans, sections and estimates [illegible] the cost of the scheme of sewerage have been approved. The cost is estimated at £18,500, and it was decided to promote a Bill in Parliament to secure the necessary authority and loan to carry out the scheme. The contribution of Ammanford towards the cost of the trunk scheme for the Amman Valley will be about £10,000 additional.

Dewsbury T.C.—It has been arranged to carry out the scheme for the extension of the Mitchell Laithes sewage disposal works by direct labour, under the supervision of the Sewage Disposal Committee.

Hartley Wintney R.D.C.—At a recent meeting of the council, Mr. Schultz referred to a visit paid by the consulting engineer (Mr. T. J. Moss-Flower), who met representatives of the Ratepayers' Association and certain members of the council. The engineer gave a thorough and lucid explanation of the scheme. It appeared that the matter was being tackled thoroughly, and that no more than was absolutely necessary was being done. In connection with the drainage scheme generally at Hartley Wintney, a proper and accurate plan ought to be prepared while the clerk of works was on the spot. Something ought to be arranged expeditiously, or else the council would have to administer the scheme without having any knowledge of the details. Mr. Schultz added that the work had been very well done. Every reasonable point had been thoroughly considered, due allowance having been made both for normal and abnormal conditions. The chairman agreed to the necessity for having the plans, and said he would advise the Sanitary Committee to take the matter in hand.

Norham and Islandshire R.D.C.—The council have instructed Messrs. Taylor & Wallin, civil engineers, of Newcastle-on-Tyne and London, to prepare a scheme of drainage for the colliery district of Scremerston. The scheme will be wholly by gravitation, and no pumping will be required.

Reigate R.D.C.—It has been decided to purchase a cesspool-emptying apparatus and night-soil van for the parishes of Walton-on-the-Hill and Kingswood, and a similar apparatus for the parish of Betchworth, at a cost of £226 each.

Thetford R.D.C.—The Local Government Board have written that, according to the report of their inspector, Dr. Copeman, East Harling, Feltwell, and Methwold were in an extremely unsatisfactory sanitary condition, and that the council had neglected their essential duty with respect to them. In accordance with the advice of the board the council last week resolved to appoint a temporary sanitary inspector.

WATER, GAS, AND ELECTRICITY.

Burnley T.C. A site of 23 acres is to be purchased [illegible] the reservoir and [illegible] road [illegible].

Frome U.D.C.—The council at their monthly meeting held on September 7th accepted the tender of Messrs. James Simpson & Co., Limited, of Westminster, S.W., for new pumps and suction-gas plant to be erected at their water pumping station at Egford, and have instructed Mr. F. W. Jones, their surveyor, to prepare plans for the installation of the same.

Portrush U.D.C.—Owing to serious wastage of the water supply it has been resolved to purchase a waste water detection meter and stethoscope.

Saffron Walden T.C.—A nett profit of £839 was earned by the gas undertaking in the last financial year.

Southam R.D.C.—The council have instructed Messrs. Taylor & Wallin, civil engineers, of Newcastle-on-Tyne and London, to prepare a scheme and report upon a water supply for the parish of Southam, with an extension for supplying the adjoining parish of Long Itchington. The water will probably be taken from a well, and pumping machinery will be required.

Stroud U.D.C.—The surveyor, Mr. G. P. Milnes, has received instructions to prepare a scheme for water softening.

Wadebridge U.D.C.—The Electric Light Company offered to place 50-candle power lamps in place of [illegible]-candle power lamps at a reduction of 1s. per lamp per annum. It was decided that if the company were unable to supply the 60-candle power lamps, they should be asked to make a reduction of half a crown per lamp on the 40-candle power lamps.

Wigton R.D.C.—A water supply is to be provided for Gilcrux and Greengill, at an estimated cost of £700.

MISCELLANEOUS.

Halesowen R.D.C.—The surveyor, Mr. G. H. Dellow, has received instructions to prepare plans for improvements in the rural district.

Newcastle-on-Tyne T.C.—A number of contracts have been passed in order to give employment to men out of work. These included contracts for the erection of a lodge at Armstrong Park, the acquisition of land for Scotswood Recreation Ground, extensions to the City Hospital at Walker Gate, the erection of a propagating house at Leazes Park, and others.

Sewage Scheme for Bulkington.—A sewage scheme is about to be carried out for the parish of Bulkington at a cost of £8,500.

Weymouth Municipal Works. — Weymouth has obtained an Act of Parliament for the carrying out of many important works of improvement, and in accordance with the directions of the Local Government Board they are to be expedited in order to provide employment during the winter and alleviate much of the distress resulting from the war. The first scheme to be proceeded with is a portion of the development of the backwater, a tidal estuary of 250 acres, by the construction of an embankment road across it towards which the Dorset County Council is finding nearly £14,000. This will provide labour for many hundreds, and the Weymouth Corporation is pushing ahead with it with all speed.

The Talbot Car in South Africa.—News has just arrived of a further Talbot win in the reliability trial organised by the Transvaal A.C. for the Schlesinger 100-Guinea Trophy. Over a course of 175 miles, which imposed a far more severe test than the motoring conditions of our own country, the winning Talbot car made a non-stop run, with the lowest petrol consumption in its class, and finished with a score of marks over 10 per cent ahead of its nearest competitor. It was entered and driven by its amateur owner, and competed in full touring rig, winning the Gold Medal in its class, besides the all-comers event for the Schlesinger Trophy contested by both private and trade cars—a fact which enhances the merit of the Talbot's performance. Notwithstanding a depleted staff the manufacture of Talbot cars is proceeding briskly to give prompt deliveries of all models for private or commercial motoring requirements.

PERSONAL.

Mr. William R. Maxwell, L.R.I.B.A., engineer and inspector of Dunfermline, has resigned.

Mr. H. Holmes, M.INST.C.E.I., borough engineer, Dissett, has been called in by the Elland Urban District Council to report on the future extensions at the sewage disposal works.

Mr. H. W. Wilson, surveyor to the Bulkington Urban District Council, has been appointed the council's inspector under the Housing Act at a salary of £75 per annum.

Mr. H. T. Mather, surveyor to the Surbiton Urban District Council, has received condolences from many friends upon the death of his mother at the age of seventy-eight.

Mr. W. T. H. Northcote, a member of the town council, has been appointed borough surveyor of Ilford. He had previously tendered his resignation as a member of the council.

Mr. Thomas Aitken, road surveyor to the Cupar District Committee of the Fifeshire County Council, having asked for the services of an assistant in carrying out the large improvement scheme he has in hand, the committee have agreed to make application to the Road Board for the necessary authority, the appointment to be on such terms as the committee may consider advisable.

Mr. Albert D. Greatorex, borough engineer and surveyor of West Bromwich, as will be seen from our honours roll, entitled "Pro Patria," has achieved distinction by having no fewer than four members of his immediate staff in service with the Regulars or Territorials. Mr. Greatorex, it may be stated, is a member of the National Reserve, and would have been only too happy to head the list. Both of his sons are members of the O.T.C., but are too young for active service yet.

Mr. E. Holloway, engineer and surveyor to the Evesham and Pebworth Rural District Councils, the author of the paper on "Housing in Rural Districts," which appears elsewhere in this issue, took up his present position in 1908, since when he has been

Mr. E. Holloway.

actively engaged in housing matters. He has prepared six housing schemes for his councils, who have erected ninety-six cottages, and have another seventy in hand. The necessity for these dwellings arose from the growth of the market gardening industry and the condemnation and demolition of a large number of very old houses in the district. Mr. Holloway is waterworks engineer for the two councils, who have one of the most up-to-date schemes in any rural area, sixteen villages in their areas being supplied by a gravitation scheme from the Cotswold Hills, which are 10 miles away from some of the villages.

Mr. W. Lloyd Marks, surveyor to the Rhymney Urban District Council, last week completed forty years' service with the council. Born at Carmarthen in 1850, he commenced duty under the now Rhymney Local Board on September 3, 1874. During his term of office he has witnessed the entire growth of Abertysswg (a suburb of Rhymney), the addition of hundreds of houses to the town, the completion of a sewerage scheme, cemetery completed, and the erection of a number of houses under the Welsh Garden City scheme. During the present crisis he has rendered great assistance in the recruiting of young men for Lord Kitchener's Army.

The announcement is made that the old-established firm of Claridge's Patent Asphalte Company, Limited, are embarking upon the manufacture of slag tar-macadam for road construction. A separate company, Carmac Roads, Limited, with offices at Central Buildings, Westminster, and works in Bilston and Chatterley, Staffordshire, has been formed, and municipal and county engineers—among whom he is widely known—will be interested to learn that the firm have appointed as their representative Mr. George Mason. Mr. Mason's many friends will, we are sure, join with us in wishing him success in his new sphere of activity.

COUNTY BOROUGH OF SMETHWICK.
BOROUGH SURVEYOR'S DEPARTMENT.

The Corporation invite applications for the appointment of Assistant in the Borough Surveyor's Office at a commencing salary of £120 per annum.

Candidates must be neat and expeditious draughtsmen, accurate surveyors and levellers, and have had experience in architectural works, including the preparation of working drawings, details, specifications and estimates.

Applications, accompanied by copies of not more than three recent testimonials, must be sent to me under seal, endorsed "Assistant," not later than Wednesday, September 30, 1914.

A. HOSKEN,
Borough Surveyor.

Council House, Smethwick.
September 9, 1914. (1,914)

METROPOLITAN BOROUGH OF PADDINGTON.
BOROUGH SURVEYOR'S DEPARTMENT.

The Council are prepared to receive applications for the appointment of a Third Division Clerk in the Borough Surveyor's Department, at a salary of £70 per annum, rising by annual increments of £7 10s. to £100 per annum. Competitors must be competent shorthand writers and typists, and must be able to undertake all clerical work relating to the branch to be dealt with of the Paving Department work, and prepare the wages sheets of the Department, &c. Preference will be given to candidates who are between 20 and 25 years of age, and who have had experience in a Borough Surveyor's Office. Forms of application, with list of duties and conditions of appointment, may be obtained from the undersigned (upon receipt of a stamped addressed envelope), to whom applications must be delivered on or before Saturday, the 19th day of September, 1914.

(By order)
W. F. ABBISS,
Deputy Town Clerk

Town Hall,
Paddington, W.
September 7, 1914. (1,910)

TEMPORARY ASSISTANTS required (War period) in Municipal Engineer's Office. Write, stating experience and salary required, Box No. 1,465, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,913)

TEMPORARY ASSISTANTS (2), in Clerk's and Surveyor's Department required by Ruislip-Northwood Urban District Council during period of war. Male or Female; salary £2 per week; typewriting, shorthand, accounts and general office work for Clerk Department; for Surveyor's Department, general routine of Municipal Surveyor's Office.—Apply, in writing, with testimonials, to the Clerk, Council Offices, Northwood, Middlesex. (1,912)

THE WAR.

MANUFACTURERS' ANNOUNCEMENTS.

Messrs. Lysaght & Rees, Limited, Poplar, write as follows:—

We have noted with interest and approval the influence which is being exercised by the Press and others to secure the adoption of British goods, and the campaign which has been commenced cannot but help to the ultimate advantage of British industries generally.

But it is very necessary that every precaution should be taken that wrong conclusions (based on pure assumption, or the statements of interested parties having ulterior objects in view) should be avoided.

It has come to our knowledge that the statement has been made, or the impression exists, that this company is to some degree under German influence, and in connection we would state:—

(1) This company has carried on business in England for upwards of sixty years. We were established at Millwall prior to 1854, and a few years later we moved to the site of our present premises, which, with the progress of years, have been enlarged and improved.

(2) There is not a single German connected with the company, either as shareholder, director, or employee. All are British born, bred and educated, with the exception of a few experienced Italian asphalters who are employed for special work, which plan is adopted by all the responsible houses in the asphalt trade.

(3) There is not a penny of German or other foreign capital in this company, the whole of the shares being held by English-born men and women resident in this country. Further, neither this company nor any member thereof has any connection with German or other foreign concerns.

(4) For many years past we have been contractors to H.M. Government for various materials, such as roofing felt, hair felt, asphalt, &c., and for the years 1910-11-12 we were successful in securing the War Office and Admiralty contract for asphalt work, the execution of which necessitated the admittance of our representatives and workmen to practically every fortification and depot of the War Office and Admiralty in the British Isles where our work was required, and to which foreigners are not admitted. This contract was given to us after the usual exhaustive inquiries in regard to the constitution of our company had been made by the War Office authorities.

(5) All goods supplied by us are manufactured here at our works in Poplar.

Possibly your extended experience of our house in itself will substantiate what we are here saying, and doubtless there are many architects, surveyors and builders, some of whom (although very probably now retired) have done business with us over half a century ago.

In conclusion, it might be pertinent to add that on an appeal issued to our factory employees by our managing director (who, we believe rightly, held the view that the seriousness of the present situation had not been fully recognised by at least some of our workpeople), several of our single employees have enlisted, the percentage of acceptances being over 80 per cent of the applicants. Their places are being kept open for them, but in the meantime will be filled by married men, and it may not be necessary for us ultimately to dispense even with the latter's services.

"Ironite," we are asked to point out, is another production which is entirely British made and British owned, being manufactured by Messrs. Archibald Kenrick & Sons, Limited, of West Bromwich. Ironite, it is claimed, will render the most porous concrete and brick work absolutely waterproof against heavy water pressure, and can be applied to existing structures direct without any mixing with cement. It is also being largely used for coating flat roofs in place of asphalt, and comes out at less than half the cost. In regard to Ironite flooring, this, the Ironite Company, Limited, 1 Victoria-street, S.W., state, is the toughest and most wearproof floor on the market. The firm keep large stocks on hand, both of waterproofing and flooring, and can give immediate delivery.

LOCAL AUTHORITIES AND THE WAR.

The whole staff of the electricity department of the Marylebone Borough Council, numbering 200, have been sworn in as special constables.

Richmond (Surrey) Town Council have resolved to pay employees on service full wages less the pay received by them from the Government, and have also decided that their appointments shall be kept open.

The Finance Committee of Heywood Town Council have unanimously decided to recommend that the wages of corporation employees called to the colours shall be paid in full, after deduction of service allowance.

The motor 'buses of the Coventry Corporation, which were put on the streets for the first time this summer, are being taken over by the Government, and will be sent to Aldershot after they have been stripped of their bodies.

Tavistock Urban District Council will keep open the places of any of their employees desirous of serving their country, and will pay the wives of all married men the difference between the service pay and the usual pay under the council.

Northallerton Rural District Council have agreed to grant leave of absence to the surveyor, Mr. T. G. Easdale, and the medical officer in the event of their services being required in connection with Red Cross work, and to pay their salaries.

Hexham Urban District Council have resolved that all employees of the council serving with the Army, Navy or Territorial Forces during the war shall be paid the difference between their service pay and their full wages when in the council's employment, and that they be guaranteed their situations at the end of the war.

All officers and servants in the employment of the Halifax Corporation who join, or have joined the Navy, Army, Reserve, or Territorial forces will be granted leave of absence, and the corporation have decided to provide for the payment to them, or to their representatives or nominees during their absence from civil duty, their full salary or wages, less the deduction of the amount payable by the Government as pay allowances.

The General Purposes Committee of the Ossett Town Council have passed a resolution that all employees on active service shall be paid at the following rates as long as the war lasts, and their places kept open for them—viz.: Single men, 7s. 6d. per week; single men with dependants, 12s. 6d. per week; married men, 12s. 6d. per week, and 2s. 6d. per week for each child. This is the minimum scale adopted, and a sub-committee has been formed to increase these amounts if necessity arises.

A letter which Mr. W. J. Hadfield, surveyor of highways and deputy city surveyor of Sheffield, has written us makes it clear that the apparent disinclination of the labouring classes to respond to Lord Kitchener's "Call to Arms," noted by the contributor to our weekly feature "Things One Would Like to Know," does not extend to the employees of the Sheffield Corporation. Mr. Hadfield says: "I do not know what the experience of other corporations has been, but I would like to tell you that more than 150 of the 1,400 employees of the highway department of the Sheffield Corporation have already joined the Army, and others are joining. Many of these are married men. Nor does the highway department stand alone here. I have not the exact figures, but I know a still greater number of men have joined from the tramways department, and that large numbers have gone from the police and other departments."

Under date of Tuesday last, the hon. secretary of the Engineers' Club, Albert-square, Manchester, writes: "At an extraordinary general meeting of the club members held to-day, it was decided to form a 'Pals' Battalion for Kitchener's Army, such battalion to be recruited from those engaged in the works and offices of engineering concerns. A special committee was appointed consisting of Messrs. Daniel Adamson, H. T. Wilkinson, J. H. Stubbs, E. Simon, S. L. Pearce, G. Hughes, W. T. Anderson, E. T. Morland Johnson, E. L. Hill and Colonel Hollingworth. Every member of the club is asked to induce his friends, staff and employees to join, and to send their names as quickly as possible to me at the club. The particulars that should be given are: Name, in full; age; address; married or single; if married, number of children under sixteen years of age; occupation; name of employer; previous training, if any, in the Forces of the Crown.

WILTSHIRE MAIN ROADS.

THE QUESTION OF SUPERVISION

In THE SURVEYOR of August 21st we printed a letter signed "One of the Ten," criticising certain remarks made by Mr. J. E. Docking at the meeting of the Wilts County Council on the subject of the upkeep and supervision of the county roads. On the publication of Mr. Docking's letter, we gave herewith Mr. Docking's reply, published in the Wiltshire Times, in the hope that it may lead to a fuller and wider discussion.

SIR,—I have received letters from several district surveyors, in addition to the letter in your last week's issue signed "One of the Ten," and all complain of my statement to the county council on August 4th, and all express doubts as to my authority for saying what I did. I readily accept the challenge of "One of the Ten" to prove my assertions, and to enlighten the ratepayers as to the unsatisfactory condition of the supervision and inspection of the main roads of the county.

"One of the Ten" makes several indiscreet accusations which have no foundation. I am accused that in my remarks to the county council I made attacks on an "honourable profession," on the thirteen "district surveyors," and, through them, the ten "rural district councils," and my answer to "One of the Ten" is that his statement is untrue. What I did attack is the present wasteful and rotten system of county administration of and maintenance and control of main roads, which will be discreditable to the county council if the system—or rather want of system—be allowed to continue. I presume "One of the Ten" is standing up for what he would call his rights. I have no objection to that, but I think that a public official who threatens to expose "wanton waste" (which is not in the district of "One of the Ten" of course) should not be ashamed of his name, and hide himself behind a nom-de-plume. The gravamen I have to answer lies in the following words, which I uttered to the county council: "The county surveyor had been complaining for a long time past that the supervision of these roads was entirely inadequate, and that the supervision of the men at work upon them was a mere farce." "It appears incredible," says "One of the Ten," "that Mr. Docking could be quoting Mr. Powell's opinion." It may be incredible or a revelation, but I shall show that every word I expressed is justified by Mr. Powell's official report. In order to exculpate himself and the other nine from any imputation or fault in connection with the system I complain of, "One of the Ten" quotes the report of the county surveyor for the year ending March 31, 1913, as follows: "Taking my last annual report as a basis, I am pleased to state that there is a steady improvement in the condition of the roads in the contract districts." This is not much of a testimonial, and leaves much to be desired, and is no answer to my strictures of the present system. The county surveyor's report for the year ending March 31, 1914, which brings us twelve months nearer, and which, it seems, "One of the Ten" has not yet seen, states: "The roads in some districts are good, but in several the conditions are only fair." According to this report the "steady improvement" ended for the time with 1913, and now the roads are good in some districts and only fair in several—not much for "One of the Ten" to boast of, considering these ten part-timers cost the county council, in contributing to their salaries, £697 a year. I will now quote from a report of the county surveyor to the Roads and Bridges Committee, dated June 16, 1914, which is not intended to circulate among part-time district surveyors, to prove the statements I made are justified up to the hilt. Mr. Powell says: "In each of these ten districts the main roads are supervised or inspected by the surveyors to the respective rural district councils, who have also the charge—in some instances—of a large mileage of district roads, together with other duties (such as surveyors under the Public Health Act, Sanitary Inspector, Dairy and Cowshed Act, and Petroleum Acts) to perform." In addition to those multifarious duties, these ten part-time gentlemen have to supervise and inspect 1,621 miles of district roads, averaging 116 miles apiece, and with the fag-end of their time also supervise and inspect 660 miles of main roads for the county council, averaging another 47 miles to each man, making a total average of 163 miles of road for each surveyor. And, further, four of these surveyors have charge of the following mileage of main roads and district roads: 201, 243, 264 and 281. So that it is practically impossible for these thirteen part-time surveyors (ten of whom are not officers of the county council, and not subject to the control of the county surveyor at all, and who cost the county over £1,300 a year—to inspect the main roads oftener than once in two or three weeks. Consequently, by this happy-go-lucky arrangement, which is satisfactory to everybody but the ratepayers who have to foot the bill, the surveyors go as they please, the men on the roads do the same, some contractors follow suit, and there is an entire absence of efficient control.

I do not blame those surveyors I criticise, neither do I blame the foremen who neglect their work. I blame the muddle-headed and stupid system which perpetuates and tolerates such a condition of things. I again quote the county surveyor: "There is insufficient instruction of a detailed nature given to the men employed on the main roads in respect to the various works they have to perform. I can only attribute the neglect to the fact that the officers have not sufficient time to give that instruction." The county surveyor again states: "I have previously stated it is physically impossible, under the present system, for the surveyors of either rural contract districts or district control districts to give the personal supervision and instruction which is necessary to the men engaged at work on the main roads." Again: "There is much difficulty in getting the men to work the time for which they are paid, and to my own personal knowledge they do not work the time stated on the labour sheets." Further, the county surveyor reports: "I have taken the matter up with the surveyors of the direct-control roads on many occasions, but I regret to say without satisfactory result."

I venture to think I have made a complete answer to the challenge of "One of the Ten" to prove from official documents every word I stated to the county council, and I hope the ratepayers who do me the honour to read this letter will conclude that, in the interest of economy, efficiency, and good administration, a drastic change in main roads supervision and control is an imperative necessity. I may add that the scheme of the county surveyor is a well-thought-out and practical plan, and is the plan adopted in forty-three out of fifty-eight counties throughout the land, which will not add a single penny to the ratepayers' burdens, and is a remedy for a state of things that would be fatal to the success of any industrial enterprise.—Yours, &c.,

J. E. DOCKING.

Westbourne-gardens,
Trowbridge.
August 18, 1914.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited. *Liverpool Courier.*

Bristol City Engineer and Town Planning. In his report, covering the year ended March 25th last, Mr. Lessel S. McKenzie, ASSOC.M.INST.C.E., the city engineer, suggests that, the Local Government Board having now considerably simplified the procedure under the Town Planning Act, the Bristol Corporation might seriously consider the advisability of preparing a town planning scheme, especially in view of the necessity, which must shortly arise, of the extension of building operations.

Bituminous Materials for Road Construction.—We have been favoured with a copy of a new data form recently compiled by a special committee of the American Society of Civil Engineers on Materials for Road Construction and Standards for their Test and Use. It is the intention of the committee to distribute these forms to engineers having charge of bituminous surfaces and bituminous pavements, and it is anticipated that the accumulation of the data supplied will be of great value to the committee in connection with drafting conclusions regarding many fundamental details of construction and maintenance. The form referred to asks for a statement as to the length of work, the average width of metal, the dates of beginning and of completion and the method of construction, including information as to character and foundation, thickness of courses, kinds and quantities of road metal, and of bituminous materials used and approximate maximum grades.

SEWAGE PURIFICATION AT MANCHESTER.

RIVERS COMMITTEE'S REPORT.

The Manchester Rivers Committee have issued their report on the work of their department during the year ended March 24th last. The committee are in full control over the purification of all such effluents as the sewers of Manchester and their respective districts provide with the exception of the city sewage. This is carried out at three works, the main one at Davyhulme, the Withington works at Cheadle Hulme, the Moss Side works at Urmston (which are now connected with the treatment of town water only), and the Gorton works at Gorton.

The total income for the year in respect to the work of the committee during the year under review was £120,611. Of this amount a sum of £37,736 was required for the upkeep of the Davyhulme, Withington, Moss Side and Gorton sewage works, and for general rivers work, comprising the cleansing of the town's mill, the cost of income and various sewer improvements, and thereon to the Mersey and Irwell Joint Committee, &c. The remainder, amounting to £82,875 was applied in the payment of interest on loans, and repayment of debt in the case of city, on 30 sewage schemes throughout the whole of the city, and on the purification plant at the various sewage works.

The committee note with satisfaction that during the year there has been a further increase, as compared with previous years, in the amount of purification effected by the treatment of sewage at Davyhulme. While, as previously stated, the possibilities of nuisance arising from the canal are not increased by the discharge of the present effluent, the average effluent being the works does not meet the requirements of the Mersey and Irwell Joint Committee, nor can it be considered satisfactory. Extensions and alterations of the purification plant have, therefore, been under consideration for some considerable time, and a scheme has been prepared in outline. The details of certain portions of the scheme are receiving the active attention of the engineers, and work in connection with the alteration of the storm beds is being actually proceeded with at the present date.

ROAD WORK IN BRISTOL.

During the twelve months covered by the last annual report of the city engineer, Mr. Lessel S. McKenzie, Assoc.M.Inst.C.E., just over 141 miles of macadam roads in Bristol were tar-sprayed, with very satisfactory results, and although the number of loads of slop, &c., carted off the roads amounted to 65,076, being 3,457 in excess of the total for the preceding year, this was 17,431 loads less than the total for the year previous to the introduction of tar-spraying.

The areas of wood paving relaid have, as far as possible, been laid with deal blocks creosoted under pressure, "this class of wood paving," observes Mr. McKenzie, "being far less noisy than the Australian hard wood hitherto largely used in Bristol, and at the same time maintaining a much more even surface, and being less susceptible to expansion and contraction."

The city engineer adds that further experimental lengths of bituminous macadam have been laid, and that, although the initial cost is heavy, this method of construction, so far as can be judged at present, appears to provide a road capable of carrying present-day traffic, including motor 'buses, without serious damage to the surface. The bulk of the heavy traffic to the Royal Show ground passed over a 1 in. bituminous carpet laid in Pembroke-road, without any appreciable damage being done.

INSTITUTION OF MUNICIPAL ENGINEERS.

President Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

Meetings will be held at Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

B. WYANE,
39 Victoria-street, S.W. *Secretary.*

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr. J. S. PICKERING, M.INST.C.E., Borough Surveyor and Water Engineer, Cheltenham.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

J. W. DUDLEY ROBINSON, B.SC.(LOND.),
Secretary.
92 Victoria-street,
Westminster, S.W.

ROYAL SANITARY INSTITUTE.

YORK MEETING.

On Saturday, October 24th, at a meeting of the Royal Sanitary Institute at York, Mr. F. W. Spurr, the city engineer, will open a discussion on "The Bacterial Treatment of the York Sewage."

In the afternoon visits will be made to the pumping station at Fulford, the sewage works at Naburn, and the new Earswick model village.

The 58th course of lectures and demonstrations for sanitary officers will commence on Monday, September 21st.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

ASSISTANT SURVEYOR. September 12th. Swansea Rural District Council. £120 per annum. Mr. E. Harris, clerk, Alexandra-road, Swansea.

INSPECTOR OF NUISANCES. September 12th. Alford Urban District Council. £78 per annum.—Mr. T. N. Loy, clerk.

ASSISTANT SURVEYOR. September 12th. Devon County Council. £150—£200.—Mr. R. M. Stone, county surveyor (No. 1 Division), The Square, Barnstaple.

TEMPORARY SURVEYOR'S ASSISTANT.—September 14th.—Aylesbury Urban District Council. £75 per annum. Mr. W. Harold Taylor, engineer and surveyor.

BUILDING INSPECTOR.—September 14th.—West Ham Town Council. £150—£200 per annum.—Mr. H. W. Greaves, town clerk.

CLERK OF WORKS.—September 14th.—Aberystwyth Rural District Council. £3 3s. per week.—Mr. H. Hughes, clerk, 8 Market-street.

MOTOR FIRE-ENGINE DRIVER. September 14th.—Ossett Town Council. 30s. per week, with house and allowances.—Mr. H. Holmes, borough surveyor.

ENGINEERING ASSISTANT.—September 14th.—Watford Urban District Council. £80—£100 per annum.—Mr. D. Waterhouse, engineer.

SURVEYOR AND ENGINEER.—September 14th.—Wellingborough Urban District Council. £350 per annum.—Mr. J. T. Parker, clerk, 29 Church-street, Wellingborough.

ELECTRICAL ENGINEER.—September 15th.—Corporation of Swansea. £500 per annum.—Mr. H. L. Coath, town clerk.

DIVISIONAL SURVEYOR.—September 15th.—West Suffolk County Council. £145 per annum.—Mr. W. L. Jenkins, county surveyor, Shire Hall, Bury St. Edmunds.

BOROUGH SURVEYOR.—September 15th.—Corporation of Swansea. £500 per annum. Mr. W. Lang Coath, town clerk, Guildhall, Swansea.

INSPECTOR OF NUISANCES.—September 15th.—Matlock Bath Urban District Council. £30 per annum.—Mr. F. W. Gill, clerk.

TEMPORARY ENGINEERING ASSISTANT [illegible] Mr. C. C. Smith, Town Hall.

SURVEYING ASSISTANT [illegible] Mr. A. C. Lewis, clerk.

GENERAL FOREMAN [illegible] Mr. W. H. Cross, Council Offices.

ASSISTANT IN SURVEYOR'S OFFICE [illegible] Mr. Alan Brown, surveyor.

SURVEYOR [illegible] Mr. Lewis Owen, clerk.

INSPECTOR OF NUISANCES [illegible] Mr. M. H. Truscott, clerk, The Square, Penryn.

ST. HELENS.—October 31st. Drawings of police buildings and fire station, for the St. Helens Corporation. Premiums, £100, £50, and £25.—Mr. A. W. Bradley, borough engineer.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

HALIFAX.—September 14th.—For the erection of a [illegible] and alterations to existing buildings, for the corporation.—Mr. J. Lord, borough engineer.

EDINBURGH.—September 14th.—For the reconstruction of a tenement, for the corporation.—Mr. J. A. Williamson, Public Works Office.

ABERYSTWYTH.—September 14th.—For the construction of a covered reservoir and the laying of 6-in., 5-in., 4-in., and 3-in. cast-iron water mains, together with valves, hydrants, and other castings, and the laying of 15-in. cast-iron sea outfall, for the rural district council.—Messrs. Dodd & Dodd, County Chambers, Corporation-street, Birmingham.

CARLISLE.—September 14th.—For laying 1,200 yds. of 3-in. water main, for the rural district council.—Mr. F. Barker, 7 Victoria-place, Carlisle.

DUNDEE.—September 15th.—For the enlargement of a school, for the School Board.—Mr. J. H. Langlands, architect, 31 Murraygate, Dundee.

DEWSBURY.—September 16th.—For alterations to buildings and erection of conveniences, for the corporation.—Borough Surveyor.

MAIDSTONE.—September 16th.—For the repair of a bridge, for the rural district council.—Mr. T. A. Busbridge, surveyor.

BRADFORD.—September 16th.—For the erection of eight workmen's dwellings, for the corporation.—Mr. F. Stevens, town clerk.

EDINBURGH [illegible] of cottage, [illegible] Mr. J. A. Williamson, Public Works Office.

NEWPORT.—September 16th. For the erection of a school clinic and [illegible] street, Newport, Isle of Wight.

WAKEFIELD [illegible] Simpson & Firth, architects, Southgate Chambers, Wakefield.

BRISTOL.—September 17th.—For the erection of a school (builder's and plumber's work), for the Education Committee.—Mr. W. S. Skinner, architect, 27 Orchard-street, College-green, Bristol.

DERBYSHIRE.—September 18th. For the erection of two schools, for the Education Committee.—Mr. G. H. Widdows, architect, County Offices, St. Mary's Gate, Derby.

RHYL.—September 18th.—For the reconstruction of the amphitheatre, for the urban district council.—Mr. F. B. Smith, architect, Seacroft, Highfield Park, Rhyl.

CHESHIRE.—September 19th.—For the erection of a school at Nantwich.—Mr. H. Beswick, county architect, Newgate-street, Chester.

GLASGOW.—September 19th.—For alterations at a hospital, for the corporation.—Office of Public Works, 64 Cochrane-street.

ST. GERMANS.—September 19th.—For the erection of a bridge, for the rural district council.—Mr. H. A. Hosking, surveyor, Landrake.

CAMBRIDGE.—September 19th.—For the erection of cottages, for the corporation.—Borough Surveyor.

YORK.—September 21st. For the [illegible] weights and measures offices, for the corporation.—Mr. F. W. Spurr, city engineer, Guildhall.

COVENTRY.—September 21st.—For the construction of workmen's dwellings, for the corporation. — Mr. J. E. Swindlehurst, city engineer and surveyor.

ILFORD.—September 22nd. For the erection of a sanatorium, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

LLANFYLLIN.—September 22nd.—For the erection of eight cottages, for the rural district council.—Mr. T. Edwards, clerk.

MONMOUTH.—September 22nd.—For the erection of a school, for the Education Committee.—Mr. J. Bain, County Council Offices, Newport.

TEWKESBURY.—September 22nd.—For the erection of porter's lodge, engine-house, mortuary, and other buildings, for the Joint Hospital Board.—Mr. J. Villar, 5 Essex-place, Cheltenham.

MANCHESTER.—September 23rd.—For the erection of a valve-house, for the Gas Committee.—Mr. F. A. Price, superintendent, Gas Department, Town Hall.

KIRKCALDY.—September 26th.—For the erection of a school, for the Kirkcaldy and Dysart School Board.—Mr. W. Williamson, Royal Bank Buildings, Kirkcaldy.

SOUTH MIMMS.—September 29th.—For the erection of twelve cottages, for the rural district council.—Mr. G. Simcox, surveyor, Bearwood, Potters Bar.

CHISWICK.—September 30th.—For the construction of a brick and concrete culvert, for the urban district council.—Mr. E. Willis, surveyor, Town Hall.

COLWYN BAY.—October 8th.—For the erection of a refuse destructor, with steam boiler and auxiliary machinery complete, for the urban district council.—Mr. E. M. Lacey, consulting engineer, 12 Victoria-street, Westminster, S.W.

WARRINGTON.—October 9th.—For the erection of a school, for the Education Committee.—Mr. J. M. Murray, secretary, Education Office.

LANCASHIRE.—October 10th.—For the erection of a police station, for the Standing Joint Committee.—Mr. H. Littler, county architect, 16 Ribblesdale-place, Preston.

BOMBAY.—January 7th.—For the complete manufacture, erection and equipment of a refuse destructor for the incineration of 200 tons of refuse per day, for the municipality.—Mr. P. R. Cadell, municipal commissioner, Municipal Offices, Bombay, India.

BARNACK.—No date.—For sinking a well, laying water mains, and building engine-house, for the rural district council.—Mr. R. M. English, clerk, Stamford.

Iron and Steel.

MANCHESTER.—September 15th.—For the supply and erection of steel storage shelving, for the Tramways Committee.—Mr. J. M. McElroy, general manager, corporation tramways, 55 Piccadilly, Manchester.

MANCHESTER.—September 15th.—For the supply of 130 tons of cast-iron water pipes, for the Waterworks Committee.—Secretary, Town Hall.

Roads.

DERBYSHIRE.—September 14th.—For roadways and pathways at Walton sanatorium, for the county council.—Messrs. W. H. Ward, architects, Paradise-street, Birmingham.

BLACKBURN.—September 14th.—For making up certain streets, for the corporation.—Mr. W. Stubbs, borough engineer.

EDMONTON.—September 14th.—For the execution of private street improvement for the urban district council.—Mr. C. Brown, engineer and surveyor.

HAMBLEDON.—September 15th.—For making up a private street, for the rural district council.—Mr. S. B. Hasell, surveyor, High-street, Bramley.

LEWISHAM.—September 15th.—For making up a street, for the borough council.—The Borough Surveyor.

ILKLEY.—September 15th.—For the supply of limestone, granite, and tar-macadam, for the urban district council.—The Surveyor.

ACTON.—September 15th.—For work of widening and resurfacing, for the urban ditrict council.—The Surveyor.

LEEDS.—September 16th.—For making up certain streets, for the corporation.—Highways Department, 155 Kirkstall-road, Leeds.

NORTH RIDING.—September 19th.—For the supply of granite slag-macadam, annealed slag screenings, and slag rejects, for the county council.—Mr. W. G. Bryning, county surveyor, County Hall, Northallerton.

STEVENAGE.—September 21st.—For the supply of 800 tons of clean chippings and dust, and broken Guernsey, Leicester, or other granite, for the urban district council.—Mr. W. O. Times, clerk.

HALE.—September 21st.—For making up a street for the urban district council.—Mr. T. Blagburn, surveyor.

ANDOVER.—September 22nd.—For kerbing and paving works, for the corporation.—Mr. R. W. Knapp, borough surveyor.

ROMFORD.—September 22nd.—For works of road improvement, for the urban district council.—Mr. H. T. Ridge, surveyor.

WEST HAM.—September 22nd.—For making up Canning road, for the corporation.—Borough Engineer.

RHONDDA.—September 22nd.—For making up certain streets, for the urban district council.—Mr. E. H. Barber, engineer and surveyor, Pentre.

CROYDON.—September 24th.—For making up a certain road, for the rural district council.—Mr. R. M. Chart, surveyor.

LAMBETH.—September 24th.—For the construction of road foundations, for the borough council.—Mr. Henry Edwards, borough engineer.

RUNCORN.—September 28th.—For making up with tarred macadam certain streets and passages, for the rural district council.—Mr. R. Garnett, surveyor, Bold-street Chambers, Warrington.

GATESHEAD.—September 29th.—For paving work, for the corporation.—Mr. N. P. Pattinson, borough engineer.

CHISWICK.—September 30th.—For making up a street, for the urban district council.—Mr. E. Willis, surveyor.

TANGIER.—October 3rd.—For road construction, for the Moroccan Adjudications Commission.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

RELIEF WORKS.

IN STOCK FOR PROMPT DELIVERY:—

RANSOME CONCRETE MIXERS
RANSOME STONE DRYERS
RANSOME TAR-MACADAM MIXERS
RANSOME STEEL PILING
RANSOME PILE EXTRACTORS

Contractors to British Admiralty, War Office, India Office, Crown Agents for Colonies, &c. &c.

RANSOME-verMEHR MACHINERY CO., Ld.
509 BRUNSWICK HOUSE,
WESTMINSTER, S.W.
TELEPHONES: 2188 & 2189 VICTORIA.
TELEGRAMS & CABLES: VERMEHRICO, LONDON.

Sanitary.

COCKERMOUTH.—September 12th.—For laying 2,400 yds. of sewers and constructing manholes and flushing chambers, for the rural district council.—Mr. J. B. Watson, Greenart Villa, Cockermouth.

DOWNPATRICK.—September 12th.—For the construction of a sewer, for the rural district council.—Mr. E. L. Morrow, clerk.

ACTON.—September 15th.—For the supply of coal required for the sewage pumping works.—The Surveyor.

ARDSLEY.—September 15th.—For laying about 4,600 lin. yds. of stoneware pipe sewers and manholes, for the urban district council.—Mr. E. Brook, surveyor, Council Offices, Tingle-bank, Wakefield.

BROMSGROVE.—September 15th.—For the construction of 1,650 lin. yds. of 9-in. stoneware pipe sewers, with manholes, ventilating shafts and other works, for the rural district council.—Mr. Robert Grace, 57 Waterloo-road, Birmingham.

BOURNEMOUTH.—September 16th.—For the supply of 1,000 tons of limestone dust.—The Superintendent, Mr. F. W. Lacey, Pleasure Grounds, Bournemouth.

WELLINGTON.—September 16th.—For the construction of about 1,000 lin. yds. of pipe sewers, for the urban district council.—Mr. J. W. Littlewood, clerk.

BLYTHING.—September 19th.—For the removal of house refuse and cleansing privies, for the rural district council.—Mr. C. W. Flaxman, inspector, Holton, Halesworth, Suffolk.

BURNLEY.—September 19th.—For carting refuse from the dustbins and emptying middens, for the rural district council.—Mr. H. Pritchard, engineer.

HEMEL HEMPSTEAD.—September 21st.—For the collection of house refuse and emptying closets, for the rural district council.—Mr. T. H. Lightbody, surveyor, 20 Marlowes, Hemel Hempstead.

HARPENDEN.—September 22nd.—For the construction of about 1,000 lin. yds. of 12-in. and 9-in. pipe sewers, for the urban district council.—Mr. John H. Leverton, surveyor, Public Hall, Harpenden.

SEATON DELAVAL.—September 22nd.—For scavenging the district, for the urban district council.—The Surveyor.

WATFORD.—September 22nd.—For sewer extension, for the rural district council.—Mr. E. Lailey, engineer, 9 Market-street, Watford.

HAVANT.—September 28th.—For removing, washing, and replacing 2,000 cub. yds. of filtering material in the filter-beds, for the urban district council.—Mr. A. E. Stallard, surveyor.

BANBURY.—October 3rd.—For the construction of about 1 mile of 18-in., 15-in., and 9-in. cast-iron and stoneware pipe sewers, with manholes, storm overflow chamber, erection of engine-house, refuse destructor-house, and other works, for the corporation.—Messrs. Willcox & Raikes, Union Chambers, 63 Temple-row, Birmingham.

BISHOP AUCKLAND.—October 5th.—For the supply of disinfectants, for the rural district council.—Dr. Percival, medical officer of health, 9 Craddock-street, Bishop Auckland.

ALEXANDRIA.—December 8th.—For the construction of a sewerage system, for the municipality.—"M. le Président de la Commission Municipale d'Alexandrie," Alexandria.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

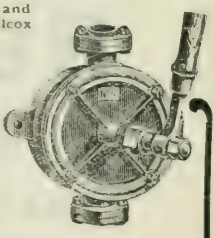
ASHFORD.—For the construction of an ejectment station with pneumatic ejectors and air-compressing plant, 240 yds. of 6-in. rising main, and a set of sewage purification works, for the West London District School Managers.—Mr. Arthur Martin, Westminster, S.W.

S. Kavanagh & Co., Surbiton Hill, S.W.	£2,480
Gore & Sons, Limited, Walton-on-Thames	2,290

WILLCOX'S PUMPS & HOSE

Our Jones-Willcox Patent Wire-Bound Hose contains NO Rubber, and, being wired internally and externally, cannot kink or deteriorate, neither can it perish like rubber hose. Jones-Willcox Hose is strongly built, stands heavy wear and tear, and is unaffected by Oils, &c.

Semi-Rotary PUMPS.



Will Lift and Force Water, Tar, &c.

In Iron and Brass.

All sizes ¾" to 4 connections.

WE STOCK STORES AND REQUISITES OF EVERY KIND.

Send for copy of our New Enlarged (736 pp.) Catalogue.

W. H. Willcox & Co., Ltd., Southwark Street, London, S.E.

"THE SURVEYOR" SECTION :: AT :: OLYMPIA

From April 13th to 25th, 1915.

Applications for space should be addressed to C. S. MASON, 24 Bride-lane, Fleet-street, E.C.

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. SEPTEMBER 18, 1914. No. 1,183.

Minutes of Proceedings.

Old Highways. The question whether an old highway is or is not repairable by the inhabitants at large is one which is sometimes very difficult to answer. This is illustrated by two cases decided by the House of Lords during the present year. One of these was concerned with Cottimore-lane, Walton-on-Thames, and the other with the Lower Sandgate-road, Folkestone (THE SURVEYOR, February 27th and March 27th last). Cottimore-lane was originally set out as a private bridleway and footpath under an inclosure award, as far back as 1804, for the use of the occupiers of certain allotments. In course of time, as was perhaps natural, these occupiers made use of the road as a cartway, and gradually it got to be used by the public generally for all purposes. It was admitted that by 1864 the road had become a public highway, but inasmuch as there was no evidence that it had ever been formally dedicated under sec. 23 of the Highway Act, 1835, it became necessary to ascertain whether the public rights had accrued before or after the passing of that Act. As to this, there appears to have been some conflict of evidence, but the Courts decided that it had not become a public highway at the time of the passing of the Act. This, of course, determined the issue on the question of fact. Two points of law, however, were raised by the plaintiff (a frontager on the road)—viz., (*a*) That, having regard to the lapse of time, formal dedication might be presumed, and (*b*) in the alternative that section 23 applied only to roads which had been originally and intentionally dedicated as public highways. In support of the first contention the case of *Leigh-on-Sea Urban District Council* v. *King* (65 J.P., 243) was cited. In that case it was held that such dedication might be presumed. But the facts were very different from those in the Walton case, the road having been substituted for an old public highway, and having, moreover, been repaired by the parish, whereas in the Walton case the road had always been repaired by the adjoining owners, and never by the highway authority. There appears to be no authority for the second contention, and at all events both these points were overruled, and the road was held not to be repairable by the inhabitants at large. It is interesting to note that this decision of the House of Lords affirmed the decisions of all the Courts below from the magistrates to the Court of Appeal.

It is not always that such unanimity is met with where a case goes to the highest tribunal, nor was it so present in the Folkestone case, to which we will now refer. The Lower Sandgate-road was constructed in the year 1824 by the then Earl of Radnor. There was a gate across the road, with a toll-box, and notice boards were affixed inscribed "Private road," and setting out particulars of the tolls which were levied on horses and vehicles, but not upon foot-passengers. These tolls, we gather, are still levied. There was no evidence that the road was required for any other purpose than for the use of the occupiers of houses which were erected on both sides of it on building plots leased by the Earl. It had, however, been used to a certain extent by other inhabitants from the year 1831. Before 1835 it had got into a bad state of repair. Afterwards it was repaired by the Earl or his lessees—never by the local authority—nor had it ever been formally dedicated. Here again the decision turned upon the question, When did the public rights accrue? And again the evidence would seem to have been conflicting, since the Court of Appeal (by a majority of two to one) held that the road had become a public highway before 1835, whereas the House of Lords came to the opposite conclusion. Obviously there must always be more or less difficulty in obtaining clear and reliable evidence as to the precise date of the commencement of public user in the case of old roads, and of course that difficulty will increase as time goes on with the inevitable passing away of the "oldest inhabitants."

*

Then and Now. In welcoming to Brussels in 1910 the Second International Road Congress, the Belgian Minister of Public Works, M. Delbeke, said: "There was nothing that was more important to the progress of the world than good roads, for as soon as roads appeared barbarism disappeared, and the conditions of life improved immediately." Well, Germany has roads, even good roads, and had them long before present methods of road making were thought of, but to-day, unhappily, few non-Germans, and certainly no Belgian, would admit that her primitive barbarism has entirely disappeared. In a similar strain to that of M. Delbeke, the Japanese delegate, Mr Inuzuka, remarked: "Since Japan had entered into the comity of civilised nations she had endeavoured, and was still endeavouring, to improve the means of communication, which was the bond of union of all peoples, but they were still far from the end of their task." Far, indeed, as regards the realisation of the idea that ready means of communication are in themselves a bond of union between nations! Moreover, the terrible irony of the present situation is still further emphasised by a statement which appeared in our correspondence column a fortnight ago to the effect that the recent bloody battle of Mons must have taken place on the very "doorstep" of a well-known Belgian quarry which is one of Belgium's principal sources of supply of road-making stones, and which was visited by the delegates to the Brussels Congress. Major W. W. Crosby and Sir George Gibb, who

[illegible] at the Congress made no reference to the aforementioned subject of road communication, but treated the [illegible] from the point of view of national welfare and internal development. Sir George Cornewall declared that "bad roads caused the loss of national prosperity." Nevertheless, the military [illegible] the [illegible] as that the discovery of the power of good roads in particular localities may conduce to the protection, possibly even to the actual preservation, of a nation's existence. On the other hand, and showing the strict impartiality of Nature and her sublime indifference even to the greatest political and moral issues, it has been stated that the continuance of the rapid and successful advance of our Russian ally towards Berlin might be [illegible] by the marshy character of much of the ground she has to traverse.

Most of the above facts and reflections may seem, perhaps, rather discouraging and disillusioning to those who, like ourselves and our readers, are earnest advocates of good roads, and in one way or another are engaged in promoting them. There can, however, be no disillusion if there has been no illusion. It is, that is, [illegible] the mistake of expecting from good roads a larger contribution to the sum of human happiness than they are at present able to make, owing to the imperfection of the race and of organised society, and especially to the absence of any authoritative international compact, such as no single nation, however powerful, shall with impunity disregard as a mere "scrap of paper." But *sursum corda!* Let us [illegible] even the most cautious thinkers say there is reason to hope—that from this cataclysmal war there will emerge a better state of things which, *inter alia*, shall give good roads the opportunity of bringing [illegible] dividends.

* * *

Water Examination.

In January, 1903, a Special Committee was appointed by the Royal Institute of Public Health to consider the methods employed in the bacteriological examination of water in temperate climates, and to draw up a scheme of uniform procedure for adoption in this examination. The value of the work accomplished by the committee is indisputable, but having regard to the very great progress that has been made in the science of bacteriology during recent years another committee was appointed in March last for the re-consideration of the whole subject. The report of this committee is now before us, and is a document of considerable importance to all the attention of all who are interested in the subject. In regard to the collection of samples, the committee, while suggesting no special precautions beyond those generally recognised, emphasise the desirability of conducting the examination as soon as possible after the sample is taken, and the necessity of packing it in ice unless this can be done within three hours. The report carefully refrains from laying down hard and fast rules as to the number and character of the tests to be employed, a matter in regard to which the bacteriologist must largely be guided by circumstances. It is pointed out, however, that in all cases the number of bacteria present in the water and the number of *bacillus coli* should be estimated. Again, the committee do not think it is practicable to lay down any fixed standards of purity to govern all cases, and merely feel justified in stating that the further a water departs from the standard of purity, "no lactose+indol+*B.Coli* in 100c.c.," the greater is the suspicion attaching to it, unless the local conditions and circumstances are such as to exclude the possibility of undesirable pollution. The report concludes with some interesting observations regarding the creation of unnecessary alarm by the wording of bacteriological reports. Any bacteriological statement must be interpreted in the light of local conditions and possible sources of contamination, and the committee are consequently well justified in their conclusion that, in the case of waters of unknown history, any statements made should be of a guarded character, and that, generally, waters should not be condemned unconditionally without accurate knowledge of all the local circumstances.

* * *

The Progress of Cremation.

It was not until the passing of the Cremation Act, 1902, that burial authorities were empowered to provide and maintain crematoria, and the number of such institutions that have since been established is exceedingly small in comparison with the importance and urgency of the sanitary reform which that measure rendered possible. The Act cannot be said to have been passed with any undue haste, for the Cremation Society of England had previously been carrying on its work, both practical and propagandist, for nearly thirty years before it was enacted. This society is the pioneer of the cremation movement, and by practically demonstrating the advantages and facilities of this method of disposing of the dead has now overcome much of the prejudice and opposition with which it was confronted in its early years. In their recently-issued report for the year 1913 the council state they fully realise that it will take time and the pressure of circumstances to compass the abandonment of a custom so old as burial, and so intimately associated with current social and religious views. It is, indeed, difficult to induce the great bulk of the community to consider the question at all, especially when persons interested [illegible] at great pains to ignore or to gloss over the insanitary and revolting conditions that prevail [illegible] at the surface in overcrowded cemeteries and graveyards. The reasons which may be urged in favour of cremation as a means of disposing of the dead are many, and range from mere considerations of economy to the avoidance of the grim possibility of being buried alive. It is well, however, that local sanitary authorities should learn to view the question from the point of view of the public health. Cremation effects in a little over an hour that which takes years to accomplish if the body is buried. The process of cremation absolutely prevents all possibility of pollution of water or contamination of air, whereas burial is always noxious and sometimes dangerous. If these facts are only brought home to the minds of the sanitary authorities, considerable further progress in the matter of cremation may be looked for in the future.

* *

A Scots Housing Practice.

Certain national weaknesses are sometimes so accentuated as to become prejudices or abuses, and among these may certainly be numbered the Scottish recess bed. This is a contrivance generally found in the kitchen of the dwelling, and it is one which even the most untutored in sanitary matters could only regard as an abomination of the worst possible type. Dr. T. Adam, medical officer of health for Stirlingshire, has, in his annual report on the operation of the Housing and Town Planning Act, rendered good service in calling attention to this objectionable feature of Scottish home life. He asserts with ample justification that the tackling of the housing problem means also getting to grips with

most forms of preventable disease, and especially with tuberculosis in its various manifestations, because the defective and insanitary house is undoubtedly one of the chief features in the perpetuation of that disease. He expresses the hope that the Housing Commission which is conducting inquiries in Scotland may see its way to make some drastic recommendations with regard to one-apartment houses, and proceeds to demand, that, so bound up have Scots architects become with the idea of recess bed in kitchen, that even in good class houses in which three-and-one-half bedrooms provision is regularly made for them "in numerous kitchens there are usually two of these alcoves, "which defy anything approaching proper ventilation." In a certain case Dr Adam protested to the architects, who replied that the recess would not necessarily be occupied by a bed, and that it was practically unavoidable. Such a defence of a reprehensible practice calls for the use of plain language, and Dr Adam certainly does not exceed the limits of courtesy when he writes "The first part seemed to him a quibble, and the second had a strong resemblance to confessed incompetence." It is to be hoped that the Housing Commission will see its way to accord to Dr Adam the strongest moral support it is capable of exercising in the effort to banish from the homes of Scotland a thing so pernicious as the recess bed, which is a defiant challenge alike to decency and sanitation.

* * *

Health and Environment.

The well known definition of life as "correspondence with environment" is capable of extended applications which possibly were not in the mind of its great originator. That the kind or character of a man's life is inevitably affected, to a greater or less degree, by his surroundings is a truth which underlies more than one familiar proverb as, for example, "You cannot touch pitch without being defiled." It is of capital importance, therefore, in the interests of public health, that the conditions of every man's labour and leisure shall be such as to increase the sum total of his life—or vitality—and not to diminish it. It is in this way, and only in this way, that an all-round national efficiency can be attained. Much of the importance of the work of a municipal engineer lies in its direct effect upon the material environment of those whom he serves. The improvement of sanitation, the removal of waste products, the provision of parks and pleasure grounds afford ready examples of this. But perhaps the greatest scope to-day is afforded in the matter of town planning. In the paper which he read at Cheltenham before the Institution of Municipal and County Engineers, and of which some extracts appear elsewhere in this issue, Mr. J. C. Midgley, the deputy town surveyor of Newcastle-on-Tyne, pointed out that the Town Planning Act is the only Public Health Act in which, by the introduction of the word "amenity," it is practically admitted that something more than good sanitation and sound construction are required in town development. Mr. Midgley emphasised the importance of *aspect*, both front and rear, as affecting the health and spirits of the dwellers in a house, and particularly the women, whose work compels them to spend the greater part of each day at home. Another matter of consequence both to residents and passers-by is that elevations should be both pleasing and varied. Matters of this kind, which may at first sight appear to be of comparatively trifling importance, must not be overlooked, as it is only by attention to these details that the full benefits of the legislation of recent years can be reaped.

Warfare and Disease.

The enormous preponderance of the casualties due to disease over those which are directly attributable to the actual operations of the enemy is a matter which attracts public attention whenever extended military operations are in progress. As in the case of other matters of preventive medicine, however, there is a tendency on the part of the public to shelve this question, except when it forces itself to the front. This observation does not of course apply to those whose business it is to deal with these questions as experts, but when it is realised that during the South African War there were twenty men who fell as victims to disease for every one killed by the enemy, it will at once be seen that in these days of the creation of huge armies in which any able-bodied man may feel called upon, if not compelled, to serve, the question of military sanitation is one of great and general public importance. It appears from Mr. Kershaw's article on "Losses from Disease During Warfare," which appears in another column, that in the Russo-Japanese war the Japanese Army succeeded in reducing the ratio to about five to two. How was this striking result achieved? The answer is that it was not due to the possession of superior scientific attainments or better apparatus, but rather to the recognition by all ranks, from the general in command to the private soldier, of the requirements of modern sanitary teaching as applied to war, and to the ready obedience to all orders issued to the army on this subject. At first sight Mr. Kershaw's suggestion that future improvement may be gained by more systematic instruction in personal and domestic hygiene in elementary schools may appear to be a little wide of the mark. In our opinion, however, it is very much in point, for we are convinced that in this, as in most other matters, too great value cannot be attached to sound training in the earliest and most impressionable years. The child who is trained to habits of sweetness and cleanliness will not readily lose them, and will inevitably apply them as far as practicable in any circumstances in which he may find himself.

* * *

The Road Question in Calcutta.

While Bombay, after a period of agitation over the treatment of the roads, has, as we gather from the *Times of India*, "settled down to the tarring process," it appears that the tale has been taken up in Calcutta, whose corporation, greatly daring, as we think, have invited an expression of opinion on the subject from various public bodies. The Bengal Chamber of Commerce, one of the authorities contributing to the symposium, are strongly on the side of tar-macadam as superior to water-bound macadam, and they recommend the continued use of tar-macadam. They point out, however, that roads recently treated with tar-macadam are much too soft, and suggest that the corporation should carry out experiments with a view to discovering a material that "will harden within a reasonable time." For roads carrying heavy traffic they advocate wood paving or asphalt. The Calcutta Trades Association and the Bengal National Chamber express substantially the same view, and the latter body think that the damage to roadside plants by percolations from the tar should be the subject of inquiry by experts. More will be heard of the matter, for we learn that the chief engineer of Calcutta has received instructions to draw up a report upon the numerous presentments received, and this will doubtless include a contribution of his own experience and practice. After all it is to the latter that we must look for the solving of a problem such as that which is peculiar to the cities of India.

Housing and Town Planning.

THE PROBLEMS OF NEWCASTLE-ON-TYNE.*

By J. C. MIDGLEY, Deputy Town Surveyor.

The fact that Newcastle is essentially commercial and industrial in character, that the price of land is excessive, and that even with increased travelling facilities the workman is practically limited to the urban districts where land is dear, renders the housing problem most difficult of solution.

As far as regards the ordinary commercial populations, the problem is more or less simple as the travelling facilities are good. The starting time for workmen is generally 6 a.m., which, if they live at any distance from their work, may mean rising at 4.30 a.m. or earlier, and not returning home before perhaps 6.30 p.m. Moreover, in the only direction in which cheap land can be found—viz., towards the north-west—railway facilities are not arranged for the artisans. The demand for house accommodation therefore is greatest in an area close to the river, where land is dear.

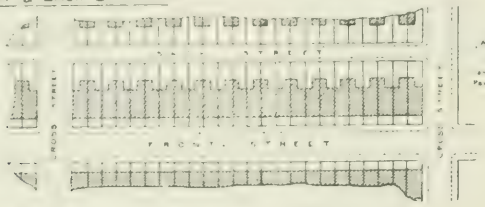
The author has made careful inquiries, and finds that the cheapest land on Tyneside appears to be about 4s. per square yard to the builder, and this does not include any street formation charges. This is the minimum price, the price rising from that figure to 10s. 6d. per yard or more, even in the immediate vicinity of the localities in which the labouring class population already live.

In the east end of Newcastle, on the Walker estate, belonging to the Newcastle Corporation, much of the land is let off at a charge of 4d. per square yard per annum for the portion built on, and 1d. per square yard for the portion not built on. For twelve houses to the acre this works out at 1s. per week for land alone, which, together with interest on paving charges, would be a serious item, even to the artisan with his 37s. per week, much more to the labourer with his 25s. per week. In these circumstances it is obvious that even twelve houses to the acre is too costly, and in the proposed town planning scheme for the eastern district of Newcastle it is not intended generally to suggest anything less than an average of from fourteen to eighteen houses to the acre over the land unit, according to the relative position of the existing houses, which have been built twenty to twenty-four to the acre, and for the most part contain two flats each. A large number of such flats have been built on Tyneside, and it is not intended to debar them altogether; but this class of dwelling is diminishing in favour. As there is still a certain demand for them, it is suggested that, where permitted, taking the two dwellings as one house, the number of houses per acre shall be less by about one-sixth than where the houses are single dwellings.

Even with these conditions the problem will remain of reducing cost in every possible direction. One way, of course, is to cheapen the land. There is no doubt that the price of land on the outskirts of large cities is largely fictitious, as a result of the crowding of houses together in small areas; but these fictitious values cannot continue. As no compensation can be claimed under the Town Planning Act on account of the limitation of the number of houses to the acre, and as no authority would think of allowing anything like the old number of houses per acre, the result will probably be that the landowners of the larger areas will have to lower prices, and that the small landowner will have to follow suit. In the end it may be an advantage to sell twice the quantity of land at a smaller price per square yard, but unfortunately this argument would not appeal to the owner of a small quantity of land.

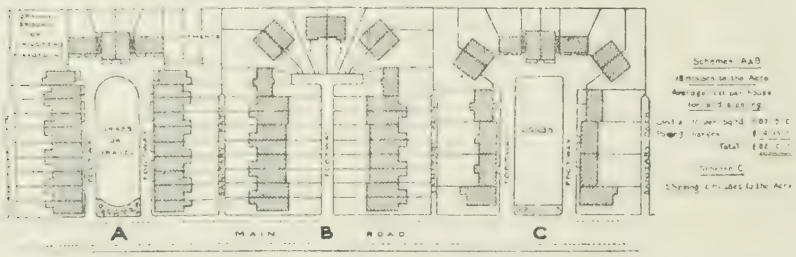
ARRANGEMENT OF TERRACE HOUSES AS LAID OUT UNDER BYE-LAWS WITH FRONT & BACK STREETS.

FIG 1



SUGGESTED ARRANGEMENT OF HOUSES IN QUADRANGLES SAVING COST IN PAVING.

FIG 2



As there are so many factors in the case, even without the question of betterment, the advisability of pooling the whole of the land under a town planning scheme may be one that is well worthy of consideration, and though hardly coming within the province of the municipal engineer, the consideration of such a scheme may be worth suggesting to any owners concerned. But even under such circumstances it is improbable that the cost of the land in industrial districts will be brought down to a figure that will allow large gardens or open spaces round each individual house.

There is the possibility of a considerable reduction in the street making charges which in the ordinary by-law streets have proved such a drawback in the past. Under the existing by-laws in Newcastle, 40-ft. front streets and 20-ft. back streets are required, and the method of street making has practically made the charges for front streets from 20s. to 25s. per foot-run per site, and those of the back streets from 10s. to 12s. This means on a 16-ft. site a charge of £24 or at 4 per cent 4½d. per week for paving only. There are miles of these grey, dismal streets in Newcastle where money has been absolutely thrown into the ground, although it is true that they preserve a better

* Extracts from paper read at the annual meeting and conference of the Institution of Municipal and County Engineers at Cheltenham.

minimum distance between the houses both back and front than might otherwise be the case.

A great saving in street charges can be made by building the houses in quadrangles, and the author has sketched suggestions for comparison with the old by-law method (Figs. 1 and 2).

The artisan does not always desire a large garden, and some much prefer some other means of recreation, and it might prove a more profitable and satisfactory method to have each individual house with only a small garden, or yard, and have the extra open space as a playground for the children, a drying ground, or a bowling green. In the Northern towns many workmen are devotees to bowling, and a bowling green at their own house door would be a greater attraction than a garden. Such an arrangement might be even a source of profit, or at least pay interest on the value of the land.

At the meeting at which Mr. Mudgley's paper was read,

Mr. H. GILBERT WHYATT (Great Grimsby) said he had been looking at the Newcastle town planning scheme plan, and it seemed to him that it was about the most practical plan for his purpose that he had seen in the various exhibitions he had attended. At the outset of his paper Mr. Mudgley had spoken of pretty plans with roads having graceful curves. That might suit some towns, but in Grimsby what they wanted were direct roads through estates whose owners were not proposing to put in any roads at all.

Mr. E. Y. HARRISON (Wellingborough) said that in his town 90 per cent. of the houses were occupied by people of the industrial class, and he should say that by far the largest proportion of them were let at rents of 5s. 9d. and under per week. There were quite a number of small areas which were in a very unsatisfactory condition; in fact, a considerable number of houses let at 3s. to 4s. per week had been condemned. The council were loth to move, because it did not seem possible for them to construct houses which could be let for less than 5s. 9d. per week and make them pay. But if the council could only wipe out these areas and provide accommodation for the people at no great expense, under the Town Planning Act, he knew they would be glad to do it.

Mr. W. J. STEELE (Newcastle-on-Tyne) said that the city which he represented, while it owed something to the general idea as a result of the carrying out of the scheme of Richard Grainger, were not among those who believed in compulsory town planning. Grainger's scheme was an example of what could be carried out without compulsion. He tackled the problem in a very practical way. Not only were the highways planned on a bold scale, but the whole of the buildings were kept to a uniform character in every street—and the result was very good. Of course, at the present day even that scheme was too small, but it showed what enterprise could do, and what the majority of owners would do if they had an example before them. The idea that owners generally were opposed to the idea of town planning was, he thought, wrong. As a matter of fact many, when the principle was explained to them, were very helpful. He did not believe they should attempt to coerce the owners; his experience had been that they would help if only they were given a proper lead. One of the great causes of delay in the past had been due to their endeavouring to come to an agreement with the owners before approaching the board; but that formality had now been dispensed with, and that would help them considerably in Newcastle. As regarded roads, that was a work that should be done logically; there was no object in laying a road that led to nowhere, and the question they had to ask themselves was where a road was going to lead to when it reached the boundary of a district. That was one of their difficulties in Newcastle. They had realised it was essential to have one long wide road from the centre of the city, but on getting to the boundary they reached one of the main roads of an adjoining authority. They wanted to know where their road was going to from that point, but the authority had not considered the question. Present-day traffic consisted largely in commercial districts of vehicles carrying 6 and 7 tons of goods, and as a great many of these vehicles made journeys of probably 30 and 40 miles, wide roads were required, not in one, but half a dozen districts, and in planning these wide arterial roads they had to consider that. When they started town planning they attempted to plan roads on the principle of connecting all outside roads with the centre of Newcastle, but, while the county council sympathised with the principle, they failed to co-operate in the matter, and the district councils, while they did not object, would not spend any money. They would like to have some control in that way, but did not think they ought to have too much bother with the owners. They had not the time to make beautiful curved roads, but their point was that in a business centre the whole thing was speed and despatch, what was wanted was to get quickly from one point to another, and that was only possible by making roads in straight lines. That was why in Newcastle they had abandoned the curved road. He did not think it was necessary in any district to limit the number of houses to the acre down to less than twelve, for the reason that if the maximum number for a particular area was twelve, and it was desired to build only four to the acre, the spirit of the Act would be fulfilled.

Mr. THOMAS ADAMS (Local Government Board), dealing with Mr. Steele's concluding observations, said he did not think it sufficient to leave the matter to chance. As to the width of roads, he considered that in many cases a 60-ft. road would be very desirable, but he should like to emphasise the necessity of having good building lines or a good set-back. One could not tell exactly what roads were likely to be required. One might be planning a large town which might not materialise for many years; therefore one ought to have sufficient forecourts to provide for altering the plans. One of the difficulties in the past had been to purchase buildings. The question had been asked whether they ought not to be allowed a deeper building line with four houses to the acre; but the Local Government Board had to decide whether the building line they fixed was reasonable for the purpose of air space. If there was to be a deeper building line it ought to be when there was a larger instead of a smaller number of houses. As to the question of industrial centres and speed of traffic, there, again, was an argument for wide roads. It was a question of congestion or interference with the free running of the vehicle, and, considering the width of road and efficiency of business, they would find a straight road was desirable. Another difficulty was that of fixing the number of houses to the acre in a district between a slum area and one covered with villas, but that could be overcome by graduating the number as they approached the two areas, increasing in one direction and decreasing in the other. His experience had shown him that people from being untidy in their mode of life had altered from the very process of changing their environment, becoming people not unwelcome as neighbours. The cottage as formerly found in their rural areas was not an untenable idea, but they must be gradual and not try to jump from the existing conditions into the ideal at once. Many of these difficulties would have to be met, and for the time they would have to sacrifice much that they might want. As to flats in back streets, personally he was a whole hogger against them. The money spent on them was wasted. The right principle was to plan towns with a view to building up a strong citizenship in our country.

Councillor VINCENT (Newcastle-on-Tyne) said that Mr. Steele had referred to the work of Mr. Grainger in their city, but he had omitted to mention the huge amount of money that great town planner had lost through his enterprise, and the equally large amount his successors had made. They had a good deal of town planning still going on in Newcastle. One scheme which they were trying to carry out was on what was known as the Walker estate. Only a small portion of that work had as yet been completed, but they were getting on as quickly as they could with the work. It would be years, however, before the ideas laid down were by any means complete. The great firm of Armstrong had opened a yard in the neighbourhood, and that had induced the corporation to utilise the estate to its best advantage. As to the question of friction between local authorities, there were not many bodies who had to contend with more of that than they had. They were barred on the south by the river; then they had round about them four local authorities with whom they had had a great deal of negotiation into which an element of jealousy had entered in some instances. Means of transit was a question that was perplexing them considerably; they wished to feel that they could go further than the boundary of their own area.

Mr. L. ROSEVEARE (South Shields) mentioned that 68 per cent of the population of his town was housed in double flats, and asked how they should negotiate with the owners if they did away with these. He

Mr. Mitchell in weighing [illegible] had been living in the centre of the city in large, [illegible] The [illegible] The problem was really always how to get the centre [illegible] As to the question of [illegible] was, of course, no objection to curved roads where necessary—as on hills. The objection to such roads [illegible] of making a nice plan. He thought back streets were very objectionable, but the houses had been kept a small distance in the rear. He objected also to [illegible] but did not see how they could do without them. At the same time, they were not so much in favour as they used to be, the little self-contained houses being more popular. Probably the question would right itself in the course of time, and he hoped they would not do a thing of the past.

ROAD-MAKING IN BRIDGE OF ALLAN.

By HARRY BLACKADDER,
Burgh Surveyor and Engineer.

During the past seven years a large amount of work has been carried through in this burgh by way of improving the condition of the various streets and roads. As mentioned in a previous article I wrote, I had to do the older method—blending the stones with soil or road scrapings—has been almost entirely abandoned.

Tarred whinstone metal, laid down in accordance with the [illegible] contained in the article published in THE SURVEYOR of January 6, 1911, continues to give excellent results. In that article I mentioned that it was my intention to resurface a street in blast furnace slag grouted with tar. Such a street was treated during the summer of the year 1911, and is [illegible] as good a condition [illegible] when it was put down.

In the summer of last year the principal or main thoroughfare was resurfaced with tarred blast furnace slag. The road in question is over a mile in length, and the average width of carriageway 24 ft., or thereabouts. The road is [illegible] known as the Great North Road, being part of the main trunk, and carrying all through traffic for the North and South of Scotland. The through traffic is exceptionally heavy, and I have always thought that in a case of this sort the Road Board ought to give very considerable assistance towards its upkeep.

The slag has stood the winter, and at the time of writing the road is looking very well indeed, and is in good order.

The author has all along been of opinion that it is a mistake in resurfacing roads to make up the finishing coat of the fine material as the latter rapidly gives way during the winter, especially after frost, when horses are often still running with studs. The surface coating should be of not less than 1½-in. material, with the interstices closed with chippings, the whole afterwards being bound with a spraying of tar.

Carefully selected blast furnace slag, when used in conjunction with tar, gives a very satisfactory wearing surface. Where, however, the foundation is in any way doubtful, the depth of tarred slag should never be less than 4 in. after consolidation, and the author usually specifies for the under coat 3½ in. of 2-in. material, and for the upper or surface coat 2 in. of 1½-in. material, which, after rolling, gives a consolidated depth of 4 in.

A Glossary of Road Terms. By H. Percy Boulnois, M.INST.C.E. St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, E.C. Price 2s.—Mr. Boulnois has achieved far more than he may imagine by this production of his pen. He set out to standardise the nomenclature of road terms; in addition he had made a valuable addition to English literature. To the untutored it is like reading a new language; Mr. Boulnois says it isn't anything like "complete." At any rate, it is a valuable *vade mecum* which no one has attempted before.—*Portsmouth Times.*

ROAD CONSTRUCTION METHODS IN NORWICH.

By ALBERT E. COLLINS, M.INST.C.E.,
City Engineer.

The [illegible] city lying between the streets of heavy traffic in the centre of the city and those of less traffic with solidly [illegible] Quarried [illegible] a thoroughly consolidated bottom, rolled to the greatest degree of compression possible, and treated with hot bitumen or hot pitch composition. Much of this solid grouted work was laid between three and four years since by contract, and that done with pitch composition has [illegible] that done with bitumen has not been so in all cases. The work of this [illegible] done by a [illegible] contractors, but I consider the unsatisfactory results to be due to their methods, and not to any defect in the bitumen, as other streets done afterward by the same contractors and with similar material have been quite satisfactory. I have had thoroughly good results with Clare's pitch composition, Mexphalte, Plascom, Roadamant, and Macgrout. I am now using the last-mentioned exclusively; it appears to offer as good results as any, and being made at the Norwich gasworks, where arrangements are in progress to deliver it to me hot, I am and shall be able to effect considerable economies as compared with the use of the other materials named.

In some cases the method has been to prepare a thoroughly solid bottom, and to lay thereon about an inch of Roadamant, which is a mixture of bitumen and granite chippings, this mixture being laid hot and floated with trowels in the same manner as ordinary asphalt is laid. The admixture of granite chips makes the cost per yard greatly less than where pure asphalt is used, and from my observation of wear for the year or so this material has been in use it appears to me it will be as durable as asphalt.

Generally speaking, the soil here is such that, if [illegible] with local gravel and thoroughly rolled, the necessary support is given to the wearing surface of the road—that is to say, it is not generally necessary to go to the expense of concrete foundations for our bituminous macadam or asphalted roads. This also applies to granite-set and wood-block paving in many parts of Norwich.

The corporation has extended bituminous macadam to the narrow streets in the older, poorer parts of the city, not so much having in view its resistance to wear, but because of the sanitary advantages of an impervious and smooth surfaced pavement. As a rule, in these streets the vehicular traffic is very slight, but the streets are largely used as playgrounds by children; hence the importance of the surfaces being such as are easily kept in a thoroughly sanitary condition.

Norwich labours under the disadvantage of having a very large mileage of main roads which radiate from the city like the spokes of a wheel, and a relatively very small rateable value, with the result that we are unable to proceed with the raising of the status of our roads as rapidly as we desire.

The Road Board has given us one grant, and has advanced a loan (free of interest) to be paid off in five years. This is enabling us to proceed somewhat faster than if we were entirely dependent upon the rates, half-year by half-year.

No new streets are now made in Norwich unless the surfaces are paved. This is generally done with tar-macadam, but where the traffic is likely to be heavy it is done with solidly grouted bituminous macadam.

At the time I write I am engaged in constructing and erecting a much enlarged plant for drying and heating stone by machinery and for mixing it with specially prepared Macgrout. My intention is to roll this down, and grout it solid with similar composition.

The difficulty I have experienced with the grouting system is that a shower of rain hinders the work, and sometimes does damage. My object in coating the stones first and then grouting is to avoid the damage done by rain during the progress of work, and to be at the same time sure that I will get a solid road instead of a road containing many cavities as sometimes happens with tar-macadam.

Whether I use bitumen or pitch composition I mix as much hot, graduated sand with the bitumen or

composition as it will flow into the spaces between the stones. This is done partly to ensure a level skeleton for filling between the stones proper of the track, and partly to encourage bitumen or pitch consolidation.

We have improved several miles of roads, but have a very large mileage to do before the work is completed in this city.

AUCHTERDERRAN, FIFE, SEWAGE WORKS.

DIFFICULTIES IN A COAL MINING DISTRICT.

The rapid development of coal mining in Fifeshire has brought with it the problem of river pollution, both by industrial processes and by the increasing of population. The works described below, which have been carried out by the Kirkcaldy District Committee of the Fife County Council, deal with the latter aspect only.

The river Ore has in its immediate neighbourhood many populous places, singly or in groups, and one of these groups, including Auchterderran, Bowhill, Cardenden and Jamphlars, was formed into the Auchterderran Special Drainage District.

Owing to the configuration of the ground, there was difficulty in bringing all the sewage to one place by gravitation. Pumping was obviously to be avoided if possible, while it was considered that the cost of management would be much less, and the efficiency much greater, with one work than with several small ones.

A further difficulty, which has had serious results in other parts of the county, was that mining developments might alter the levels. This was met, as far as possible, after consultation with the representatives of the Fife Coal Company, Limited, by placing the works on the part which is likely to sink first, and by laying the sewers with such a general direction that the lower end in each case is likely to go down sooner than the upper end. The purification works are so arranged that in the distributing apparatus there is a considerable margin for adjustment should irregular settlement take place.

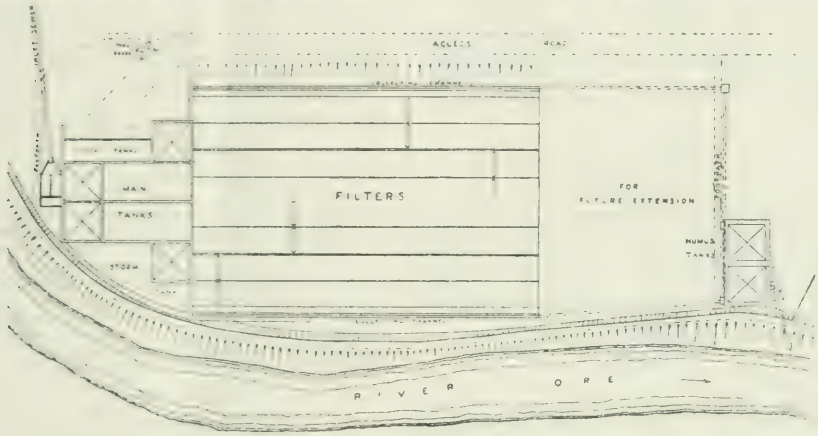
SEWERS.

Ultimately a scheme was adopted which collects the sewage and delivers it at the purification works without pumping. The main sewer is 18 in. in diameter, and follows closely the valley of the Ore, mostly on the south side, but crossing to the north a short distance above the purification works. Further up it crosses the Den Burn, while two large branches come into it from the north side of the Ore. There are thus four river crossings, each by means of a steel tube carried just above the flood level of the river. These crossings were necessary in order to get the straightest and therefore the shortest route for the main sewer, and also to avoid going against the probable direction of the coal workings.

PURIFICATION WORKS.

These are situated on the north side of the Ore, immediately above the junction of the Kirk Burn. They are well seen from the railway about a mile east of Cardenden station. The ground was comparatively flat, and no exceptional amount of earthwork was needed. The works consist of [illegible] sedimentation tanks, filters, and humus tanks, with the addition of a storm tank to deal with excessive flows. Storm overflows are, however, provided at various parts of the sewers, and these will be so adjusted that the total amount of liquid carried to the works will not exceed six times the dry-weather flow. When this maximum quantity reaches the works, about half will be diverted into the storm tank and treated by sedimentation only; but any quantity up to about three times the dry-weather flow will be passed through the ordinary tanks and filters.

The grit chambers are in duplicate; the sedimentation tanks are in two sets, each consisting of three tanks. One set or both, or parts of both, can be used at any one time. From the deep tanks the sludge is removed from time to time by opening a valve, and thereby allowing the pressure of the sewage itself to act on the sludge and force it out. It is thus delivered by gravitation a few feet only below the water level of the tanks. It can either be delivered into a sludge tank and allowed to drain, or it can be delivered into barrows and taken to the land. It is removed from the tanks without any handling. The method is an adaptation of the well-known "Dortmund" tank, and attains in a simple manner the object which is now regarded as very important—namely, the withdrawal of the solid matters as promptly as possible from the main stream of sewage. The tanks are all constructed of reinforced concrete.



AUCHTERDERRAN SEWAGE WORKS: PLAN.

The filters are rectangular in form, and the tank liquor is distributed over them by four travelling distributors of the Fiddian mono-rail type.

The filtering medium is whinstone. It is admitted that this is not quite so effective, bulk for bulk, as a material with a rougher surface, such as clinker would be, but on the other hand it is much more durable. It was considered here of more importance to produce a moderately good effluent by the use of a permanent material than to endeavour to get a very high-class effluent from a material which might cause trouble by disintegration.

The filter floor is of concrete, sloping to both sides from a central ridge. It is covered with semi-circular tiles, on which the filtering medium is laid to an average depth of about 4½ ft. in graded sizes, the largest pieces being next the tiles and the smallest layer on the top.

The filtered liquid passes to the humus tanks, which are another pair of tanks on the Dortmund principle. The liquid, after leaving the humus tanks, is discharged into the stream.

The design and supervision of the works—which were formally opened on July 29th—were in the hands of Messrs. Gilbert Thomson & Ferguson, civil engineers, Glasgow, and the contractors were Messrs. David Adamson & Co., Cowdenbeath. Mr. James Williamson acted as clerk of works. The total cost, including sewers and purification works, has been between £9,000 and £10,000.

C

Modern Methods of Road Construction and Maintenance.

WHAT MUNICIPAL ENGINEERS ARE DOING.

(Conclusion.)

In response to a request made a short time ago we have been favoured with a large number of communications from readers embodying the results of their experience with the methods of road construction which it has been necessary in recent years to introduce into their districts in consequence of changes in the character of the traffic. Instalments of these appeared in our issues of the 4th and 11th inst.; a third and concluding one is given herewith.

BELPER (RURAL).

Mr. Robert C. Cordon, Engineer and Surveyor.

This rural district, with its 102 miles of highways, many miles of which are semi-urban, has during the past fifteen years adopted a more liberal use of granite for road maintenance, in place of slag and limestone. Owing chiefly to the heavy motor traffic we have also experimented with tar-spraying and tar-grouting. The latter, although the initial expense is heavy, undoubtedly gives most satisfactory results.

BIRR (URBAN).

Mr. Henry Browne, Assoc.M.Inst.C.E., Town Surveyor.

The Birr Urban District Council, seeing the necessity for improved methods in repairing the roads in the district, last year purchased a 12-ton Aveling & Porter steam roller. We intend to steam-roll all the roads in the urban district. The council are satisfied that the system will tend to economy. I may add that I believe I am right in saying that the Birr Urban District is the smallest in Ireland who have purchased their own roller.

COLNE.

Mr. T. H. Hartley, Borough Surveyor.

In consequence of the great change in the character of the traffic of this district we have been compelled to go in for a large reconstruction scheme for our main roads, converting granite-macadam on boulder underbed to granite-sett paving on cement-concrete, and also to proceed as funds will allow with the construction of new foundations to other roads. Water-bound roads are being replaced as far as possible by tar roads in one form or another. This work, of course, entails heavy expense. No doubt after a few years the benefit of this reconstruction will, to some extent, be an economy in the cost to some extent; at least it is to be sincerely hoped for.

GRAYS.

Mr. Arthur C. James, Assoc.M.Inst.C.E., Engineer and Surveyor.

The Grays urban district lies on the main road from London to Southend and to Tilbury Docks, and the principal thoroughfares are traversed by much, and constantly increasing, heavy commercial motor traffic.

In the course of widenings and improvements carried out some years ago the opportunity was taken to strengthen foundations. The effect of this policy, and of the excellent results obtained in the treatment of road surfaces with tar and similar materials during the past ten years, has been that the new traffic has not caused so much damage as in other districts. There has not been any increase in the cost of maintenance when the expenditure upon street watering is taken into consideration.

The average cost for the three years ending 1905 was about 1½ per cent more than for the three years ending 1913, though the mileage had increased 7½ per cent in the meantime.

Up to the present coarse sand from local pits has chiefly been used for covering the tar-treated surfaces, but experience in the use of granite chippings for this purpose on small sections of road has shown this material to be so effective as to be worth the extra expense involved, and it has been decided to use it on all the principal lines of traffic this year.

Last year Fluxphalte was used instead of tar in the centre of the town, and this year its use will be considerably extended.

In new methods of surface reconstruction several experiments have been made with different materials, but so far it cannot be claimed that the results have been so completely satisfactory as to warrant their universal adoption, though, under certain conditions, they show a marked advance on water-bound macadam.

These experiments have included the use of tar and pitch (both grouted by hand and sprayed by machine on the loose macadam), several bituminous binders, hand-grouted in situ, and stone coated before being placed in position on the road.

The principal defects noted have been waviness in the surface, arising at an early stage after completion, and a tendency to crack and admit water to the sub-crust—the latter fault detroying the cohesive effect of the binder.

In repairing roads subjected to heavy, fast motor traffic, the extent to which the macadam is crushed is most noticeable, the result doubtless of the blows given to the road by the vehicles. A bituminous-bound road subject to this treatment generally consists of a number of small stones coated with bitumen on one side only, instead of each stone being thoroughly coated and bound to its neighbours.

My observations have led me to the opinion that the use of 2-in. or 1½-in. macadam must give way to the use of a much smaller aggregate in the surface of bituminous-bound roads. The sizes and proportions of this small aggregate will be a matter for experiment, the ideal at which to aim being a smooth, even surface, similar to that of asphalt, so far as this is practicable having regard to cost.

A strong foundation is, of course, essential.

KESTEVEN.

Mr. W. B. Purser, Assoc.M.Inst.C.E., County Surveyor.

So many complaints have been received as to tarred macadam in this county that we have discontinued the use of it on main roads, except for small repairs and patching during the summer months. Many of our markets are held early in the day, and especially during the winter months, owing chiefly to climatic conditions, tarred macadam roads are constantly very slippery in the early morning.

In lieu of tarred macadam we have adopted improved construction of water-bound roads. Many lengths have been put down in Ferromac, Vianex, with limestone gravel as a binder, and very good results have been obtained with each. It is found that if a properly constructed water-bound road be well made and thoroughly consolidated, and afterwards surface dressed with Tarvia, it resists motor traffic, wears well, reduces the dust nuisance, and generally gives very excellent results at a very small cost. In many cases where a road has been surface dressed for two years in succession it is found unnecessary to treat it the third year.

MALVERN.

Mr. Wm. Osborne Thorp, Surveyor.

During the past few years, owing to the large amount of motor traffic passing through this district, it has been necessary considerably to strengthen the road crusts, and long lengths of tar-macadam, pitch-grouted macadam, Ferromac, Rocmac, and Glutrin bound roads have been laid down with good results; while over 100,000 sq. yds. of water-bound macadam roads are tar-sprayed during the summer.

Owing to the enormous increase of traction traffic in parts of the district, 2½ miles of road are being entirely reconstructed to carry the heavy burden imposed upon them, the cost of this approaching £9,000. This work entails 13,350 cub. yds. of excavation, over 8,000 cub. yds. of rubble foundation, hand packed,

and 5,500 cub. yds. of 2½-in. granite, bound with Rocmac, covering an area of over 32,000 sq. yds.

The council have erected a large shed for tarmacadam work at their quarries on the Malvern Hills, but are using Clee Hill stone for main road work where subject to heavy traffic, as the local stone, though obtained very cheaply, will not bear the weights now put upon the roads satisfactorily.

NOTTINGHAMSHIRE.

Mr. E. Purnell Hooley, M.Inst.C.E.
County Surveyor.

I am afraid my opinion as to stated must be as "contested twice repeated." My council, owing to the change of traffic, commenced to use Tarmac twelve years ago, and have gradually increased its use until 70 miles of the main trunk road, as well as 25 miles of the same roads in urban districts, are now reconstructed with a centring of this material, in the manner set out in a little book of "Instructions to Workmen."

The Road Board have approved of a scheme, and are contributing to it by way of grant and loan, for a continuation of this Tarmac reconstruction work of a further 90 miles of rural and 24 miles of urban trunk roads, which will complete the work on the whole of the present most heavily trafficked roads of Notts.

It has been proved repeatedly that water consolidated materials, costing 10s. 7d. per ton, two stones thick, or 4½ in., laid length to length with Tarmac, costing 13s. 8d. per ton, last six months as against five years if constructed with about ¾ in. less thickness of Tarmac.

I do not think it is necessary for me to say more.

SUTTON, SURREY.

Mr. Wm. Hedley Grieves, Surveyor.

During the last three years the Sutton Council has spent several thousand pounds in making their main roads suitable for the changes in the character of its heavy traffic. Various kinds of material, bituminous and otherwise, have been tried.

It is highly essential in a residential district like Sutton, and within such easy reach of London, that its roads should, as far as possible, be thoroughly up to date.

I propose to give you a short statement of what we have done, commencing with the Mexphalte bituminous road we put down about twenty months ago. The length of road is about ½ mile, with an area of nearly 6,000 super. yds. The material is laid in two coats, of a total thickness of 3 in., composed of Quenast granite gauged from 1½ in. down to ½ in., excluding dust. Twenty to 25 per cent of sharp sand is added, and the whole dried and heated to a temperature of 300 deg. Fahr. After being mixed on the site with the mechanical mixer it is spread on the road at a temperature of 260 deg. Fahr., and rolled to a thickness of 2½ in. The wearing coat, consisting of ½-in. to ¾-in. granite chippings, is then laid and rolled to ½ in. in thickness. This material was laid on the main road from London to Brighton. A great portion of the road was without kerb, simply having a grass border, and without going to the expense of putting in kerb for the whole length we adopted the method of using as an abutment 4-in. by 3-in. creosoted deals, secured by iron-dogs to stakes every 10 ft. Up to the present this method has answered its purpose admirably.

We have laid also three sections of Quarrite, supplied and laid by the Northern Quarries Company, which has been down over two years. The material consists of Leicester granite mixed with special bitumen, and laid in two coats of a total thickness of 3 in., and is on the main road from Sutton to Epsom. This still presents a very good surface.

Nearly three years ago an area of 2,500 super. yds. of tarred slag macadam, supplied and laid by Constable, Hart & Co., was put down in two coats of a total thickness of 3 in., and is to-day in very good condition. This is a section of the main road first referred to, and has kerb and channel on each side.

In the business part of the main street of the town where in some places the road is very narrow, the council have laid three sections of wood-block paving, supplied and laid by the Improved Wood Pavement Company. The first section was laid in August, 1911, the second in October, 1912, and the third in November, 1912. The blocks were 7-in. by 4-in. by 3-in. deals, laid on a 7-in. bed of cement-concrete. The total area of this paving is over 5,000 super. yds.

In June, 1912, we put down a length of Roadamant (supplied and laid by the Roadamant Company, Limited) in the main street. It was laid 1 in. thick upon a water-bound macadam foundation, and consists of natural asphalt and granite chippings, heated and laid direct on the road.

Four fairly long lengths of Rocmac have been put down, the first early in 1911. This material consists of Guernsey granite, or Penlee basalt, 3 in. thick, and mixed with Rocmac solution and limestone dust. The makers claim that this material can be laid in any weather, including frost, and that it is less muddy and dusty than an ordinary macadam road, and also holds together better. There is a remarkable absence of mud on these roads, and I have had two of the sections tar-sprayed. There is no doubt that this is far in advance of ordinary water-bound macadam, which on many roads such as these with the heavy traffic they have to bear, is useless.

We have had grants from the Road Board and county council in respect to the whole of the above roads, and in the case of the bituminous roads we have maintenance guarantees for three and five years.

There is also a length of road laid with Tarvia. This has been down five or six years, and consists of a 2-in. Guernsey granite, and a ¾-in. carpet of chippings and Tarvia, finally top-dressed with the same material. This has been tar-sprayed each year.

Our side roads consist chiefly of flints obtained in the district. These roads we make a point of tar-spraying each year, with splendid results. A great saving is effected thereby, not only in watering, but in the wear and tear.

It is difficult to say which is the best form of construction, as one method will answer better in one position than another, but there is no doubt that the bituminous roads such as are now made are the roads of the future, where the cost of wood paving would prevent its general use. Otherwise, undoubtedly this (wood paving) is the road for heavy traffic.

If a carpet on a water-bound road can be laid so as to prevent water obtaining access between the foundations of the road and the carpet, owing to its being constructed cheaper, is a very effective road, and by this method the vibration caused by heavy traffic is reduced to a minimum.

A cheaper method, and probably an effective one, might be made by putting in a foundation with slag tar-macadam, and surfaced with a bituminous material.

On a hilly road where a bituminous surface might be considered unsafe the Rocmac road is a very successful one.

STRATTON (RURAL).

Mr. J. P. Baker, Surveyor.

My experience after thirty years' trial is that, in the first place, roads should not be less than 18 ft. wide. A great many roads require new ballasting, and the quarters should be strengthened, then laid with a good coat of broken stones, well consolidated, turned, and the roads kept round enough to let the water run off, seeing that the motor traffic is on the increase every year.

TRALEE (URBAN).

Mr. Oswald G. Tough, Borough Surveyor.

None of the streets and roads in my district have been constructed with a view to withstand heavy modern traffic, and all are entirely deficient of foundations. I may state that my district is, for its size, &c., the most heavily trafficked town in Ireland. Owing to the increased volume and density of the traffic, unfavourable weather conditions (the annual mean rainfall being 56 to 60 in.), and inferior stone locally available—the predominant stone being carboniferous limestone of the upper and lower series, small quantities of inferior millstone grits and flagstone being also available—I have found it impossible to maintain and keep the streets and roads in an efficient condition. The wear and attrition is very intensive, being on an average ¾ in. to ⅞ in. per year, and in some of the heavily trafficked routes 1½ in. to 2 in.

I have therefore recommended my council to adopt entire reconstruction year by year—that is, to construct adequate foundations and use bituminous-bound sub-crust and wearing crust, the wearing crust to be of hard primary or igneous rock.

With this end in view, I have recommended a continuous tarred stabilizer plant to be installed at the council's gasworks (1½ ton per hour capacity), a batch

[illegible] regard to weather conditions, machine mixing, &c.,

[illegible] oligarchy the Road Board, but up to the time of writing without result, as it is financially impossible, owing to the insufficient amount allocated and available yearly for roads, &c., to effect any permanent improvement.

I have tar-painted with crude tar some of the roads and streets, but the wear is not commensurate with the cost and trouble, for after about five months the [illegible] equally under traffic and unfavourable weather conditions. Tar-grouting is, in my opinion, cheaper and better. I reconstructed a suburban road in September, 1912, laying a 4-in. to 6-in. coating of limestone-macadam, and it is to-day the best surfaced road in my district, costing practically nothing for scavenging, and making at least 75 per cent less mud, and drying up quickly. In my opinion pitch-bound macadam, laid by intelligent workmen and under careful supervision, the aggregates being of hard rock, is the most economical road surface construction, from every point of view, for modern traffic conditions.

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain.
Each man's opinion freely is his own
Concerning anything, or anybody.
—MASSINGER: "The Fatal Dowry," Act ii., 2

THE SUPPLY OF TIMBER.

To the Editor of THE SURVEYOR.

SIR,—Architects and surveyors will be very pleased to know that the Swedish Foreign Office informed the Swedish shipowners on the 21st ultimo that, according to advices now received from the Swedish Minister in Berlin, Germany had been pleased to declare deals, battens, boards, staves and packing-case boards to be non-contraband of war.

This attitude of Germany is quite understandable, because she is extremely desirous of keeping friendly with Sweden. The result has been that many new charters have been fixed up, and shipbrokers are again trying to obtain offers. Owners are willing to risk their boats in the Baltic, the risk, of course, being from floating mines. Seven or eight boats during last week have been chartered, and altogether trade is making great efforts to get going again.

I ought to have said that the timber must be carried in neutral bottoms (*i.e.*, in neutral ships), but there is no difficulty in that.

It is still impossible to take timber from Finland, because she is Russian, so that, as some of our best joiners' deals come from Finland, the better class timbers will still be high in price, especially as there is difficulty in loading from the White Sea, on account of the shortage of labour, the conscripts having been called into active service.

At the commencement of the war Russia prohibited the exportation of timber, but she removed this prohibition very soon after it was made. The difficulty is now with the loading.

A friend of mine sent a boat out at the commencement of the war, but it was returned empty because of the prohibition. He had £12,000 worth of Archangel deals and boards on order, which would have been very profitable to him during the coming winter, but he has told me that he had since cancelled the order because of the difficulties of loading. If it could not be loaded before the White Sea had frozen (and the White Sea ports close earlier than any other timber exporting ports), he was afraid they might take fire before they could be loaded per "first open water" in the spring. There are very frequent fires in Archangel on account of the tremendous quantities of timber stocked there, and the difficulty would be for him to prove that it was not his timber that got on fire. It is a very difficult thing to prove after a fire that it is or is not your timber that has been burnt, because there are thousands of other stocks of exactly the same size all piled together.

It seems to me that the position is that we shall be able to take no Finnish and very little Archangel timber, while if timber goes very much higher during the war American spruce and cheap pitch pine will have to take the place of deal. The bright gleam of sunshine is the exportation of Swedish timber.

Since writing the above I have received information [illegible] a very reliable source stating that Finland has shipped about two-thirds of her normal output, so that the total reduction on shipments from Finnish and Swedish ports will not be a very important matter, in view of the fact that the consumption on this side during the war will also be very much less than usual.—Yours, &c.,

J. H. KERNER-GREENWOOD

King's Lynn.
September 12, 1914.

THE ROAD BOARD AND ULSTER.

To the Editor of THE SURVEYOR.

SIR,—I enclose a copy of a letter which I have sent Mr. Maybury in reply to the criticism of my recent report in THE SURVEYOR [August 21st last]. Yours, &c.,

JOHN W. LEEBODY.

Tyrone County Council,
County Surveyor's Office,
Dungannon.
September 10, 1914.

[COPY OF LETTER REFERRED TO.]

DEAR SIR,—Yours of 8th inst. to hand. I feel not a little honoured in having secured an official correction of what I know to be the feeling of many Irish county surveyors in regard to the most approachable side of the Road Board. My paper, though published now, was written last spring. The latest list of grants which I had then seen—viz., No. II.—contained only one grant to an Ulster county, and the total grants to eight counties to that date only amounted to £28,705. It is gratifying to know that in the last twelve months grants amounting to £34,295 have been made to the nine counties, and I am more than sorry that so little of it has come to Tyrone.

Would it be possible for you to publicly state—

(1) How much of this £63,000 has gone to drainage work?

(2) What total sum the county councils have agreed to provide as against this grant?

(3) What sum has been provided by the county councils of Antrim and Armagh against the £7,000 odd allocated to tar work.

I know I personally was led to believe, in conversation with members of the Advisory Committee, that applications for drainage work, *pure and simple*, had no chance of being considered, except in conjunction with resurfacing or reshaping work.

I can assure you that my references to your board are not made, or intended to be taken, in any unfriendly spirit, and the publication of your letter, with the additional information now asked for, will be welcomed by every Irish county surveyor.—Yours faithfully,

JOHN W. LEEBODY.

H. P. Maybury, Esq.,
Manager and Engineer,
The Road Board.

VACANCIES ON STAFF.

To the Editor of THE SURVEYOR.

SIR.—Owing to the volunteering by many assistants for the war, I would appeal to all chief public officials to fill any vacancies in their departments by temporary appointments only.

The municipal engineering department of almost every local authority is just now, no doubt, pretty busy owing to the development and preparation of schemes to find work for those unfortunately adversely affected by the war, and this, in addition to the shortage of staff due to volunteering, creates certain difficulties; but the patriotism of those assistants who have offered their services to their country at this crisis ought not to be a stumbling-block to their advancement on their return.—Yours, &c.,

REGINALD BROWN.

Town Hall, Southall.
September 14, 1914.

SURVEYORS AND THE ARMY.

To the Editor of THE SURVEYOR.

SIR,—Many surveyors, like myself, doubtless feel that their engineering training should be of some assistance to the Government in this time of national service, and our thoughts turn to the Royal Engineers as the branch of His Majesty's Forces where we ought to be able to use our knowledge to the best advantage. There appears to be a scarcity of officers. I would

[illegible] up a [illegible] [illegible] in the [illegible] [illegible] of the [illegible] tions, &c., necessary, and feel that a little general information [illegible] the Royal Engineers would be of service to them. Perhaps someone can give a few hints, &c.

I remain, Yours, &c., ENGINEER.

September 15, 1914.

LOSSES FROM DISEASE DURING WARFARE.

By G. BERTRAM KERSHAW, M.A.M.Soc.C.E.

It may be of interest at the present time to endeavour to obtain some statistics concerning the effects of sanitation and hygiene upon troops in time of warfare, with a view to gaining a rough idea of the relative numbers of deaths caused by disease and wounds respectively.

It may be questioned whether the man in the street realises when he sees the total death roll at the conclusion of a war how largely deaths from disease outnumber those caused by wounds received in battle. During the Boer War in South Africa (1899-1902) the British Army lost 2,000 men from disease, as against 100 killed by the enemy—i.e., a ratio of 20 to 1. In the Russo-Japanese War we find that the Japanese lost only 250 men from disease, as against 100 killed by the enemy; a ratio of 2·5 to 1.

One is naturally led to ask how was such a low mortality rate achieved?

Turning to Major Barnett's excellent handbook on "Military Sanitation for Regimental Officers" (Forster, Groom & Co., London), we find, concerning the Japanese Army, "that the comparative freedom of sickness would never have been obtained by the work of their medical department alone, however excellent, but was due to the recognition by all ranks, from the general in command to the private soldier, of the requirements of modern sanitary teaching as applied to war, and to the ready obedience to all orders issued to the army on this subject. Their admission rate to hospital for disease in comparison to wounds was, in the war with Russia as 2·5 to 1, whereas in their war with China it was as 56 to 1."

These figures make one wonder whether it would not be worth while to devote a little time to the teaching of sanitation in elementary schools throughout the country.

Strangely enough, elementary sanitation seems to be untaught in English schools, and the subject seems to be quite beneath the notice of the teachers, as being something quite unmentionable, not "genteel," while the words water-closet are mentioned with bated breath. Presumably though, intelligent teachers could be provided who are not afraid of straightforward speaking.

Possibly, if a little more attention were paid to instilling a few simple rules of sanitation and hygiene among school children, even at the expense of subjects which, in nine cases out of ten, the pupils will never be called upon to make use of, the nation would benefit in the long run.

Unfortunately, if a short "official" course were introduced to the school syllabus, it would, in all probability include such subjects as proto-biology, bacteriology, examination of drinking waters for *B. Typhosus*, &c., leaving untouched such questions as "How to dispose of your own waste products in a satisfactory manner, without nuisance to others or yourself."

To give a few more statistics from Major Barnett's book: 347 men per 1,000 died from disease in the Walcheren expedition; in Madagascar, in 1894, the French lost one-third of their men from the same cause; during the Boer War 450,000 were treated for disease, and only 22,000 for wounds, injuries and accidents combined, a ratio of over 20 to 1.

It is gratifying to learn that the benefits resulting from a knowledge of sanitation are recognised by the army authorities, and a school of army sanitation exists at Aldershot, while pamphlets on health memoranda are issued to each recruit on joining. If, however, children were taught when quite young, and when the memory is retentive and the mind impressionable, the importance of simple sanitation and hygiene, they would never forget them, and should they in after years be called upon for military service they would at all events be in possession of the elements of sanitation as a basis upon which to build further more advanced knowledge, while as civilians the early training received would be equally serviceable.

THINGS ONE WOULD LIKE TO KNOW.

(From our Correspondent.)

Is not Mr. G. Bertram Hartfree, the surveyor of Alton, Hants, to be congratulated on the publication of "The Municipal Engineer and the King's Forces," which he has contributed to this month's *Journal* of the Institution of Municipal and County Engineers? Is it not evident that Mr. Hartfree has a very considerable knowledge of military hygiene in all its practical branches—knowledge which his article should be helpful in disseminating among his brother surveyors? Is it not an article that might well have appeared in one of the "popular" magazines in order that it could be more widely read?

* * * * *

Is it not gratifying to find from Mr. Hadfield's statement in the last issue of THE SURVEYOR that 150 employees of the highways department of the Sheffield Corporation have joined the Army, and that others are joining? Who was it who said "One volunteer is worth two pressed men"? And is it not very satisfactory to think that the whole of the British Forces are composed of volunteers? Should not this fact be a strong inducement for all able-bodied men in this country to stand side by side with the gallant men who have already offered their services?

* * * * *

Should not everyone who has a penny in his pocket invest it in the purchase of Conan Doyle's splendid pamphlet "To Arms!" And when they have read it, should they not do everything in their power to assist in crushing the German tyrant who, in *his* call to arms only a few years ago, said to his soldiers: "When you come into contact with the enemy strike him down! Quarter is not to be given; prisoners are not to be made"?

* * * * *

Can it be a fact that there are still ignorant people in this country who employ the excuse for not fighting for their country that their lot under German rule would be not worse or perhaps better than it is under "party" government? And if this is really what they believe, how is this impression to be removed? Would not a study of the above-mentioned pamphlet help to remove this impression if they could be induced to read it?

* * * * *

In view of the question of unemployment and consequent distress which is at the present moment exercising our minds and pockets, is it not rather surprising to find the following statement in the last annual report recently issued by Mr. Gettings, the county surveyor of Warwickshire?—"Considerable trouble has been experienced in obtaining manual labour, and for certain classes of work we have frequently had to import men in order to get the work carried out satisfactorily." This statement, of course, refers to last year; but as such work cannot be materially affected by the war, does it not show that there is still a considerable amount of employment available for those who are able and willing to work?

* * * * *

Who was it who said "The pen is mightier than the sword"? And what would he say if he were alive now? Do not those who are carrying on a warfare against German trade argue that "the 'pound' is mightier than the sword"? Is it not evident that both these statements have a substratum of truth *at the right time*; but would not Lord Kitchener say, "The *man* behind the sword is mightier than these"? Is it not evident that the time has come for soldiers, soldiers, soldiers to bring this war to an end?

* * * * *

Was not this last question fully authorised by the speeches made at the great meeting at the London Opera House last Friday, when Mr. Winston Churchill, Mr. F. E. Smith, and Mr. Will Crookes, with one accord, pointed out that the only way to bring this terrible war to a conclusion was by pouring more and more troops from this country and from our Colonies and elsewhere into France in order to crush German militarism?

* * * * *

Is it not wonderful how successful the German Emperor has been in cementing the friendship between Great Britain and her oversea Dominions? And has not his Majesty actually done more in this direction than our politicians or statesmen, with their best efforts, have hitherto been able to accomplish? Has he had time yet to thank the Almighty for having been the instrument through which this glorious work has been achieved?

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleetstreet, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

Two weeks answers are invited to the following questions:—

417. Sewer Construction. A sewer is being constructed partly in tunnel. Describe a method of giving the levels in the heading, referring specially to the continuation of the line of levels from the surface. (Xing.)

418. Iron Curved Roof. Show details of an iron curved roof of 40-ft. span, resting on girders and stanchions on one side, and on a 14-in. brick wall on the other. The roof is to be covered with corrugated iron. Show enlarged details at the foot of the principal rafter at each end. (K. G. F., *Buckfastleigh.*)

420. Flow of Water. Assuming that the lower tank B in the accompanying diagram is full of water, and also the 9-in. pipe up to the level of 3·65, what time would it take to empty tank A if the outlet was open full bore? (A. S., *Beverley.*)

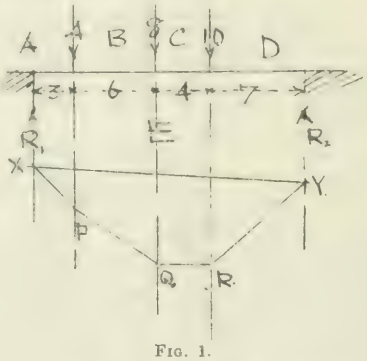


FIG. 1.

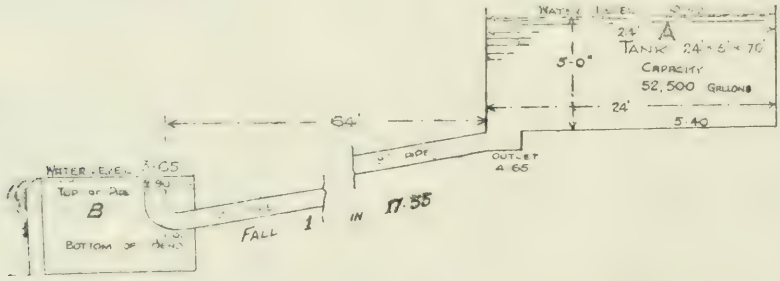

422. Building Construction.—The earth in front of a semi-basement to a house has to be supported for a depth of 6 ft. Give a section of a suitable retaining wall, and prove its stability by a graphic diagram.

423. Sewer Construction.—Show by sketches (plan and section) the junction of a 3-ft. and a 5-ft. brick barrel sewer.

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

421. Reactions of Beams.—Show how to find graphically or otherwise the pressures on the two supports of a horizontal beam which is loaded at any given points.

This can be done by calculation as follows:—

Let Fig. 1 represent the beam on two supports, and loaded with 4, 8 and 10 tons at intervals as shown. There will be certain reactions R_1 and R_2 which we are required to find.

Take moments about R_1.

$$R_2 \times 20 = 4 \times 3 + 8 \times 9 + 10 \times 13 = 12 + 72 + 130$$

$$R_2 = \frac{214}{20} = 10{\cdot}7 \text{ tons}$$

Take moments about R_2.

$$R_1 \times 20 = 4 \times 17 + 8 \times 11 + 10 \times 7 = 68 + 88 + 70$$

$$R_1 = \frac{226}{20} = 11{\cdot}3 \text{ tons}$$

It will be noticed that $R_1 + R_2 = 10{\cdot}7 + 11{\cdot}3 = 22 =$ total load.

This result can be checked graphically by means of the funicular polygon as follows:—

In Fig. 1 letter the spaces between the forces A, B, C, &c., in a clockwise direction. Draw a vertical line, and mark off *ab*, *bc*, &c., representing to some scale the magnitude and direction of the forces which come between A and B, and B and C, &c., in Fig. 1.

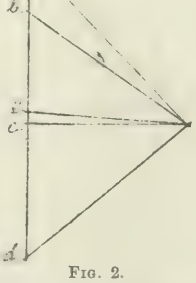

FIG. 2.

Choose a point O at some convenient distance to the right of the vertical line, join *a*, *b*, *c*, *e*, &c., to O. Produce the line of action of the forces in Fig. 1. In the space A draw XP parallel to *a*O in Fig. 2. In the space B draw PQ parallel to *b*O in Fig. 2, and so on till we reach the point Y. Now join XY (Fig. 1), and in Fig. 2 draw O parallel to XY.

*d*e and *b*a represent to scale R_1 and R_2 respectively, and on measuring are found to be 10·7 and 11·3 tons, as we found by calculation. (N. S. J., *Darlington.*)

NOTES.

(Continued from last week.)

A further example illustrating the graphical method of solution of simultaneous equations is that involving

imaginary roots, and is well exemplified from the following. This example is of further interest in that it illustrates the plotting of a rectangular hyperbola out of a parabola.

Suppose the two equations are

$$(i.) \quad \ldots = 0 \quad \ldots \quad (i.)$$

$$\frac{a^3}{\ldots} = 0 \quad \ldots \quad (ii.)$$

and we wish to find their common root or roots. Proceeding in precisely the same manner as in the other case, and exercising judgment in assigning suitable values to x, we obtain the following tabulated data:

Let $(x) = \ldots$ and $\frac{a^3}{\ldots - a}$

The common root is found from the roots of the equation

$$(\ldots) = \ldots$$

Transposing this, we get that

$$\ldots = \frac{a^3}{\ldots - a}$$

$$\ldots \ldots + \ldots - a^2 = \ldots - a^3$$

i.e., $x^3 - ax^2 - a^3 = 0$

which is a cubic equation in x, the only real root of which is $x = 1{\cdot}34a$, for, on substitution of this value for x, the left-hand side reduces to zero.

$x =$	$2a$	$\frac{3a}{2}$	a	$\frac{a}{2}$	0	$+a$	$+a$	$+\frac{3a}{2}$	$+2a$	$+3a$	$+4a$	$+\frac{5a}{4}$
$y = \ldots (x + a)$	$+2a^2$	$+\frac{3a^2}{4}$	0	$-\frac{a^2}{4}$	0	$+\frac{3a^2}{4}$	$+2a^2$	$+\frac{15a^2}{4}$	$+6a^2$	$+12a^2$	$+20a^2$	
$y = \frac{a^3}{\ldots - a}$	$-\frac{a^2}{3}$		$-\frac{a^2}{2}$	$-\frac{2a^2}{3}$	$-a^2$	$-2a^2$	Infy.	$+2a^2$	$+a^2$	$+\frac{a^2}{2}$	$+\frac{a^2}{3}$	$+4a^2$

Plotting these results, graphs of the forms shown in Fig. 2 are obtained. It will be seen from inspection that they only intersect at one point, marked D. But equation (i.) is a quadratic expression, and equation

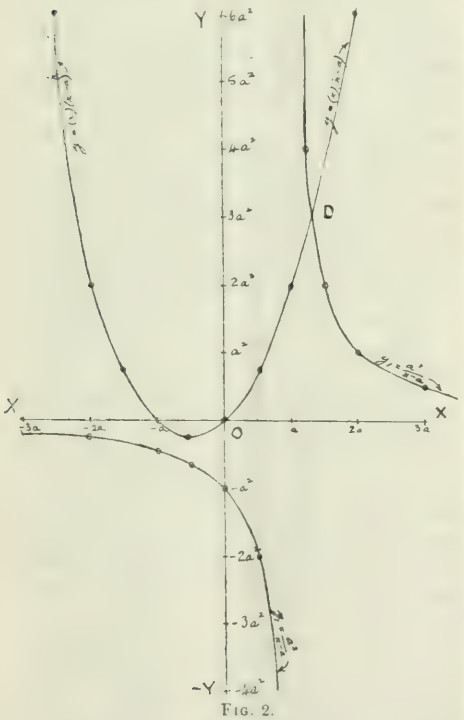

FIG. 2.

(ii.) is a cubic expression; hence we should expect three roots in the answer. But the graph clearly indicates that there is only one common value; hence the other two satisfying roots must be imaginary ... they are the roots of negative quantities. In this connection it is interesting to note that imaginary roots always go in pairs, as, for instance, in the case in point.

Reading off the value from the graph, it is clear that the real root satisfying both equations is obtained from the value of x at D, and at this point $x = 1{\cdot}34a$, and this is the required solution.

This may be proved arithmetically as follows:—

To ascertain the form of a graph from its function, the following principles should be borne in mind:—

Any expression of the form $ax + by = c$ is a straight line, and hence only two points need be plotted.

An expression of the form $ax^2 + by^2$, but no other terms of the second or higher degree, and in which a and b have the same sign but are unequal, represents an ellipse with its greatest and least axes parallel to the axes of co-ordinates.

An equation containing $x^2 + y^2$ but no other terms of the second or higher degree represents a circle if the scales of representation along both axes are the same.

The equation for a parabola having its axis parallel to the ordinate through the origin and at a distance c from it, is of the form

$$\ldots + c)^2 = 4a(y + b)$$

Now the equation of a rectangular hyperbola is of the form $ax^2 + bxy + cy^2 + dx + ey + f = 0$, provided that $a + c = 0$, and that it does not break up into factors.

Thus, $xy = k$, $x^2 - y^2 = a^2$, $6x^2 + 7xy - 6y^2 - 2x - 2y + 100 = 0$, are all rectangular hyperbolas.

A few examples in which the above curves are found in actual practice are appended.

(1) Straight Line.—The stress-strain curve of a material under tensional or compressional test, up to the elastic limit.

(2) Ellipse.—In considering the stress on any interface of an indefinitely small cube on whose opposite faces are pure normal stresses acting in opposite directions; the stress over this face is found to vary at different points, and if the magnitude of the stress at many points be plotted an ellipse will be the curve formed by joining up the extremities of the ordinates. This is known as the ellipse of stress.

(3) Parabola.—We have many illustrations of this in the bending moment diagrams of beams supported at their ends, and the load is either a distributed one or a travelling load.

(4) Hyperbola.—The most familiar example of this is the application of Boyle's Law, which states that at constant temperature any change in the pressure of the gas produces a corresponding proportional change in its volume, and *vice versâ*—*i.e.*, the product pressure by volume is constant. If a gas be experimented with, it will be found that this is so, and on plotting the result a rectangular hyperbola results.

In general, the graphical method of solution of simultaneous equations is always applicable, whereas their solution algebraically often presents very great if not insuperable difficulties. (T. W. P., *Bexhill-on-Sea.*)

Metropolitan Water Board Bills.—The Metropolitan Water Board's offer of £1,000,000 of money bills was subscribed for more than five times over at the Bank of England on Monday, the 14th instant, and the board had the satisfaction of raising the money at an average rate of £3 3s. 1d.

PRO PATRIA.

[SECOND LIST.]

In our issue of August 28th we commenced the compilation of a "Honours" list of municipal, county and sanitary officials who are taking part in the present war. A most gratifying response was made to our request that readers should assist by notifying us of cases within their knowledge, the number of communications which have reached us being in fact so great that the publication of a second list has now become necessary.

Bass, P., Middlesex County Council staff, with the East Surrey Regiment.

Bass, T., Middlesex County Council staff, with the 1st Surrey Rifles.

Beaumont, W. R. L., engineering assistant, Corporation of Birmingham, with the Warwickshire Yeomanry.

Bird, Walter Cyril, junior assistant in surveyor's department, Kettering Urban District Council, with the 6th (Service) Battalion Northamptonshire Regiment.

Blackwall, J. E., B.A., ASSOC.M.INST.C.E., county surveyor of Cambridge, Captain, with the 6th Battalion Notts and Derby Regiment.

Blake, F., clerk, sewage disposal works, Kingston-upon-Thames, has joined the colours.

Bolter, S., Middlesex County Council staff, with the Army Service Corps.

Bristol, O. H., Middlesex County Council staff, with the Westminster Dragoons.

Broom, H., Middlesex County Council staff, with the Queen's Westminster Rifles.

Burchell, H. W., Middlesex County Council staff, with the Queen's Westminster Rifles.

Buscombe, R. T., borough surveyor of Bodmin, with the Territorials.

Bushby, P., clerk in the office of the city engineer and surveyor of Brimingham (Mr. Henry E. Stilgoe, M.INST.C.E.), private, Warwickshire Yeomanry (Territorials).

Catton, Percy, assistant surveyor of Grays, who is a corporal in the 3rd Essex (Grays) Battery of the R.F.A., has, with the whole battery, volunteered and been accepted for foreign service. The battery two years ago won the King's Prize for shooting at Okehampton.

Chandler, E. R., clerk, Corporation of Birmingham, with Lord Kitchener's Army.

Chandler, G. W., engineering assistant, Corporation of Birmingham, with the Gloucestershire Yeomanry.

Cornock, Edward, second assistant engineer of Clydebank, has been called to the colours of the Royal Engineers.

Cossins, G. H., Middlesex County Council staff, with the Westminster Dragoons.

Crone, J. S., Middlesex County Council staff, with the London Scottish.

Davies, Dr. S. J., Middlesex County Council staff, with the Royal Army Medical Corps.

Davis, R. P., engineering assistant, Corporation of Birmingham, with the London Rifle Brigade, 5th City of London Regiment.

Dickinson, C., Middlesex County Council staff, with the 1st Surrey Rifles.

Dowling, F., second clerk, municipal stores department, Kingston-upon-Thames, has joined the colours.

Downer, J., Middlesex County Council staff, with the 1st Surrey Rifles.

Downing, A. N., clerk in the office of the city engineer and surveyor of Birmingham (Mr. Henry E. Stilgoe, M.INST.C.E.), with the 6th Battalion Royal Warwickshire Regiment.

Drake, P., Middlesex County Council staff, with the 1st Surrey Rifles.

Eckersall, P. G., engineering assistant, Corporation of Birmingham, with Lord Kitchener's Army.

Eversett, W. J., inspector of nuisances, Congleton, has volunteered for service abroad, and has joined the 2nd London Sanitary Company.

Farrington, W. P., draughtsman and assistant in the office of the borough engineer and surveyor of St. Pancras (Mr. W. Nisbet Blair, M.INST.C.E.), has joined the colours of the 7th County of London Fusiliers.

Firman, W. H., surveyor's department, Teddington Urban District Council.

Fitch, J. T., engineering assistant, Corporation of Birmingham, with Lord Kitchener's Army.

Hall, B., Middlesex County Council staff, with the Honourable Artillery Company.

Harland, A. E., clerk, Corporation of Birmingham, with Lord Kitchener's Army.

Harman, R. W., clerk in the office of the borough engineer and surveyor of St. Pancras (Mr. W. Nisbet Blair, M.INST.C.E.), is serving with the Queen's Westminster Rifles.

Hawkes, F., Middlesex County Council staff, with the Queen's Westminster Rifles.

Helliwell, R., Middlesex County Council staff, with the 13th County of London.

Hobbs, A. T., engineering assistant, Corporation of Birmingham, with the 6th Battalion Royal Warwickshire Regiment.

Howell, A. P., engineering assistant, Corporation of Birmingham, with Lord Kitchener's Army.

Hunter, ——, sanitary inspector to the Maldens and Coombe Urban District Council, is on service as Captain.

James, R., messenger in the office of the city engineer and surveyor of Birmingham (Mr. Henry E. Stilgoe, M.INST.C.E.), Sergeant with the 6th Battalion Royal Warwickshire Regiment (Territorials).

Jukes, R. J., engineering assistant, Corporation of Birmingham with the 6th Battalion Royal Warwickshire Regiment.

Kewin, W., Middlesex County Council staff, with the City of London Roughriders.

King, F. B., Middlesex County Council staff, with the Queen's Westminster Rifles.

King, J. S., engineering assistant, Corporation of Birmingham, with Lord Kitchener's Army.

Landen, G., second clerk to the borough surveyor of Kingston-upon-Thames (Mr. R. Hampton Clucas), has joined the colours.

Lander, R. C., Middlesex County Council staff, with the 2nd City of London Regiment.

Lovelock, H. W., assistant surveyor to the Godstone Rural District Council, has enlisted in the County of London Rifle Brigade for home or foreign service.

Lower, H. C., inspector of nuisances to the Rye Rural District Council, has joined the Army.

Lunn, H. E., second assistant to the borough engineer of Tunbridge Wells (Mr. W. H. Maxwell, ASSOC.M.INST.C.E.), has joined Lord Kitchener's Army, to be attached to the 7th Battalion of the Royal West Kent Regiment.

Lyles, C., assistant in collector's department, Kettering Urban District Council, with the 6th (Service) Battalion Northamptonshire Regiment.

Mackenzie, R., clerk in the office of the city engineer and surveyor of Birmingham (Mr. Henry E. Stilgoe, M.INST.C.E.), Sergeant, Royal Engineers (Territorials).

Mathew, H. B., engineering assistant, Corporation of Birmingham, with the 5th Buffs (Kent).

Moir, H. W., Middlesex County Council staff, with the Royal Army Medical Corps.

Moore, F. A., engineering assistant, Corporation of Birmingham, with Lord Kitchener's Army.

Morrison, Peter, second assistant sanitary inspector of Clydebank, is serving with the Royal Engineers.

Murray, H. A., Middlesex County Council staff, with the Royal Army Medical Corps.

Nash, F. O. C., chief assistant, Birmingham Town Planning Department, Captain, 5th Battalion Northumberland Fusiliers (Territorials).

Neville, J. W., Middlesex County Council staff, with The Buffs.

Nicholson, W. A., surveyor to the Halstead Urban District Council, Essex, with the 8th Essex Cyclist Battalion. The battalion has volunteered for foreign service.

Noden, F. W., assistant building inspector, Corporation of Birmingham, with Lord Kitchener's Army.

Oakes, R., Middlesex County Council staff, with the Queen's Westminster Rifles.

Palmer, J. C., assistant sanitary inspector, Kettering Urban District Council, has joined Kitchener's Army.

Parker, H. J., surveyor to the Kettering Rural District Council, with the 6th (Service) Battalion Northamptonshire Regiment.

Perkins, H., assistant, Corporation of Birmingham, with Lord Kitchener's Army.

Perry, F., Middlesex County Council staff, with the 6th City of London.

Pickmere, J. R., engineering assistant, Corporation of Birmingham, with Lord Kitchener's Army.

The Surveyor
And Municipal and County Engineer.

Radford, F. M., engineering assistant, Corporation of Birmingham, with Lord Kitchener's Army.

Radford, H. S., Middlesex County Council staff, with the Honourable Artillery Company.

Robinson, R. A., Middlesex County Council staff, with the Honourable Artillery Company.

Rothwell, L. A., Middlesex County Council staff, with the Queen's Westminster Rifles.

Sedgwick, G., Middlesex County Council staff, with the Naval Volunteer Reserve.

Slatcher, W., Middlesex County Council staff, with the 13th County of London.

Smith, A. G., clerk, Corporation of Birmingham, with Lord Kitchener's Army.

Smith, C., Middlesex County Council staff, with the Royal Marine Reserves.

Spurgeon, H., Middlesex County Council staff, with the 13th County of London.

Thompson, A. C., ASSOC.M.INST.C.E., chief assistant to the borough engineer of Tunbridge Wells (Mr. W. H. Maxwell, ASSOC.M.INST.C.E.), has joined Lord Kitchener's Army, to be attached to the 7th Battalion of the Royal West Kent Regiment.

Thorn, R. F., pupil of the borough engineer and surveyor, Maldon (Mr. T. R. Swales, M.INST.C.E.I.), with the Essex Yeomanry; has volunteered for foreign service.

Toll, S., Middlesex County Council staff, with the Queen's Westminster Rifles.

Tozer, A., engineering assistant, Birmingham Corporation, Sergeant, Warwickshire Yeomanry (Territorials).

Tuffin, A. E., surveyor's department, Teddington Urban District Council.

Wallis, S., sanitary inspector to the Kettering Rural District Council, with the Northamptonshire Imperial Yeomanry.

Waters, B., clerk in the office of the city engineer and surveyor of Birmingham (Mr. Henry E. Stilgoe, M.INST.C.E.), with the 5th Battalion South Staffs Regiment.

Weston, C. F. R. N., chief assistant, Birmingham Special Works Department, Captain, Royal Engineers (Territorials).

Whitaker, John, articled pupil to the borough engineer of Accrington (Mr. W. J. Newton, ASSOC.M.INST.C.E.), has joined the 8th Manchester Territorials, and volunteered for foreign service.

Wiltshire, E., Middlesex County Council staff, with the Queen's Westminster Rifles.

THE WAR.

AUTOMOBILE ASSOCIATION MEMBERS AND WAR SERVICES.

The magnificent response by the members of the Automobile Association to the recent appeal for cars and motor cycles has enabled the association to play a very important part in the work of assisting the authorities. The numerous military duties undertaken have been of a varied description, from taking generals to the different military centres to carrying inspectors on observation in connection with bridges and sentry posts; also the appointment of members with their cars for permanent duty at the various commands. Various recruiting depots around London have been supplied with cars. Recruiting tours comprising batches of cars are at work in different parts of the country. In London and other centres members' cars are being used for collecting recruits and bringing them to the stations. Cars have been provided for officers superintending the shipment of aeroplanes, &c. Other useful work includes assisting refugees, the Navy League, the National Service League and Red Cross work. On occasions fleets of fifty cars have been in attendance at given stations in connection with Red Cross work. Other organisations which have received assistance are the Local Government Board, Central Committee Women's Employment, Y.M.C.A., and the Prince of Wales' Fund. Motorists who are willing to convert their cars into ambulance vehicles at a reasonable cost are earnestly requested to communicate with the Secretary, Automobile Association and Motor Union, Fanum House, Whitcomb-street, London, W.

LOCAL AUTHORITIES AND THE WAR.

The Lord Mayor of Birmingham (Lieut.-Col. Ernest Martineau), commanding 6th Battalion Royal Warwickshire Regiment (Territorials), has gone on active service.

The city electrical engineer of Belfast reports that up to the present twenty-three of his staff have joined the colours, and that he is having the vacancies temporarily filled.

The assistant surveyor to the Royton (Lancs) Urban District Council, who is an officer in a Manchester regiment, has joined the colours, and it has been decided to keep his position open for him.

Gateshead Corporation have agreed that in the case of married employees on service the amount received from the Government shall be augmented to the amount they were receiving before being called out.

Taunton Town Council have agreed to the payment of such amounts to wives of married men as will bring their income up to the wages received by such men, and to single men a half-pay allowance during the war.

The Frome Urban District Council have resolved to pay to all employees who have gone to the front the difference between the Army pay, separation and other allowances, and the average wage which the employees were in receipt of before enlistment.

At a meeting recently of the Easington Rural District Council, the clerk, in reply to a member, said both the two surveyors (Messrs. G. Waterhouse and J. G. Heslop) and himself would be perfectly willing, if the age limit permitted, either to enlist or offer their services for any purpose required.

Bexhill Town Council have resolved to keep open the situations of those employees who have been called to the colours. The men will be paid such sums as, with the Government pay, will amount to full wages, except in cases where the wages exceeded £2 a week, for which special consideration will be made.

Many of the outdoor employees of the Middlesex County Council have joined different regiments. The council are keeping the positions of both the staff and employees open until they return, and are paying their full salaries and wages, less the amount each one receives from the War Office or the Admiralty, as the case may be.

At Tavistock Urban District Council on Saturday, Mr. F. Camble, surveyor, asked permission to join the Territorial Force for ambulance work, but as there are important works in hand which only Mr. Camble thoroughly understands it was felt that the preservation of the public health was of the highest importance, as the Local Government Board had recently pointed out to the council. It was resolved that, while

[illegible] Mr. L. A. Dibdin and Mr. H. A. J. Dibdin have volunteered for foreign service.

Mr. H. Cecil Foster, engineer and a director of the Essex Steam Rolling Association, Limited, 18, 19 and 20 Coval Chambers, Southend-on-Sea, has joined the Seaforth Highlanders (Territorials).

Several of the employees of Messrs. Adams-Hydraulics, Limited, have been accepted for active service, among those being Mr. D. Hutton, their local representative, who already holds the South African medal with six clasps, who has again volunteered.

The Reinforced Rar and Concrete Engineering Company, Limited, Queen Anne's Chambers, Westminster, S.W., inform us that, in spite of the fact that they have, like other firms in this country, temporarily lost the services of some of their staff, who have joined the colours, they are sufficiently organised to cope with work which may be placed with them as in normal times. They naturally desire to keep their staff fully employed without entailing upon them any financial sacrifices, and they therefore venture to ask customers to co-operate with them by proceeding immediately with any reinforced-concrete work they have on hand, and by placing any further inquiries with them. The company state that the whole of their staff is British, their business has been founded and [illegible] with British capital, of which not a single share is held by a foreigner, and the steel they sell has always been, without exception, British material and of British manufacture, and will continue to be so.

RUISLIP-NORTHWOOD TOWN-PLANNING SCHEME.

At the council meeting of the Ruislip-Northwood Urban District Council on Monday, September 14th, the approval of Parliament and the Local Government Board was received for their town planning scheme of some 6,000 acres in extent.

This terminates an enormous amount of time and labour which has been given to the scheme over a period of no less than 3½ years, and the congratulations of other authorities will be extended to the council and their officials on having successfully carried through the first urban district town planning scheme in England.

Timber in Water Main.—The cleansing of an 18-in. [illegible] belonging to the Airdrie, Coatbridge and District Water Trust resulted in the discovery of two pieces of wood, one 9 ft. and the other 11 ft. in length, in a section of the pipe.

A Grimsby Competition. The Grimsby Board of Guardians recently invited competitive designs from architects for the new receiving Home for Children at the workhouse. From the designs submitted to them for their inspection they have selected that of Mr. T. Waddingham, architect and surveyor, 89 Cleethorpe-road, who has accordingly been instructed to carry out the work for them. Mr. Waddingham is an old pupil of the borough surveyor's department. He resigned the position of surveyor to the Hebden Bridge Urban District Council in June last, in order to take up private practice at Grimsby.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Abercarn U.D.C. (September 8th. Mr. A. G. Drury).—£1,376 for the purchase and laying out of the Distillery Field as a recreation ground. It was stated that one of the objects of the council was to provide work to prevent distress, and that the scheme would be proceeded with forthwith.

Clay Cross U.D.C. (August 26th. Mr. W. M. Cross).—£400 for the purpose of water supply, including the execution of works in the township of Ashover. It was explained that some 16,000 gallons a day was running to waste from the Press Brook, and it was desirable that this should be secured for the use of the town, while it was thought that an even more productive supply could be obtained. It was also thought advisable to have increased storage capacity by erecting a tank or reservoir at the highest point of Clay Cross, to hold one day's supply.

Hinckley U.D.C. (September 9th. Mr. W. M. Cross).—£1,065 for the construction of a new pumping main at the Sketchley sewage disposal works. The surveyor, Mr. E. H. Crump, stated that the new main would pump 3,000 gallons per minute instead of 140 as at present.

Rotherham T.C. (September 9th. Mr. F. O. Stanbrook).—£6,940 for the extension of the main sewer from Effingham-square to the outfall works at Aldwarke, and £700 for the purchase of a motor wagon.—The borough engineer, Mr. E. B. Martin, stated that the main sewer extension was rendered necessary owing to the very rapid growth of the population.

Southampton T.C. (August 24th. Mr. W. H. Collins).—£11,923 for the purchase of land for the erection of working-class dwellings under Part III. of the Housing of the Working Classes Act, 1890.—It was explained that the council contemplated the erection of 552 houses, approximately. The town clerk, Mr. R. R. Linthorne, stated that it was hoped to let the houses at economic rents, but he thought something would have to be borne by the rates.—(August 25th. Mr. R. G. Hetherington).—£36,500 for works of water supply, including the construction of a reservoir in Glen Eyre-road, Bassett, and the execution of certain other works there and at Otterbourne. The waterworks engineer, Mr. E. C. Rodda, stated that the daily demand varied from 3,500,000 to 4,000,000 gallons, and the reservoir capacity was barely sufficient to meet this.

Torquay T.C. (September 8th. Mr. H. Shelford Bidwell).—£16,000 for the electricity undertaking, £5,990 for the pavilion, and £500 for electrically illuminating the Princess Gardens.—Mr. C. W. Salt, borough electrical engineer, said a portion of the electricity plant was required at once, and that it was necessary that the new generating plant should be installed before the winter of 1915. With respect to the pavilion, Mr. H. A. Garrett, borough surveyor and architect of the pavilion, explained that the additional expenditure was in order to increase the general attractiveness and earning power of the building. Of the items, one of over £700 was for the glazed ornamental screen between the concert hall and café, and another was for £127 for the outside iron staircase leading to the roof overlooking the Princess Gardens.

APPLICATIONS FOR LOANS.

Bollington U.D.C.—£350 for improving the recreation ground.

Burnham (Somerset) U.D.C.—£2,900 for a sewerage scheme, and £485 for the purchase of part of the Berrow Water Company's undertaking.

Croydon T.C.—£1,800 for surface-water drainage.

Esher and the Dittons U.D.C.—£1,250 for private street improvement.

Harrogate T.C.—£762 for street works.

Hipperholme U.D.C.—£1,500 for road improvement.

Holywell R.D.C.—£13,500 for the erection of fifty-two workmen's houses.

Newport (Mon.) T.C. £[illegible] for the development of the Scing-on estate and the erection of 100 houses.

Ramsgate T.C. £[illegible] for the extension of the East Cliff bathing station, and £1,665 for wood paving.

Scarborough T.C. £10,000 for the construction of a bathing pool at the beach bungalows.

Tottenham U.D.C. £[illegible] for replacing obsolete [illegible].

Westbury U.D.C. £[illegible] for the erection of [illegible] workmen's dwellings.

Westhoughton U.D.C. £2,000 for sanitary conveniences.

Whiston R.D.C. £6,000 for sewage disposal works.

Wokingham T.C. £1,600 for a housing scheme.

Worcestershire C.C. £10,000 for new offices.

LOANS SANCTIONED.

Ashton-under-Lyne T.C. £11,000 for the sewage disposal works.

Ashton-under-Lyne.—£426 for alterations to a school.

Barrow-in-Furness T.C. £650 for a public convenience.

Boston R.D.C. £8,340 for a housing scheme.

Bourne U.D.C. £11,230 for the purchase of the coal gas undertaking.

Brierley Hill U.D.C.—£6,600 for the purchase of land for a cemetery.

Chingford U.D.C. £1,350 for road improvements.

Croydon T.C. £19,743 for the construction of the Thornton Heath-Purley relief road.

Dartford U.D.C.—£1,350 for a cemetery chapel.

Derby T.C.—£12,240 for a recreation ground.

East Stow R.D.C.—£1,739 for works of water supply.

Epsom R.D.C.—£850 for private street improvements.

Esher and the Dittons U.D.C.—£580 for Ember Court-road sewer (for thirty years).

Fermoy U.D.C.—£4,580 for a housing scheme.

Ilford U.D.C.—£8,550 for main road improvement, and £4,600 for sewage disposal works.

Holsworthy U.D.C.—£1,400 for the erection of workmen's dwellings.

Hull T.C.—£14,448 for a tuberculosis hospital.

Jarrow T.C. £5,000 for road improvements.

Lathom U.D.C.—£800 for works of water supply.

Lymington T.C.—£1,845, further loan for works of sewerage.

Maldens and Coombe U.D.C.—£2,450 for the provision of a refuse destructor. The sanction granted in 1913 for a loan of £1,600 for the same purpose has been cancelled.

Penzance T.C.—£256 for public conveniences.

Rhyl U.D.C.—£3,777 for dredging works, £231 for pumping station buildings, and £168 for new sewering machinery.

Riccall R.D.C. £3,510 for a water supply for Barlby.

Sutton (Surrey) U.D.C.—£1,778 for the Rose Hill improvement.

Thames Ditton U.D.C.—£850 for works of sewerage.

Torrington T.C.—£11,000 for the erection of workmen's dwellings.

Warminster R.D.C.—£1,834 for a housing scheme.

Warrington T.C.—£1,060 for road widening.

Woking U.D.C. £18,000 for improvements at the sewage works.

Association of Managers of Sewage Disposal Works.—The meeting of this body which it had been arranged to hold at Burton on the 26th inst. has been postponed until next year.

The Destruction of Insects: "Pax."—"Kill that fly" is an injunction to which in recent years we have grown fairly accustomed, but a considerably more efficacious method of ridding ourselves not only of flies, but of other even more objectionable insects would seem to be provided by the discovery of a compound which is claimed to render not only human beings, but animals and vegetation immune from the attacks of these pests. The preparation is known by the name of "Pax," and already, we understand, it is being employed on an extensive scale by a number of public authorities. Experiments have demonstrated that when it is sprayed on to refuse of any kind the result is an immediate disappearance of all forms of insect life, a fact which at once suggests that its adoption on sewage farms and destructor works would be likely to do much in the direction of removing a nuisance that is only too frequently a cause for complaint on the part of those living in the vicinity of such undertakings. Flies are stated never to be found in rooms where it is used; insects that come in actual contact with it drop dead instantly; but it is quite harmless to human beings, as evidence of which it may be mentioned that one of the forms in which it is obtainable admits of its use in the bath as a preventive of stings and bites. "Pax" 14 Caxton House, Westminster, S.W., will gladly supply full particulars on application.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important proposals details of which particulars appear below:—Belfast—Derby £3,050; Rhyl £4,000; St. Anne's-on-Sea, Scarborough £10,000; housing and town planning—Ilford, Margate £9,470; roads and materials—Belfast £8,194, Croydon £60,131, Norfolk, Swansea, Tottenham £15,457; sewerage and sewage disposal—Bulkington £8,500; water, gas and electricity—Poole £20,000. Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Derby T.C.—The London-road recreation ground is to be laid out at an estimated cost of £3,000, and it has also been agreed to proceed with the construction of cattle market at the Spot, at an estimated cost of £3,050.

Kingsbridge U.D.C.—The council last week decided to proceed with the erection of the walls and entrance to the new cattle market, and also to sink a well.

Lytham U.D.C.—The surveyor, Mr. A. J. Price, has received instructions to prepare a rough sketch and estimate for a bathing pool on the foreshore.

Malton R.D.C.—A plot of land has been purchased for the construction of a reservoir at High Hutton.

Newcastle-upon-Tyne T.C.—The Estate and Property Committee have accepted the tender of Mr. S. F. Davidson, of Newcastle, for the erection of baths at Benwell, Heaton and Walker.

Rhyl U.D.C.—The council have accepted the tender of Mr. A. Torkington, Rhyl, at £596, for the erection of the new administrative block at the isolation hospital.—The council have forwarded to the Local Government Board a scheme for a new amphitheatre to cost £4,000, and are now considering plans for the new pier scheme and the laying out of a portion of the sea front in marine gardens.

St. Anne's U.D.C.—The council have adopted a scheme for sea-water baths estimated to cost £6,500.

Scarborough T.C.—The Public Parks and Entertainments Committee have been authorised to proceed with the construction of a bathing pool at the south side of Peasholm slipway, abutting on the Royal Albert-drive, in the North Bay, at an estimated cost of £10,000. The scheme includes the erection of six more beach bungalows and bathing pavilions on the cliff side, immediately opposite the site of the bathing pool.

Yarmouth T.C.—The Baths Committee recommend the construction of an open-air bath on a site to the east of the Aquarium, at an estimated cost of £3,500.

HOUSING AND TOWN PLANNING.

Barry T.C.—It has been agreed to purchase land for the purpose of building twelve workmen's dwellings.

Caerphilly U.D.C.—The purchase has been completed of land on the Grange estate for a housing scheme.

Evesham T.C.—A resolution has been adopted to build fifty-two houses, and Mr. H. E. Dicks, of Evesham, has been appointed architect. The dwellings will be planned mainly upon the model of those erected by the Evesham Rural District Council at Broadway and Offenham.

Greenock T.C.—The commissioners of the Local Government Board, who inquired into the local housing conditions, recommend the corporation to proceed with the erection of 250 houses, and with a similar scheme a year hence, the class of house to be determined by arrangement between the board and the corporation. The report is, in the meantime, for the observation of the corporation only.

Hay U.D.C.—The Local Government Board have advised the council to provide a few working-class dwellings.

Holywell R.D.C.—A decision has been reached to build twenty-two workmen's houses, at an estimated cost of £5,230, on a site purchased from Lord Mostyn, and thirty houses at Bagilt, at an estimated cost of £7,695. The houses are to be let at a rental of 4s. 3d.

Ilford T.C.—Further schemes in other parts of the district are under consideration.

Margate T.C.—A scheme has received approval for [illegible] at an estimated cost of £9,470.

Wrexham R.D.C.—The engineer, Mr. J. Price Davies, has been asked to prepare town planning schemes for the district.

ROADS AND MATERIALS.

Belfast T.C.—The city surveyor, Mr. H. A. Cutler, has received instructions to prepare a report upon a proposal for the construction of a new road running from a point near Belfast Castle, on the Antrim road, to the extreme southern boundary of the city.

Bodmin T.C.—The council are asking the county council for a grant of £200 towards improving the road from Dunmere-hill to Little Kirland-road, and £250 for widening, grading, and strengthening the road from St. Nicholas to Carminnow Cross. They have also suggested to the county council the desirability of widening the metalled carriageway in the Lostwithiel-road and Cooksland-road.

Bodmin T.C.—The county council have been asked for a grant of £300 for the purpose of road improvement and widening.

Bognor U.D.C.—The council have deferred for a month the consideration of the proposed Lansdowne improvement, consisting of the widening of the promenade and the highway from opposite West-street to the pier, by carrying out to sea the existing sea defences and thus enabling the road there to be constructed 50 ft. wide and the promenade 33 ft. wide. The estimated cost of this work is £8,194.

Brighton T.C.—The Works Committee have accepted the tender of the Slieve Donard grey granite quarries to supply, in accordance with the specification prepared by the borough surveyor, Mr. H. Tillstone, 2,000 ft.-run 6-in. by 10-in. granite edge kerb, 3,000 ft.-run 12-in. by 6-in. granite flat kerb, and 3,000 ft.-run 12-in. by 6-in. granite flat channel, at 1s. 4d. per foot, 1s. 7½d. per foot, and 1s. 7d. per foot respectively.

Croydon T.C.—Works of kerbing, channelling and paving with asphalt and granite setts, estimated to cost £60,131, are to be carried out.

Dundee T.C.—The tender of Mr. David Horsburgh, Dundee, at £657, has been accepted for the paving of Ann-street.

Edmonton U.D.C.—The surveyor, Mr. Cuthbert Brown, has been authorised to communicate with the county council, the Road Board and the Government with a view to ascertain what grants they would be prepared to make in aid of a scheme for widening Silver-street and improving and widening Angel-road.

Holyhead U.D.C.—The surveyor, Mr. A. Asquith, has received instructions to prepare plans of a proposed new road between Porthyfelin-road and Llaingoch-road.

Leicester T.C.—A scheme for the improvement of Welford-road is to be carried out at an estimated cost of £3,000.

Norfolk C.C.—The county surveyor, Mr. T. H. B. Heslop, at a meeting of the Eastern Highways Committee on Saturday, stated that the scheme for the relief of unemployment was before the Relief Committee at the last meting, and received their sanction, and was referred to the Highways Committee for their approval and any suggestions they might make. The scheme provided for road widening at Morston, Colkirk, Brisley, Overstrand, Cromer (Carrington Villas and Mr. Barclay's Farm), Ludham, Belaugh, Ormesby, Wells (near railway crossing), Burnham, Wootton, Bilney, Massingham, Alby, Yaxham, Foxley, Trowse-street, and improvements at various corners, the estimated cost being £15,770. The proposal, it was stated, came from the Road Board. The committee adopted the scheme as a general basis to work upon.—The committee also decided to give effect to the requirements of the War Office for the construction of a military road practically from Yarmouth to Heacham, 5 miles from the coast, and parallel with the coast for that distance.

Romford U.D.C.—The surveyor, Mr. Herbert T. Paige, has received instructions to negotiate with the owners affected by the proposed improvement at Pettits-lane and Brentwood-road, and to prepare a scheme for submission to the county council.

South Shields T.C.—Granite sett paving is to be laid in Fowler-street at an estimated cost of £1,277.

Sutton (Surrey) U.D.C.—The surveyor, Mr. W. H. Grieves, has been asked to submit an estimate for taking up Downs-road.

Swansea T.C.—Schemes of road improvement estimated to cost £15,667 were recommended by the Highways Committee.

Tottenham U.D.C.—It has been agreed to repave by direct labour the carriageway of Green-lanes with wood on a 12-in. concrete foundation in lieu of the existing 6-in. foundation, at an estimated cost of £15,457, subject to the Middlesex County Council defraying the cost, Green-lanes being a "main" road. It is estimated this will provide work for 300 men for twenty-four weeks.

Wells R.D.C.—The council have passed a resolution in support of a scheme for a new road from Wells to Cheddar.

York T.C.—The city engineer, Mr. F. W. Spurr, has received instructions to prepare plans and specifications of a proposed new road from Salisbury-terrace to Waterworks-lane, a new road from Bishopthorpe-road to Terry-avenue, and to report with respect to other reconstruction.

SEWERAGE AND SEWAGE DISPOSAL.

Bulkington U.D.C.—The council have approved a scheme of sewage disposal which is estimated to cost £8,500.

Feckenham U.D.C.—A report has been prepared on proposed sewage works, which are estimated to cost £430.

Tottenham U.D.C.—It has been decided to demolish the old tanks at the sewage disposal works, at an estimated cost of £3,000.

Willington U.D.C.—A tender at £234 has been accepted for the extension of the sewage disposal works.

Workington T.C.—Upon the advice of the borough surveyor, Mr. H. B. Williams, certain sewerage work at North Side, for which it had been decided to advertise for tenders, will be carried out departmentally in the event of unemployment becoming acute.

WATER, GAS, AND ELECTRICITY.

Brighton T.C.—It is proposed to effect water main extensions at an estimated cost of £873.

Castle Ward (Northumberland) R.D.C.—Messrs. Taylor & Wallin, civil engineers, of Newcastle-on-Tyne and London, have been instructed to prepare a scheme and report upon the water supply of the parish of Whalton. The water will probably be pumped from a well.

Clogher R.D.C.—A report by Mr. F. E. Townsend advising the preparation of a water supply scheme for Augher and Clogher, has been referred to a committee for consideration.

Cromer U.D.C.—The council have accepted the tender of the gas company, at £341 per annum, for lighting the town. The number of lamps is 182.

Foleshill R.D.C.—It has been decided to sink a borehole adjacent to one of the Newdegate Colliery Company's shafts, for the purpose of a water supply for Bedworth.

Poole T.C.—The question of the proposed new water undertaking, involving an expenditure of about £30,000, has been referred to a special meeting of the council in committee.

Sutton (Surrey) U.D.C.—The surveyor, Mr. W. H. Grieves, has received instructions to submit a report on the aëration and filtration of water.

Tottenham U.D.C.—Subject to the agreement with the Water Board, it has been agreed to proceed at once with replacing the obsolete hydrants, at an estimated cost of £1,100.

MISCELLANEOUS.

Norwich T.C.—The city engineer, Mr. A. E. Collins, has received instructions to build four water carts, at an estimated cost of £120, to replace those sold to the Government.

Southall-Norwood U.D.C.—The council have had under consideration various schemes prepared by their engineer, Mr. Reginald Brown, M.INST.C.E., for the purpose of finding useful work in view of any distress which might arise owing to the war, and have approved the following to be carried out if the necessity arises: Fifty-four workmen's houses; lakes at Southall Park and the recreation ground; and the laying out of the grounds of the Manor House recently purchased by the council. In addition to these works the council are carrying out sewerage and road works at a cost of something like £4,000. The total cost of these works is estimated to amount to about £27,000, and the greater portion of the money will be spent on labour.

Tottenham U.D.C.—The engineer, Mr. W. H. Prescott, reported lately that there are at present from 80,000 to 90,000 loads of clinker deposited on the refuse destructor site. The council had experienced difficulty in disposing of the refuse, offers to give it away having been made from time to time. Unless the clinker could be disposed of free of cost, considerable expenditure must sooner or later be incurred in having it carted away. It was therefore recommended that the clinker should be removed and placed round the outside edge of the whole of the Marshes to form a footpath of an average width of 12 ft., subject to a grant from the Local Government Board. The estimate of the cost was £3,223, of which £2,400 would be for labour, and it would engage eighty-eight men for twenty-four weeks. The council have also decided to plant trees on the Marsh at a cost of £142, of which labour would absorb £193, and it would employ eight men for twenty-four weeks. This was also subject to the Local Government Board making a grant.

PERSONAL.

Mr. W. T. Ward, deputy surveyor to the Llandudno Urban District Council, has had his salary advanced from £200 to £225 per annum.

Mr. Robert A. Corry, late assistant surveyor to the Antrim County Council, has been granted a superannuation allowance of £80 per annum.

Mr. M. Oliver has been appointed to act as deputy surveyor of Bodmin during the absence of the borough surveyor (Mr. R. T. Buscombe) with the Territorials.

Mr. Colin H. Macfarlane, burgh surveyor and cleansing superintendent of Rutherglen, has been appointed assistant superintendent of cleansing to the Glasgow Corporation, at a salary of £250.

Mr. R. G. Gibson has left Messrs. Ham, Baker & Co., Limited, whom he represented in the Midlands for a number of years, and is now travelling for the Anglo-American Petroleum Products Company, whose road materials include Mexphalte and Fluxphalte.

Mr. Henry Burton, of Enfield, Middlesex, timber merchant, creosoter, and paving-block manufacturer, a partner in the firm of Messrs. Thomas Gabriel & Sons & Burton's, who died recently at the age of sixty-seven, has left estate of the value of £21,808.

Mr. H. K. Liversidge, junior assistant in the surveyor's department, Great Crosby, and a member of the 6th Battalion King's Liverpool Regiment, was, we regret to state, killed by a train last week while guarding the London and Brighton Railway line near Redhill.

Mr. G. M. Seals, assistant surveyor to the Maldens and Coombe Urban District Council, who is fully qualified by examination to act as inspector of nuisances under the Public Health Act, will assist in carrying on the work of the sanitary department during the absence on military service of Captain Hunter, the sanitary inspector.

Mr. H. E. Lunn, B.SC., second assistant to the borough engineer of Tunbridge Wells, who has joined Lord Kitchener's Army, was instrumental in forming a local company of professional and business men, seventy-eight of whom recently had an enthusiastic send-off by the mayor and corporation. Of this number no fewer than fifteen were borough officials.

Mr. H. B. T. Wakelam, B.A.(CANTAB.), (late Marlborough College and Cambridge University Officers' Training Corps), only son of Mr. H. T. Wakelam, county engineer of Middlesex, has gone to the Front. Gazetted to the Royal Fusiliers as second lieutenant on the Wednesday, he left England with his battalion on the Friday night following. He is well known as

Rogers, an ballet lady in connection with Cambridge University and the Harlequins.

Mr. D. E. Lloyd Davies, an engineer of Aix-les-Bains, has been appointed city engineer of Cape Town at a salary of £2,000 a year. The appointment was made on July 29th, upon a unanimous recommendation (a report of Mr. Davies by the Finance Committee of the Cape Town Corporation. Mr. Lloyd Davies was formerly second engineer of Birmingham, [illegible] has a considerable reputation as a consulting engineer, particularly with respect to [illegible] Tunbridge Wells Sewage Disposal.

FOR OTHER ADVERTISEMENTS

See End of Paper.

LANGPORT RURAL DISTRICT COUNCIL.

SURVEYOR'S ASSISTANT.

The Council invite applications from qualifying Engineers and Surveyors for the appointment of a Surveyor's Assistant. Salary at the rate of £75 per annum, payable monthly.

The person appointed will act under the supervision of the Surveyor and perform such duties as he may require.

Applications, in candidate's own handwriting, stating age and qualifications and accompanied by copies of not more than three recent testimonials, to be sent to the undersigned not later than first post on Tuesday next, 22nd instant.

(By order)
EDWD. Q. LOUCH,
Clerk to the Council.

Council Offices,
Langport, Somerset.
September 16, 1914. (1,933)

BUXTON URBAN DISTRICT COUNCIL.

ROAD FOREMAN AND BUILDING INSPECTOR.

The above Council invite applications for the combined appointment of Road Foreman and Building Inspector.

Applicants must be between 30 and 45 years of age, thoroughly experienced in the construction of macadam and paved roads, sewers, and general highway administration, and accustomed to the control and supervision of men and team labour.

Preference will be given to applicants with municipal experience in similar capacity.

Remuneration will be at the rate of 37s. 6d. per week, rising by instalment to £2 5s., on recommendation of the Surveyor.

Forms of application and particulars of duties may be obtained from the undersigned, to whom applications are to be forwarded not later than Thursday noon, October 1st next.

F. LANGLEY,
Engineer and Surveyor.

Town Hall,
Buxton.
September 16, 1914. (1,937)

ASSISTANT ENGINEERS required for the East Africa Protectorate Public Works Department, for not less than twelve months, with possible extension. Salary £300. Free first-class passages and quarters. Age 22-35. Candidates should have good technical education and be Associate Members of the Institute of Civil Engineers, or have passed some examination qualifying for admission as such, and possess practical experience on civil engineering works. Apply at once by letter to the Crown Agents for the Colonies, Whitehall Gardens, London, S.W. (1,941)

ASSISTANT ENGINEERS required by the Government of the Gold Coast for the Public Works Department, for two tours of twelve months, with possible extension. Age 25-40. Salary £350-£10—£400. Furnished quarters and first-class passages. Two months' leave in England on full salary after each tour, increased to four months if returning. Candidates should have had a good technical education, a regular training as a civil engineer, and a practical knowledge of surveying, levelling, and estimating, particularly in regard to ordinary municipal work and building construction. Associate Membership of the Institution of Civil Engineers essential. Apply at once to the Crown Agents for the Colonies, Whitehall Gardens, London, S.W. (1,942)

FAREHAM RURAL DISTRICT COUNCIL.

LEE-ON-THE-SOLENT MAIN SEWERAGE.

RESIDENT ENGINEER.

The Fareham Rural District Council invite applications for the appointment of a Resident Engineer in connection with the above, which consists of about 4½ miles of Sewers, including Sea Outfall Pipe and Submarine Work.

Considerable experience in the supervision of Sewerage Works is essential, and the candidate must be able to test materials, set out work, use the various surveying instruments, and measure up work done.

The person appointed will be required to work under the direction of the Engineer, Mr. Wilberforce Cobbett, ASSOC.M.INST.C.E., and to devote the whole of his time to the work during the contractor's working hours.

The work is expected to last twelve months, and the appointment will be subject to one month's notice on either side.

The salary will be 3½ guineas per week.

Applications, endorsed "Resident Engineer," stating age and qualifications, accompanied by copies of three recent testimonials, to be sent to the undersigned not later than 10 o'clock a.m. on Thursday, the 8th October, 1914.

The successful applicant will be required to reside at Lee.

Applicants who canvass any Member of the Council, either directly or indirectly, will be disqualified.

ALFRED LAKER,
Clerk to the Fareham Rural District Council.
97 West-street,
Fareham, Hants. (1,939)

COUNTY BOROUGH OF SOUTH SHIELDS.

TEMPORARY ENGINEERING AND SURVEYING ASSISTANT.

Applications are invited by the above-named Council for the appointment of a Temporary Assistant in the Borough Engineer's Department. Applicants must be good draughtsmen, with a thorough knowledge of surveying and levelling, and preference will be given to one having had experience in a municipal office. Salary, 35s. per week.

Applications, stating age, experience and qualifications, together with copies of three recent testimonials, and stating the earliest date on which the applicant can take up his duties if appointed, must be delivered to the undersigned on or before Thursday, October 1 1914.

LESLIE ROSEVEARE,
(1,934) Borough Engineer.

ST. AUSTELL RURAL DISTRICT COUNCIL.

Tenders are invited for the construction of a tunnel, 500 yds. in length, or thereabouts, with the necessary airshafts, and for the laying of a stoneware pipe sewer therein, and extension of the same some 2,000 yds. in all, with the requisite manholes, &c., so as to connect the sewerage system of Mount Charles with that of Charlestown.

Plans and Specifications may be seen at the office of Mr. W. H. Moffat, C.S.I., the Surveyor to the Council, Council Offices, St. Austell, or at Messrs. Henderson & Son, the Engineers, Lemon Quay, Truro, any morning between the hours of 10 and 12.

A deposit of £3 3s., which will be refunded on the receipt of a *bonâ-fide* Tender, will be required.

All Tenders must be submitted to me on or before Wednesday, the 30th inst. The lowest or any Tender will not necessarily be accepted.

JOHN STEPHENS,
Clerk to the Council.

St. Austell.
September 16, 1914. (1,936)

BOROUGH OF EALING.

DESTRUCTOR AND SEWAGE WORKS MANAGER.

The Town Council of this Borough invite applications for the post of Destructor and Sewage Works Manager at their Southern Works, South Ealing. Commencing salary 50s. per week, together with house (rent free), coal and light.

Applicants aged between 35 and 45 must have held a similar appointment, and be capable of taking charge of a Staff of between 40 and 50 men, and be thoroughly conversant with the working of Destructors, the running of Steam and Hydraulic Machinery,

and the working of a Chemical Precipitation and Bacterial Filtration Sewage Works.

A list of duties and other particulars will be forwarded upon application.

Applications, in Candidate's own handwriting, endorsed "Destructor and Sewage Works Manager," enclosing copies of not more than three recent testimonials, to be delivered to the undersigned not later than first post on Tuesday, the 29th day of September, 1914.

W. R. HICKS, M.INST.C.E.,
Borough Engineer and Surveyor.

Town Hall,
Ealing, W.
September 16, 1914. (1,938)

HANWELL URBAN DISTRICT COUNCIL.

The above Council are prepared to receive Tenders for the supply of

(1) Broken Guernsey Granite.
(2) Distilled Tar.

Forms of Tender and further particulars may be obtained on application at the Council Offices, Hanwell.

Tenders to be delivered to the undersigned not later than the 28th September, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

Any person, firm or company canvassing any Member of the Council will be disqualified for receiving orders or contracts from the Council.

(By order)
PERCY SCOTT,
Clerk to the Council.

Council Offices,
Hanwell, W.
September, 1914. (1,932)

CITY OF LEEDS.

LEEDS CORPORATION ACT, 1908 (SEWERAGE).

SEWAGE DISPOSAL SCHEME AT THORPE STAPLETON.

CONTRACT No. 50.

Consisting of the execution of the following sections of the work on the Sewage Works Lands at Thorpe Stapleton:—

Part No. 1.—Three Screening Chambers, Screenhouse, three Detritus Pits, two Mixing Chambers, Distributing Chamber and all accessories.

Part No. 2.—Four Precipitation Tanks, Main Gauging Chamber, Storm Overflow, Storm Overflow Culvert and Outlet, &c.

Part No. 3.—Eighteen acres of Bacteria Beds, complete with Silt Mains, Effluent Channels and Culverts and Gauging Chambers, &c., including the laying of Cast-iron Feed Mains.

To Public Works Contractors.

The Sewerage Committee of the Leeds Corporation are prepared to receive Tenders for the above work.

The Contract Drawings may be inspected, and copies of the Specification, Bills of Quantities, Form of Tender, &c., can be obtained at the office of the Sewerage Engineer (Mr. Geo. A. Hart, M.INST.C.E.), 26 Great George-street, Leeds, on and after Monday, the 5th October, 1914, upon payment of a deposit of £10, which will be returned on receipt of a *bonâ-fide* Tender. Cheques must be crossed, and made payable to the City Treasurer, Leeds.

Tenders must be on the official forms supplied, enclosed and sealed in the endorsed envelope provided, and delivered at the Town Clerk's Office, Pearl Chambers, East-parade, Leeds, not later than 10 a.m. on Wednesday, the 21st October, 1914.

The Corporation shall not be bound to accept the lowest or any Tender.

(By order)
ROBERT E. FOX,
Town Clerk.

Town Clerk's Office,
Pearl Chambers,
East-parade, Leeds.
September 30, 1914. (1,935)

WANTED. Second hand 6-ton Steam Roller. Write, stating Maker's number, weight empty and in working order, and full particulars, Box 1,466, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,940)

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—MR. J. S. PICKERING, M.INST.C.E., Borough Surveyor and Water Engineer, Cheltenham.

A meeting of the institution will be held in the East Midland District at Cleethorpes to-morrow (Saturday).

PROGRAMME.

11.30 a.m.—By permission of the Cleethorpes Urban District Council, members will assemble in the council chamber and will be welcomed by the chairman of the council (Alderman Wm. Grant, J.P., C.C.).

Papers by Mr. C. H. Waithman, ASSOC.M.INST.C.E., on "The Municipal Works of Cleethorpes," and by Mr. J. S. Alford, M.INST.C.E., on "The Cleethorpes New Sewerage Scheme and Outfall Works," which will be taken as read.

Discussion.

12.15 p.m.—Members will proceed to inspect the council depot and the refuse destructor and sewage pumping station (both approaching completion), fire station, &c., underground conveniences, and pier approach shelter. Motor chars-à-banc will be provided by kind permission of Mr. H. L. White, tramways manager.

1.30 p.m.—Luncheon at Cliff Hotel (tickets 2s. 6d. per head).

2.45 p.m.—Members will proceed along the Kingsway, inspecting *en route* the new pavilion, underground convenience, meteorological station, &c. Motor chars-à-banc will again be provided to take members to outfall sewerage works (details of construction of which will be explained by Mr. Alford), after which, time permitting, members will return to Cliff Hotel by a circuitous route.

5 p.m.—Members will reassemble in the council chamber for tea (provided by Mr. C. H. Waithman).

Resume discussion.

E. H. CRUMP, ASSOC.M.INST.C.E.,
Hon. District Secretary.

Hinckley.

HINCKLEY MEETING.

An East Midland District meeting is to be held at the council offices, Hinckley, on Saturday, October 3rd.

PROGRAMME.

10.45 a.m.—Meet at the council offices, Hinckley, to discuss general district business.

11.15 a.m.—The members and visitors will be received by the chairman (Mr. G. Kinton, J.P.), and members of the Hinckley Urban District Council.

11.30 a.m.—Discussions on the following papers—"Eleven Years' Municipal Work at Hinckley," by Mr. E. H. Crump, ASSOC.M.INST.C.E., F.S.I., engineer and surveyor to the Hinckley Urban District Council; and "By-laws and the Housing Question," by Mr. W. H. Court, ASSOC.M.INST.C.E., borough engineer's department, Leicester.

12.45 p.m.—Inspection of the public baths adjoining the council offices.

1 p.m.—Luncheon at the Union Hotel at the kind invitation of the chairman and members of the Hinckley Urban District Council.

2.15 p.m.—Proceed in motor conveyances (at a charge of 3s. per person) to inspect the workmen's dwellings erected and in course of erection in Rugby-road, &c., and thence to the Snarestone Waterworks, 14 miles distant, to inspect the pumping station, &c., where tea will be provided by Mr. E. H. Crump.

4.15 p.m.—Leave Snarestone and drive to Gopsall Park, where members will be given the opportunity of inspecting the gardens, by kind permission of Earl Howe.

6 p.m.—Arrive at Hinckley Railway Station.

E. H. CRUMP, A.M.I.C.E., *Hon. District Secretary*, Hinckley.
E. G. MAWBEY, M.INST.C.E., *District Chairman*, Leicester.

J. W. DUDLEY ROBINSON, F.S.I., F.N.D., *Secretary*,
92 Victoria-street, Westminster, S.W.

URBAN DISTRICT COUNCIL OF FLEET, HANTS.

APPOINTMENT OF CLERK OF WORKS.

The consideration of the appointment for the above has been deferred for the time being.

(By order)
W. H. WRIGHT,
Clerk to the Council.

Council Offices,
Fleet. (1,919)

BOROUGH OF ROYAL TUNBRIDGE WELLS

BOROUGH AND WATER ENGINEER'S DEPARTMENT

TEMPORARY ASSISTANT.

The Council are prepared to consider applications for the post of Temporary Assistant in the Borough and Water Engineer's Department. The person appointed must be a good Draughtsman and be thoroughly experienced in the use of the Dumpy Level, Theodolite, and other usual Surveying instruments, in the pegging out of Sewer Runs for Sewerage Works, taking of Levels, and setting out of Works; also the preparation of Estimates, and other work of a Borough Engineer's Office, and must have had good experience in a similar capacity under a public authority.

The appointment is rendered necessary by the enlistment of members of the Staff in His Majesty's Army in consequence of the present European War, and, subject to the services of the person appointed proving entirely satisfactory, will be for a period of not less than six months, with a possibility of extension should the permanent Staff not have returned to their duties at the end of that period.

Any further information, if desired, may be obtained on application to Mr. W. H. Maxwell, A.M.I.C.E., Borough and Water Engineer.

Salary will be at the rate of £3 (Three Pounds) per week, paid monthly.

Applications to be in Candidate's own handwriting, and to state age, past experience, and *earliest* date when duties can be commenced, to be accompanied by copies of not more than three recent testimonials, to be sent to the undersigned not later than 10 a.m., Tuesday, 29th September, 1914.

W. C. CRIPPS,
Town Clerk.

Town Hall,
Tunbridge Wells.
September 14, 1914. (1,924)

HAMPTON URBAN DISTRICT COUNCIL.

ROAD FOREMAN.

The above Council require a Road and General Foreman in the Highways Department.

Applicants must be suitable and competent men, and thoroughly qualified both in the construction and maintenance of roads and sewers, and experienced in the management of men and team labour, &c.

Wages £2 5s. per week, with 2s. 6d. allowance for bicycle.

Applications, in candidate's own handwriting, stating age, qualifications, &c., and accompanied by copies of not more than three recent testimonials, endorsed "General Foreman," to be sent to the undersigned not later than 5 p.m. on Thursday, the 1st day of October, 1914.

(By order)
SIDNEY H. CHAMBERS,
Surveyor.

Surveyor's Office,
Public Offices,
Hampton, Middlesex.
September 16, 1914. (1,929)

PORTSLADE-BY-SEA URBAN DISTRICT COUNCIL.

SURFACE-WATER SEWERAGE WORKS.

CLERK OF WORKS REQUIRED.

The above Council propose to appoint a Clerk of Works at a salary of £2 10s. to £3 per week, according to qualifications, to superintend under the Engineer and the Resident Engineer the carrying out of the above works, and invite applications from persons who have had experience in similar work.

Applications, sealed and endorsed "Clerk of Works," must be accompanied by not more than three recent testimonials (copies), and should reach me not later than 29th September, 1914.

Canvassing, direct or indirect, will disqualify.

Dated this 18th day of September, 1914.

ERNEST H. KEMPE.

Council Offices,
Portslade-by-Sea. (1,920)

EAST SUFFOLK COUNTY COUNCIL.

MAIN ROADS

APPOINTMENT OF DIVISIONAL SURVEYOR.

Applications are invited for the appointment of Divisional Surveyor in the Lowestoft District (under the County Road Surveyor) of a District of Main Roads in the County.

Applicants must be not more than 30 years of age, and must be prepared to devote their whole time to the duties of the office, and to commence such duties as early as possible.

Salary £150 per annum, rising by annual increments of £10 to £180 per annum, with an allowance of £20 for the purchase and upkeep of a motor cycle, such salary and allowance to include all travelling and other expenses, except travelling out of District on County business when authorised by County Road Surveyor, Postages, Telegrams and Stationery.

Applications, in candidate's own handwriting, endorsed "Divisional Surveyor," and accompanied by copies of not more than three recent testimonials, must be sent to the undersigned not later than the 26th September, 1914.

Personal canvassing will disqualify.

Forms of application and particulars of the duties and terms of the engagement may be had on application to

W. JERVIS,
County Road Surveyor.

County Hall, Ipswich.
September 15, 1914. (1,927)

EAST SUFFOLK COUNTY COUNCIL.

MAIN ROADS

GENERAL ASSISTANT.

Applications are invited for the appointment of a General Assistant in the County Road Surveyor's Office for the period of the war.

Candidates must possess a sound, practical knowledge of surveying and levelling, and must be quick and accurate with figures.

Commencing salary at the rate of £90 per annum, rising, on approved service, by annual increments of £10, to £120 per annum.

Applications, in candidate's own handwriting, stating age, experience, and enclosing copies of three recent testimonials, and endorsed "General Assistant," to be sent to County Road Surveyor, County Hall, Ipswich, on or before 10 a.m. of the 26th September, 1914.

Duties to commence as soon as possible.

W. JERVIS,
County Road Surveyor.

County Hall, Ipswich.
September 15, 1914. (1,926)

BRIDGWATER RURAL DISTRICT COUNCIL.

ASSISTANT SURVEYOR.

Applications are invited for the appointment of General Assistant in the Surveyor's Department to take the place, temporarily, of one who has joined Lord Kitchener's Force.

Candidates must have received a thorough training in a municipal surveyor's office, and be competent to make surveys and superintend the construction and maintenance of roads, bridges, &c.

Salary £85 per annum, such sum to include the upkeep of a cycle.

Applications, in candidate's own handwriting, stating age, training, qualifications, present and past experience, accompanied by copies of three recent testimonials, to be received by me not later than Saturday, September 26th, 1914.

W. ALEX. COLLINS,
Surveyor.

Bridgwater.
September 10, 1914. (1,908)

ENGINEER AND SURVEYOR to a large Urban District near Manchester has vacancy for articled pupil.—Write Box 1,461, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,892)

ARTICLED PUPIL required. Works include Pavilion, Baths, Drainage Scheme, &c., £100,000.—Apply J. Stanley Sawdon, A.M.I.C.E., Council Offices, St. Anne's-on-Sea, Lancs. (1,946)

TENDERS WANTED.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but we are responsible for their insertion on that day only if we are instructed to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to enable us to include their decision in the next issue of our columns. Such advertisements may, in case of emergency, *only, be telephoned (City No. 1046) subject to later confirmation by letter.*

COLWYN BAY AND COLWYN URBAN DISTRICT COUNCIL.

REFUSE DESTRUCTOR.

The above Council are prepared to receive Tenders from experienced firms for the erection of a Refuse Destructor, with Steam Boiler, Auxiliary Machinery, &c., complete.

Copies of the General Conditions, Specification, Form of Tender and Plans, may be obtained from the Consulting Engineer, Mr. E. M. Lacey, M.INST.C.E., 12 Victoria-street, Westminster, S.W., on payment of a deposit of five guineas, which will be refunded on receipt of a *bonâ-fide* Tender. Duplicate copies can be obtained on payment of one guinea, which will not be returned. Any further particulars may be obtained from Mr. William Jones, ASSOC.M.INST.C.E., the Council's Engineer and Surveyor, Council Offices, Colwyn Bay.

Tenders must be in the form attached to the Specification, and must be delivered to me not later than 11 o'clock in the forenoon on Thursday, the 8th day of October, 1914, in sealed envelopes, endorsed "Tender for Refuse Destructor."

The Council do not bind themselves to accept the lowest or any of the Tenders sent in.

JAMES AMPHLETT,
Clerk to the Council.

Council Offices,
Colwyn Bay.
September 2, 1914. (1,896)

BOROUGH OF ASHTON-UNDER-LYNE.

Tenders, in official envelopes, to be delivered to the undersigned not later than first post on September 28th, 1914.

The lowest or any Tender will not necessarily be accepted.

JOHN NEAL,
Borough Comptroller.

Town Hall,
Ashton-under-Lyne.
September 14, 1914. (1,921)

WATH-UPON-DEARNE URBAN DISTRICT COUNCIL.

The above Council is prepared to receive Tenders for the alteration and reconstruction of the Sewage Disposal Works at Common-lane, Wath-upon-Dearne.

The plans may be inspected, and a copy of the Specification, Bill of Quantities and Form of Tender obtained, on application to Mr. J. H. Drew, M.INST.M. AND CY.E., Engineer to the Council, Town Hall, Wath-upon-Dearne, on and after September 22, 1914, between the hours of 10 a.m. and 1 p.m. (except Saturdays), on payment of the sum of Five Guineas, which will only be returned upon the receipt of a *bonâ-fide* Tender, and the return of all documents.

Sealed Tenders, upon the form supplied, properly filled in and endorsed "Tender for Sewage Works," must be delivered to the undersigned not later than noon on Saturday, the 3rd day of October, 1914.

The Council does not bind itself to accept the lowest or any Tender.

NICHOLSON & CO., Solicitors,
Clerks to the Council.

28 High-street, Wath-upon-Dearne.
September 19, 1914. (1,928)

METROPOLITAN BOROUGH OF SHOREDITCH

WROUGHT-IRON [illegible] FENCING, &c.

The Council of the Metropolitan Borough of Shoreditch invite Tenders for the supply and erection of [illegible] Nos. 97 and 100, [illegible] Wrought-iron [illegible] Fencing, with all necessary [illegible] complete.

The Drawings, Specification and Form of Tender may be obtained from Mr. T. L. Hughes, Borough Surveyor, at the Town Hall, Old-street, E.C., upon a deposit of [illegible] which sum is returnable on the receipt of a bona-fide Tender after same has been duly considered by the Council. Tenders, on the Forms only, sealed and endorsed "Kerbing-terrace Railing," to be handed in not later than 10 a.m., Thursday, 24th September, 1914.

Trade Union rates of wages and hours must be observed, and no subletting is allowed. The Council does not bind itself to accept the lowest or any Tender.

(By order)

J. A. D. MILNE,
Town Clerk.

September, 1914. (1,923)

SOMERSET COUNTY COUNCIL.

The County Works Committee are prepared to receive Tenders for the rebuilding of Hatch Bridge, on the Taunton and Ilminster road at Capland, about 12 miles from Hatch Station.

The work comprises taking down the existing bridge, the provision of a temporary bridge, the building of a new bridge, 7-ft. 6-in. span, in reinforced concrete and masonry, and roadworks.

The Drawings, Specification, Form of Contract and Bond may be seen, and Bills of Quantities obtained, at the County Surveyor's Office, Wells, on and after the 17th September, on payment of Two Guineas, which sum will be returned to the Tenderer upon receipt of a *bona-fide* Tender and the return of the documents which have been supplied to him.

The Committee do not bind themselves to accept the lowest or any Tender.

Sealed Tenders, endorsed "High Bridge," must be delivered to the undersigned not later than 5 p.m. on Tuesday, the 29th September, 1914.

EDWARD STEAD, Assoc.M.Inst.C.E.,
County Surveyor.

Wells.
September 15, 1914. (1,925)

CITY OF WORCESTER.

TENDERS FOR FOOTBRIDGE.

Plans and Specification may be seen, and copies of Form of Tender obtained, at the City Engineer's Office, Guildhall, Worcester.

Sealed Tenders, upon the prescribed form, endorsed "Tender for Footbridge," to be sent in not later than 10 a.m. on Monday, the 28th September, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender.

THOMAS CAINK,
City Engineer.

Guildhall, Worcester.
September 15, 1914. (1,930)

BARNET URBAN DISTRICT COUNCIL.

TO ROAD CONTRACTORS AND OTHERS.

The Council invite Tenders for the construction of new roads on their Housing Estate, approximately 4,800 sq. yds., together with about 1,000-ft. run of sewers.

Plans and Specification can be seen at the Surveyor's Office, No. 40 High-street, Barnet, and all information obtained from the Architect on application by letter.

Tenders, on official forms only, and endorsed "Tenders for Roads Housing Estate," must be addressed to me, and delivered at the Council's Offices, No. 40 High-street, Barnet, not later than noon on Tuesday, 29th September, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

H. W. POOLE,
Clerk of the Council.

September 14, 1914. (1,931)

CITY OF SHEFFIELD.

TO CONTRACTORS AND BUILDERS.

The Improvement Committee of the City Council are prepared to receive Tenders for the execution of works in connection with the Covering of the River Sheaf, in the City of Sheffield, and consisting of the following:—

Bridge Widening, Exchange-street.
Covering of River Sheaf in Reinforced Concrete.
New Weir across River.
New Bridge and Retaining Wall, Newsstreet.

Particulars and Forms of Tender, together with "Conditions of Contract," may be obtained, and Drawings inspected, at the Office of the City Engineer, Town Hall, Sheffield, on and after Monday, September 21st, on payment of the sum of £1, which will be returned on receipt of a *bona-fide* Tender. Applications to be endorsed "Covering of River Sheaf."

Tenders, enclosed in official envelope provided, to be delivered at the City Engineer's Office not later than 10 o'clock a.m. on Saturday, October 3rd, 1914.

The Committee do not bind themselves to accept the lowest or any Tender.

Any person or firm sending in a Tender will be required to add a Schedule to such Tender, stating the names of the various classes of labour which he or they intends or intend to employ, together with the places where such labour will be employed, and the rates of wages, hours of labour, and conditions of employment to be paid and observed in respect to each class of labour, all of which, as shown in such Schedule, shall comply with the City Council's form of clauses respecting wages, hours, and conditions of labour, and prohibition against assigning or subletting, a copy of which will appear in the "Conditions of Contract."

(By order)

WILLIAM E. HART,
Town Clerk.

Town Hall,
Sheffield.
September 14, 1914. (1,922)

URBAN DISTRICT COUNCIL OF ENFIELD.

TO CONTRACTORS.

The Council invite Tenders for Making Up the following Private Streets in their Districts—viz.:—

Waverley-road, Enfield.
Crescent-road, Enfield.
Old Park-road, Enfield.

Plans and Specifications can be seen, Forms of Tender, and all information obtained, on application to Mr. Richard Collins, the Council's Surveyor, at these Offices, any day (except Saturday) between the hours of 9 a.m. and 5 p.m.

The Contractor will be required to observe Trade Union hours of labour and to pay wages according to the published scale of the London County Council for the time being in force.

Separate Tenders for each Road (on the Form supplied only) to be sent in to me not later than noon on Wednesday, the 23rd day of September instant, endorsed "Tender for ——."

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

T. W. SCOTT,
Clerk.

Public Offices,
Enfield, Middlesex.

EXAMINATIONS.

CITY OF LONDON COLLEGE,

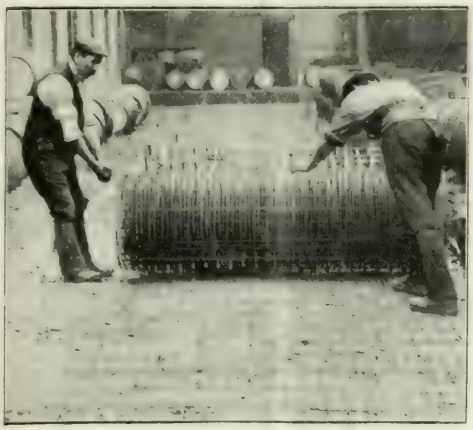
White-street and Ropemaker-street,
Moorfields, E.C.

Michaelmas Term Commences September 28th.

COURSES in preparation for the SURVEYORS' INSTITUTION EXAMINATIONS.

Courses are also arranged for the Examination of the Auctioneers' Institute. Full particulars on application to

DAVID SAVAGE,
(1,873) *Secretary.*



To strengthen this Road-bed

B.R.C. Road-Bed Reinforcement is being laid between the two thicknesses of concrete.

B. R.C. ROAD-BED
REINFORCEMENT

Consists of a high-grade steel wire mesh, the transverse wires of which are securely welded to the horizontal wires by a patent electrical process.

The material is made in rolls 6 ft. wide and to any length required. It is easy to unroll or otherwise handle, and requires no expert labour to instal. By reason of its continuity of construction no portion of the reinforcement can, by any chance, be omitted or misplaced or accidently disturbed

A road-bed laid with 6 in. of concrete and reinforced with B.R.C. Mesh is stronger than a 12 in. road-bed without such reinforcement.

A B.R.C. Mesh reinforced road lasts longer, costs less to maintain, takes less time to construct, and needs much less supervision during construction.

Complete COURSES OF PREPARATION for these EXAMINATIONS are conducted by Messrs.

PARRY, BLAKE & PARRY & B. W. ADKIN,

who have successfully prepared over 3,000 candidates and 108 prizewinners, including 12 Gold Medallists, 15 Silver Medallists, 18 Institution Prizemen, &c.

The Courses are given either in Evening Classes, by Correspondence, or in Office (study during the daytime at 82 Victoria-street, with personal help).

The 6 and 18 Months' Courses for the Examinations of March, 1915 and 1916 respectively, will be commencing early in September.

Messrs. Parry, Blake & Parry also conduct Courses of Preparation, with the highest success, for the Examinations of **THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS**, &c.

The teaching is done personally by the members of the firm, namely:

Mr. RICHARD PARRY, F.S.I., A.M.I.C.E., B.SC.(LOND.), Barrister-at-Law.

Mr E. H. BLAKE, F.S.I. (with Special Sanitary Science Diploma), Gold Medallist, S.I., 1911, F.I.SAN.E., M.R.SAN.I., and Diploma of the Institution of Municipal and County Engineers.

Mr. A. E. PARRY, F.S.I., and

Mr. B. W. ADKIN, F.S.I., F.R.S., M.R.A.S.E., Silver Medallist R.S.A.S., Barrister-at-Law.

A Staff of fully qualified Assistants is also engaged.

For full particulars of these Courses, or for any advice with respect to the Examinations, please apply to

Messrs. PARRY, BLAKE & PARRY,

Tele., Victoria 6680. 82 Victoria-street, Westminster.

Municipal Engineers' Section

EXHIBITION

April 13th to 24th, 1915.

MEXPHALTE

Special Prices during the War

We have arranged to quote specially low prices for Mexphalte, the ideal Mexican Bitumen, to all PUBLIC AUTHORITIES executing road work during the War.

Grouting with Mexphalte is simplicity itself, and can be carried out by unskilled labour.

Write for particulars:

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. SEPTEMBER 25, 1914. No. 1,184.

Minutes of Proceedings.

The Cleethorpes Meeting.

The enormous increase in the population of Cleethorpes which has taken place in recent years has naturally had a material effect upon the activities of the district council. The figures given by Mr. Charles Waithman, ASSOC.M. INST.C.E., the surveyor to the council, in the paper which he read at last Saturday's meeting of the Institution of Municipal and County Engineers, show that the population has practically doubled since 1911. This increase is due partly to the development of the steam trawler industry, and partly to the growing popularity of the town as a holiday resort. It is not surprising therefore that the works described in Mr. Waithman's paper were of a varied and interesting character, although he did not deal with the new sewerage scheme and outfall works, which were the subject of a separate paper by Mr. John S. Alford, M.INST.C.E. Having referred to various aspects of highway administration and maintenance, Mr. Waithman passed to the subject of building by-laws. These are at present under revision, as a result of which it is hoped to secure, among other things, more satisfactory control over the erection of sheds and temporary buildings. It is mentioned incidentally in the paper that Mr. Waithman is engaged upon the preliminary details of a town planning scheme, the scheduled area comprising approximately 10,000 acres, and embracing parts of the County Borough of Grimsby and the Grimsby Rural District Council. The main interest in this announcement lies in the fact that the whole area of the urban district is but 1,184 acres, or rather more than one-ninth of the area which it is proposed to include in the scheme. While we do not wish to say anything to discourage a local authority which has always been alive to the best interests of its district, it will be interesting to see what view the Local Government Board will take of this rather ambitious project. In dealing with refuse destructors, Mr. Waithman pointed out that his original scheme provided for a three-cell back-fed destructor, capable, of a one-cell extension. On the loan inquiry, however, the Local Government Board asked for the construction of two separate sets of furnaces, with provision for a one-cell extension to each, an increase in the height of the chimney shaft from 100 ft. to 125 ft., and the construction of the inclined roadway in either brickwork or concrete. A scheme embodying these requirements was ultimately undertaken, and those present at the meeting were able to inspect the work at a very interesting stage, with one two-cell unit completed and the other in course of construction.

Turning now to Mr. Alford's paper, which consisted in the main of a lucid description of the works designed and constructed under the direction of his firm, considerations of space necessitate our confining ourselves to two points for comment. The first is in regard to the storage tank. The original design was for a reinforced concrete tank on reinforced concrete piles. The estimated cost in round figures was £10,000. The Local Government Board sanctioned the design and gave ten years for the repayment of the loan. The author re-designed the tank, however, using mass concrete and timber piles. The estimated cost was £13,750, for which the board indicated their intention to give twenty-five years for repayment. The effect of this comparatively short period for repayment in the case of a reinforced concrete structure was that, whereas the annual loan charges for the more expensive mass concrete tank were £880, those for the reinforced concrete tank were £1,233. In these circumstances the mass concrete design was adopted. While fully realising the difficulty of establishing a proper balance between the life of works and the immediate requirements of the purchaser, we fully agree with Mr. Alford's conclusion that there is need of co-ordination between the practice of the Committees of Parliament and the Local Government Board in respect to loan periods for constructional works. Parliamentary Committees, in deciding on the term for repayment, do not always take detailed evidence of the durability of the works to be constructed. The board make a detailed investigation. The results are often widely different in the two cases. For instance, in a recent case, a local authority having obtained by an Act a very long repayment period, proceeded to construct a substantial portion of the works by methods which, if under the purview of the Local Government Board, would have resulted in a ten years' period being fixed. The other matter to which we desire to refer arises from the fact that the greater part of these works were executed by direct labour. The consequence of this was that, in order to comply with the requirements of the Public Health Act, every important unit of plant or machinery had to be

publish statistics for each borough, but the Local Government Board had no power to do so. Local interests should not be overlooked. This is a point which should be borne in mind when the Public Health Acts are revised, when it should be made lawful to let work of this special character by limited tender.

* * *

The Hinckley Meeting.

The meeting of the East Midland District of the Institution of Municipal and County Engineers which is to be held at Hinckley to-morrow week promises to be of considerable interest. We understand that formal invitations have been sent only to members in the district, but it is hoped that many others from adjoining districts will make an effort to be present. As will be seen from the programme, which we print elsewhere in this issue, two papers will be submitted for discussion. The first of these, by Mr. E. H. Crump, the engineer and surveyor to the council, is entitled "Eleven Years' Municipal Work at Hinckley," a title which is self-explanatory. The second paper will, however, be of a more general character, the author, Mr. W. H. Court, of the borough engineer's department, Leicester, having selected as his subject "By-Laws and the Housing Question." The detrimental effect of a rigid code of by-laws on the economy of any housing scheme is among the more interesting questions which come within the scope of Mr. Court's subject, which should produce an interesting and profitable discussion. The afternoon will be devoted to a round of visits, which will include an inspection of workmen's dwellings erected and in course of erection, and the Snarestone waterworks. Finally, by permission of Earl Howe, the members will have an opportunity of inspecting the gardens of Gopsall Park. Luncheon, it may be pointed out, will be provided by the chairman and members of the district council; therefore those members who are desirous of attending the meeting should send in their names to Mr. Crump not later than to-morrow, in order that the necessary arrangements may be made for their accommodation and entertainment.

* * *

Town Planning Large Areas.

Among the papers read at the Cheltenham conference of the Institution of Municipal and County Engineers was one which was the result of a happy collaboration between the borough surveyor and town clerk of Sutton Coldfield. The experience of that borough in regard to town planning has been an interesting one. The council were from the first fully alive to the beneficial nature of the powers conferred upon them by the Act of 1909, and at once began to consider to what area under their control the provisions of the Act could with advantage be applied. Many proposals were made, and as the outcome of their consideration an area of 400 or 500 acres which were actually in course of development was selected. Subsequently, however, this area was enlarged to include lands which were considered likely to be developed within the next thirty or forty years, and a further extension took place in consequence of a request made by the owners at the statutory meeting. Practical experience of the difficulties and delays caused in dealing with so large an area has enabled the authors of this paper to make many useful suggestions. Among the more important matters of which they speak is the relationship between town planning and by-laws. The cry for the relaxation of the strict requirements of by-laws in certain cases is one which is deserving of much sympathy, but at the same time the occasions for relaxation should be selected with great discretion. In these days it is apt to be forgotten that building by-laws are framed for the purpose of securing public control of all kinds of building and road making, and this main object must be kept well in view in discussing the limits within which relaxation may wisely be permitted. The existing model by-laws may be considered as embodying the minimum requirements for obtaining a proper standard of building, and it is therefore difficult to justify any general relaxation. A good deal may be said, however, in favour of embodying in a town planning scheme some discretionary power by which the local authority would be enabled to deal with special cases on their merits. Another important matter discussed in the paper is the limitation of the number of houses to be erected per acre. Mr. Clarry, the borough surveyor, speaks from experience when he says that, although this may appear at first sight to be an easy matter, practical contact with the task shows it to be more difficult. He expresses the view that the only reasonable way in which to proceed is to limit the larger owners to an average number of houses to the acre, extending over the whole of their land, with a maximum number for any one acre, so as to allow as much variation as possible in laying out the houses on their estates; and then to restrict the smaller landowners to a fixed number on their land to conform with the average number on the large estates. In referring to the amended Procedure Regulations, the town clerk observes that they have resulted in the disappearance of much unnecessary work. This comment is satisfactory as coming from one who was among the earliest critics of the original regulations. Some extracts from this interesting paper will be found in another column.

* *

A Water Supply Dispute.

Many and various questions have arisen in connection with the subject of water supply. These have in the majority of cases been concerned with the interpretation of the expression "domestic purposes," as used in the Waterworks Clauses Act, 1847, or with some other clause or provision either in that statute or in some special Act. The dispute in *Hadham Rural District Council* v. *Challen* (noted at page 92 *ante*) was of a more unusual character, and involved the interpretation not of an Act of Parliament, but of a covenant in a deed. The council, as the water authority for their district, purchased by agreement certain farm lands for the purpose of constructing a reservoir, and it was part of the terms of the purchase that the council should (1) lay down pipes for a reasonable supply of water to the farm-house; (2) lay down pipes and erect a stand-pipe for a reasonable supply to the farm buildings; and (3) supply a reasonable quantity of water for the use of the house and buildings free of charge. At the date of this arrangement the farmhouse comprised about seven rooms, with kitchen, scullery, and so forth. Some time afterwards, however, it was sold, and the purchaser enlarged it by the addition of about a dozen rooms, part of the farm buildings being turned into a motor garage and the remainder being let to a non-resident farmer. In these altered circumstances the question arose whether the council were still bound by their agreement to continue a free supply to premises so entirely transformed in character and occupation from what they were when the agreement was made. The council contended that the character of the property had been so completely altered as to destroy its identity, and to relieve them from any obligation to supply water gratis to the house; and that in any event they were not bound to furnish a free supply to the farm buildings for

the purpose of washing motor-cars. This, in substance, was the view taken by Mr. Justice Neville. He held that the covenant only bound the council to give a free supply to the houses and buildings as they existed at the date of the agreement, and therefore that as regards the latter the obligation was entirely at an end. With respect to the buildings, however, inasmuch as they remained substantially unaltered the obligation was still subsisting, but the water must not be used for the washing of motor-cars housed in the garage.

* * *

Councillor as Surveyor.

The methods of certain local authorities in making appointments to public offices afford an interesting, if rather depressing, study, and the frequency with which complaints arise does not tend to diminish. It is not a fortnight ago that we drew attention to the appointment of a whole-time officer as "inspector of nuisances and surveyor, &c.," at a commencing salary of £80 a year. That case was typical of many in which the services of men possessing technical skill are sought at what can hardly be described as a living wage. An example of another large class of cases which give rise to legitimate complaints is afforded by the method recently adopted by the Fowey Town Council in appointing a borough surveyor. When this appointment became vacant it was duly advertised, and ultimately three candidates were interviewed by the council. Of these, one hailed from St. Ives, another was the assistant surveyor at Newquay; while the third was Mr. W. T. H. Northcote, a member of the council. Can our readers guess who was appointed? We cannot undertake to offer any prizes, as we are confident that in any such guessing contest every competitor would be correct. Of course, Mr. Northcote was the successful candidate, receiving the votes of all his colleagues save one. Of his qualifications we know nothing, and so we are unable to comment upon that aspect of the case. Apart from that, however, two points remain for criticism—namely, the impropriety of a public body conferring an office of profit upon one of its own members, and the lack of consideration to others in inviting applications if it is intended to pursue such a course. Regarding the first matter, we believe that it is not unusual for the standing orders of a municipal corporation to provide that no person shall be allowed to be a candidate for any office of profit under the council until at least six months after he shall have ceased to be a member. It would be well if some regulation of this kind were to be added to the standing orders at Fowey.

* * *

The Northampton Institute.

Convinced as we are of the value to many of our younger readers of the courses of technical instruction provided by the several polytechnic and other kindred institutions, we have on many occasions urged their attention to announcements of classes in subjects which are likely to be of interest to them. We have before us a copy of the syllabus of the Northampton Polytechnic Institute, which is situated in St. John-street, E.C., thus being available for those resident in or near the Metropolis. This institute was originally founded as a branch of the old City Polytechnic, which also comprised the Birkbeck Institute and the City of London College. Since the dissolution of the City Polytechnic, however, the Northampton Institute has carried on a separate existence, its work being confined to the provision of classes in technological and trade subjects. The syllabus for the approaching session includes courses in civil, mechanical, and electrical engineering, the avowed object of the instruction being not so much to prepare the student to pass examination tests as to fit him to become a competent worker and thinker in the career which he has chosen. In each department the work consists of lectures, exercise classes, laboratory work, drawing office and workshop practice. The question of the position in which the last-mentioned should be placed in the training of engineers is one which has been very much discussed by both the practising engineers and those responsible for their education. It is on all hands admitted that the trade workshop training can only be given in a commercial workshop, but that valuable introduction to such training can be given in the educational workshop. In the day courses in civil and mechanical and electrical engineering, therefore, the work has been arranged so as to allow of some interlacing of the commercial and educational training.

* * *

A Phillack Councillor and the Surveyor's Grant.

The kind of indignity which municipal officials have to face occasionally was illustrated at a recent meeting of the Phillack (Cornwall) Urban District Council, when a member, Mr. S. James, called attention to a grant voted by the council to the surveyor, Mr. L. W. Chinn. In order that nothing may be lost to our readers of the delicious and delicate taste displayed by the councillor we venture to quote the incident in its entirety from the *Cornish Post*.

Mr. S. James said he had heard great dissatisfaction expressed among the public that Mr. Chinn, the surveyor, had accepted the remaining £10 which had been voted to him for work done in connection with the installation of the water supply. If Mr. Chinn did not refund the £10 although he had been voted that sum by the council he would move that they advertise for a new surveyor.

Mr. Chinn said he would not think of refunding the money.

Mr. James: Then it will be my duty to move a resolution that we advertise for a new surveyor.

The Chairman: You will have to give notice of such a resolution.

Mr. James: I will give notice.

In order apparently that there might be no mistake about the propriety of Mr. Chinn accepting the £10, it will be noticed that Mr. James himself emphasises the position of the council towards its officer by repeating the assertion that the money had been duly voted to the surveyor. In the circumstances, instead of wasting time by discussing the foolish motion of Mr. James it would be more appropriate if the Phillack Urban District Council considered the expediency and desirability of advertising for a new councillor.

* * *

Separation Allowances.

The Maldens and Coombe Urban District Council can scarcely be congratulated on the course they adopted at their last meeting as to their married employees who serve with the colours. As we understand it, one man who left first did so with the knowledge that he would be paid his full wages while serving. Since then nine others have been called up, and it was suggested that they be paid their wages less the army separation allowance of 11s. 1d. per week to the wife. In reply to a question, Mr. R. H. Jeffes, the surveyor, said he thought the arrangement with the first man had undoubtedly influenced those who had since left. It obviously would; but in spite of this the council decided to adopt the suggestion to reduce wages by the amount of the separation allowance. We cannot think the decision was either worthy or patriotic, and in view of the paltry amount involved it may be hoped they will see their way to revise it.

Town Planning Large Areas.*

PART I.—By W. A. H. CLARRY [illegible] Borough Surveyor, Sutton Coldfield
PART II.—By R. A. READ NADIN Town Clerk, Sutton Coldfield

PART I.

[illegible]

MR. W. A. H. CLARRY [illegible]

in respect of the whole of their unbuilt area. The preliminary scheme should impose only a few regulations such as (1) the fixing of the maximum number of dwellings per acre; (2) the fixing of building lines to all existing roads; (3) such modifications of the building lines as may facilitate the scheme; (4) the securing of routes for any new thoroughfare forming [illegible]

This is exactly what the Act should have provided. All boroughs, urban districts, and probably many rural districts, if not required compulsorily to prepare a preliminary planning scheme, should be in a position to schedule the whole of its undeveloped area under a town plan by resolution of the council submitting the plan of the area and resolution for approval by the Local Government Board without a formal public inquiry or the service of notices on owners, lessees, and occupiers beyond an advertisement in the local Press, so that a large amount of the preliminary work and expense, which the existing regulations entail, would be saved.

When the approval of the Local Government Board has been obtained, the district thus protected could be divided into smaller areas as and when they are developed, and the procedure under the regulations could then be taken.

The Town Planning Act of 1909, and the regulations issued by the Local Government Board under that Act, require so much detail, both as regards the information to be supplied and shown upon the many maps, that it has always appeared that it was never framed for very large areas, and yet, if the Act is to be of any practical utility, it must be for towns and districts comprising large areas of undeveloped land, as so little could be done with areas already built upon.

Take, for instance, the borough of Sutton Coldfield, which has an area of 13,030 acres, comprising land already laid out in streets and buildings, and may be considered fully developed, other land in the various stages of development, and a very large area of agricultural land. Directly the Town Planning Act [illegible] the council decided that the borough [illegible] needed the protection and the power [illegible] the Act conferred, and at once began to consider the vexed question of area. [illegible] was made, and an area of 400 or 500 acres, on which building operations were in active [illegible] was selected, this being also an area upon which a scheme, to comply with the Act and regulations [illegible] could be prepared with every chance of success in regard to detail, and without undue expense to the authority.

It became quite evident, however, that there were many other parts of the borough where building was actually taking place, and so the area was enlarged to include land which was at that time considered likely to be developed, say, in the next thirty or forty years. Strange to say, the area was again enlarged at the request of the owners at the statutory meeting.

The very reasons which the owners advanced for extending the area confirms the suggestion of at once making the whole borough or district the area without so many elaborate details and plans. Their contention that the very people you would desire to [illegible] might purchase land outside the area of the scheme, just over the hard-and-fast line, and develop the same in such a manner as to be detrimental to the protected land, is a perfectly sound one, and even now there is not the slightest reason why they should not step over the extended boundary and do so.

Now that this large area has been adopted, a scheme covering every ownership must be prepared so as to govern its separate and joint development almost in detail; whereas it could much more satisfactorily, and with a far greater degree of success, be carried out in units of one or more ownerships when and as the various estates were proposed to be opened out for building purposes.

First of all, the owners must be interviewed separately, and the principal restrictions for the scheme submitted to them. It is useless approaching several owners together, even if their estates adjoin, as each one appears only sufficiently interested in his own land to discuss the questions fully and carefully with any possibility of agreement, and when there are nearly 600 owners to consult the diversity of opinion expressed as to what is necessary to be included in the scheme makes it almost hopeless to obtain a general agreement.

By far the most awkward owner to deal with is the one who possesses a large estate round or near his residence, and who has not the slightest intention of developing any portion of it, and has not the remotest interest in the number of houses per acre, the widths of roads, or whether shops or factories are built, &c. &c., but whose only wish is to be left alone, and to whatever suggestions you make replies, "You ought to submit them to my successor when he is ready to develop the estate"—whenever that may be. It therefore seems impossible when dealing with a large area to make anything but general restrictions governing adjoining estates, and leave the owners to lay out their land in their own way, but subject to the council's approval.

In planning large areas the principal lines of existing roads must be carefully marked on the map, and their improvement by widening and reconstruction considered under the scheme, new arterial roads shown, but whether the cost of these are to be borne by the authority or the owner or jointly is a question for arrangement, and unless the council are prepared to expend a large sum of money the negotiations must necessarily be very delicate.

Under the Sutton Coldfield scheme, whenever an owner deposits a plan for a new street it will be necessary for him to submit a plan showing how he proposes to lay out the whole of his estate; this plan should have all the roads marked on, the probable arrangement of building sites, with the type of house he desires to erect. From this plan it will be possible to judge how the roads will affect the adjoining estates, and also to decide the nature of the traffic the roads will have to carry, and so classify each road for width and construction in accordance with the sheets of sections prepared under the scheme.

* Read as a paper read at the Annual General Meeting and Conference of the Institution of Municipal and County Engineers, held at Cheltenham.

The various classes of roads can only be fore-shadowed by schedule of different sections, which [illegible] the question of how far can the [illegible] at present in force be relaxed. It seems to me clear that small private roads; a step is to reduce the cost of road making, and so bring down the expense of developing, especially [illegible] are projected.

Now this should not be done at the sacrifice of the [illegible] and strength of the road to [illegible] ought to be to avoid [illegible] necessary by the new type of traffic. The only relaxation, therefore, that can be safely made is to [illegible] minimum.

In connection with the laying out of an estate, how [illegible] roads are to be permitted is an important question. Generally speaking, there are great objections to these roads, especially as they have been [illegible] for the last.

In the two schemes which have already received the [illegible] Local Government Board no material deviation from the Streets and Buildings By-laws is contemplated. As regards streets, the only important variation is in the widths of carriageways, and in respect to buildings, while one scheme does not [illegible] the other rather increases the restrictions than otherwise, and includes many important clauses dealing with [illegible] which are not to be found in the [illegible] by-laws.

Allowing [illegible] land to a fixed number of [illegible] to the acre is important in the first instance, to be an easy task, when one is brought in contact with the diverging ideas of the number that different owners have the task is more difficult, and, in my opinion, the only reasonable way this can be done is to limit the larger owners to an average number to the acre extending over the whole of their land, with a maximum number for any one acre, so as to allow as much variation in laying out the houses on their estates as possible, and then to restrict the smaller landowners to a fixed number on their land to conform with the number on those of the larger owners' estates.

Much has been written and heard on the necessity [illegible] relaxing the building by-laws under a town planning scheme, but so far no definite proposals have been made seriously to deviate from the by-laws made under the Model code issued by the Local Government Board, neither have I yet met a surveyor having the responsibility of enforcing the existing by-laws who considers they are too stringent if substantial and healthy houses are to be erected. It is generally overlooked by laymen that building by-laws are framed to control every description of building, and that they are most needed when buildings of an entirely speculative character are being erected, the type of house that is built to-day and sold to-morrow. We may take it that the speculator is quite indifferent to the important matters necessary for the health and comfort of those who are to occupy the dwellings he provides as a rule, with the idea that it is only necessary that the appearance should remain sufficiently attractive until a sale is effected.

It is well known there are many parts of a building not covered by the by-laws, and at the same time there are by-laws which may inflict a little hardship in special cases, but as a whole the existing Model By-laws are the minimum precautionary measures that can be enforced to obtain a proper standard of building, and no relaxation can safely be adopted if this is to be maintained under town planning schemes; probably discretionary powers could with advantage be given to authorities to deal with special cases.

A very delicate point to arrange is the provision and maintenance of open spaces, whether they are to be public or private: it would seem that if parks or laid-out gardens are required they should be provided and maintained at the public expense; small open recreation grounds or playfields may be either for public or private use, and their control should be in accordance with their proposed use in either case.

The one great drawback to open spaces, whether they are playing fields or ornamental grounds, is the maintenance and upkeep; unless this is done by the local authority, or by the employees of the owners of such estates as provide them, they are likely to become a perfect nuisance and a source of annoyance to those living near; it behoves a local authority therefore to be most careful in framing any clauses in a scheme for the provision of open spaces, and to consider whether they are prepared to maintain them or to see that provision that the owners to whom the open spaces are provided are compelled to do so.

PART II.

As soon as the general matters have been fixed upon a provisional area it would be wise to rough out a skeleton plan, on which could be delineated the existing principal roads and the direction in which it would be advisable in the best interests of the district as a whole, having regard to the contiguity of the [illegible]

MR. R. A. REAY-NAPIER

[illegible] constructed in the future. This rough sketch plan would be [illegible] and it is on which to base upon scheme, and would allow in the earliest stages suggestions to be sought for and considered while the ordinary preliminary steps under the regulations are being carried out.

Having mentioned regulations, as one of the first to criticise the original regulations and to point out how they were keeping back town planning, the author desires to express his gratification that the Local Government Board have in the recently issued amended regulations considerably reduced and simplified the various requirements. So much unnecessary work and details have now disappeared, that those authorities which have been hesitating in the past to take up this important work of town planning may [illegible] in the matter. No one can visit the many towns in this country and fail to observe the bad results which have been brought about in the past. It is no use blaming the authorities of those districts; they had not the controlling means in their hands which local authorities now have of preventing these blots, and perhaps in many instances were hampered from lack of means in bringing about alterations and improvements which are always ruinously expensive when attempted to be carried out at the expense of the ratepayers. The extraordinarily rapid growth in many urban districts which has been coincident with the great modern inventions and development of trade consequent thereon, has resulted in hastily-thrown-up neighbourhoods in which every conceivable affront to good taste, and also lack of what is necessary and vital to the health of the community, is manifestly apparent.

Only a well-thought-out and skilfully designed town planning scheme can prevent this same sort of thing in the future, and now that the local authorities have the necessary powers in their hands they ought not to allow the opportunity to pass.

The growth of interest in town planning in every part of the United Kingdom, and also in the Colonies, is most pleasing to those who have taken a keen interest in this truly important subject.

No doubt a good many have recently been reading the interesting report of the Land Inquiry Committee. That committee has rightly concluded that it would be better if the Act of 1909 were amended so as to provide for the making of a preliminary town planning scheme. This should contain certain sufficient provisions to protect the whole of an authority's district and allow of further or more complete schemes

views, with which the author concurs, your time [illegible] contained in the final report of the Departmental [illegible] Having regard to the suggestion that half the cost [illegible] roads, should be contributed by the Exchequer, it [illegible] also for the construction of new roads in such a manner as will permit of a local authority receiving the benefit of the suggested contributions. The [illegible] in means of vehicular transit, has cast an enormous [illegible] That being so, the town planning authority, in preparing a plan, should carefully consider the geographical position of its district in relation particularly to large industrial centres, and should then [illegible] the probable financial effect which would be produced by the increased cost to the ratepayers, on the one hand, on account of making up the additional widths of new roads, or incurred by improving existing roads, and the additional contributions which in the future would be received from the Exchequer for their maintenance on the other. It must not be forgotten that the expenditure for improvements of roads of the above classes is a proper and suitable object for grants from the Road Board

LOAN PERIODS.

LOCAL GOVERNMENT BOARD INSPECTOR'S PROTEST.

On Friday last Mr. H. R. Hooper conducted an inquiry on behalf of the Local Government Board [illegible] an application of the York Corporation for sanction to borrow £1,625 for the purchase of land and houses in Foss Islands for the extension of the depot. The value of the land was estimated at £300, and the town clerk said they wanted the loan for as long a period as the Local Government Board would allow.

The inspector: Haven't the council considered it? Why should they throw the responsibility for the management of their finances on the Local Government Board? If this were granted for sixty years, it would mean that this piece of land, valued at £300, would cost the ratepayers before they were finished with it £1,000 in interest. Local authorities should be anxious to get these little amounts paid off in a few years, and not run them on over an enormously long period. If the whole purchase—£1,600—were paid for in one year it would not cost more than a penny rate.

Ultimately it was agreed to ask for a period of twenty years.

Sewage Sprinklers.—Tenders of the Ames Crosta Sanitary Engineering Company, Limited, Nottingham, have been accepted for the two 50-ft. diameter rotary sprinklers required at Spondon sewage works, and at Breaston and Draycott sewage works the firm's tender has been accepted for three 54-ft. diameter sprinklers, all of the well-known "Simplex" type. The company have received a repeat order for two additional patent "Simplex" rectangular travelling sprinklers from the Birmingham, Tame and Rea District Drainage Board.

WATER SUPPLY IN THE RAND.

VAAL RIVER SCHEME.

The [illegible] of carrying out a much needed extension of the [illegible] supply at the disposal of the Rand Water Board [illegible] in the last annual report of that authority.

Surveys and investigations made by the chief engineer, Mr. W. Ingham, M.Inst.C.E., M.I.Mech.E., showed that for a supply of not more than 10,000,000 gallons a day the best scheme, from the point of view of capital expenditure and working costs, was Knilfontein on the Zuikerboschrand River, in the Heidelberg district. But the catchment area being only 340 square miles, and the scheme being incapable of extension beyond the quantity mentioned, the board decided to seek elsewhere a more suitable site for the proposed works. The next scheme in order of preference as regards capital and working costs, is that known as the Mount Arabel scheme, which is also in the Heidelberg district, the site of the dam being below the junction of the Bleshok and Zuikerboschrand Rivers. In this case the catchment area is about 1,000 square miles, including that of Knilfontein, and would probably yield a supply of 20,000,000 gallons a day, after allowing for a succession of three dry seasons. The board was at first disposed to adopt this scheme, but the further investigations made and the more detailed particulars obtained by the chief engineer regarding the annual rainfall, evaporation and run-off, the possibility of dams being built on the far East Rand section of the catchment area, the mineral prospects of the district, the extent of the farming operations carried on, and the probability that these mining and agricultural interests would be prejudicially affected by a large water scheme, weighed against the advantages of the scheme, and so the board finally determined to reject it.

The possibility of the economic use of the Vaal River as a source of supply was then considered. Mr. Ingham had previously reported on four sites on this river where a dam could be erected, namely, Koppiesfontein, Englebrechts Drift, Kaffirs Drift, and Lindequees Falls—but the three first mentioned were situated too far away from the Rand and from the nearest coalfields to be economically possible for the board's purposes. Having, however, consulted with the Director of Irrigation for the Union, the chief engineer was able to formulate a scheme by which water could be impounded at Koppiesfontein, and from there passed down the natural channel of the river to Vereeniging, a distance of about 47 miles, and caught up at the latter place by a small weir, and from there pumped to the Rand. If this scheme were adopted the board was given to understand that it would be given legislative powers by which it would be enabled to prevent the unlawful use of the water by other persons, and to protect the board's property in the water in its passage down the river. Although, theoretically, this scheme was open to no greater objection than any other river scheme which might be adopted, the board considered that, in practice, difficulties would inevitably arise, and this view was upheld by a leading South African counsel to whom the question was submitted for opinion.

Before finally coming to a decision in this matter, further investigations were made by Mr. Ingham with the object of ascertaining whether some other site, suitable from the engineering and financial points of view, could not be located on the Vaal River from which water could be pumped direct to the Rand, instead of, as in the Koppiesfontein project, impounding it at one place and abstracting it at another many miles away. The chief engineer accordingly made a very careful survey of the long stretch of river between Villiersdorp and Parys, a distance of 147 miles, and having collated and compared the data so obtained, he found that the direct pumping scheme which could be carried out and worked at the lowest cost, and which would be unobjectionable from the engineering point of view, is that referred to as the Lindequee scheme. As regards capital expenditure, this scheme is estimated to cost about £7,200 more than the Koppiesfontein-Vereeniging scheme, but considerably less than any other Vaal River scheme considered; the working expenses, however, will be lower than any of the other Vaal River schemes referred to. The catchment area is about 17,200 square miles, as against 7,620 square miles in the case of Koppiesfontein, and there is the further advantage

of being able to pump direct from the reservoir at Vereeniging, which is the nearest point of the Vaal River to the Rand, and where coal is cheap and abundant.

Having carefully considered and compared the merits of the schemes mentioned above, the board came to the conclusion that for a permanent and reliable supply of from 10,000,000 to 20,000,000 gallons a day, obtainable at a reasonable cost as to capital expenditure and working expenses, the Lindequee scheme appeared, in all the circumstances, to be the most suitable for the board's purposes. The selected site is situated about 2½ miles below the Vereeniging Railway Bridge and some 15 miles in a direct line above the small town of Parys. The impounding structure which it is proposed to erect is a barrage, which will not only be cheaper than a masonry dam, but will possess the additional and important advantage of being more suitable for controlling the heavy floods which sometimes occur in the Vaal River. Structures similar in design to that proposed by the board have been used on Indian rivers and elsewhere in recent years, and have been found eminently satisfactory. Contrary to the usual practice in such matters, it will be necessary to pump at a point about 17 miles below the upper end of the reservoir instead of from the barrage site. Thus, however, will not be attended with any real difficulty, as it appears that the fall in the level of the river-bed between Vereeniging (where the pumping station is to be situated) and the barrage at Lindequee is comparatively small, being only 8 ft. over the whole distance of 22 miles. The cost of the whole scheme is estimated at £1,146,700, exclusive of the cost of raising the fresh capital required.

ROAD IMPROVEMENT IN BO'NESS.

By J. LOUDEN,

Burgh Surveyor.

Our efforts during the past three years have been directed to experimenting on our roads with a view to ascertain the most satisfactory and economical method of improving the surface of macadamised roadways.

Selected portions of our roadways, both on the higher and lower reaches of the burgh, were treated in the following manner:—

(*a*) Tar-spraying the surface and dusting with whin chips.

(*b*) Coating the roadway with machine-broken whinstone metal, dry rolled, bound with ¾-in. tarred gravel, and rolled until thoroughly consolidated.

(*c*) A primary coat of 2-in. tarred metal covered with a coat of ¾-in. tarred gravel.

(*d*) Coating the whole surface of the roadway with tarred aggregate metal composed of 2-in. whinstone metal mixed with 25 per cent of gravels ranging from ¼-in., ¾-in. and 1½-in.

(*a*) and (*b*) were adopted on the higher or residential districts of the burgh, where the traffic is light or moderate.

(*c*) and (*d*) were laid on the low-lying roads, where there is considerable traffic.

A careful note of the cost of each method, including labour, materials, &c., was kept. These are given in the accompanying table, as also the increased cost over the ordinary method of laying water-bound macadamised roads.

As a result of those experiments, tar-spraying for the roads with light traffic, and coating with tarred aggregate metal for the low-lying roads subjected to heavy traffic has been adopted as giving the best and most economical results.

Last year further sections of our roadways were treated in the above-mentioned manner, and so far the results have given satisfaction.

The cost in the case of the tarred aggregate method worked out at 2s. 4d. per super. yard, including tar-spraying surface. The extra cost thus incurred included the strengthening of the sub-crust of the roadway.

As a substitute for tar in spraying the surfaces of the roads, I have adopted the use of Fluxphalte this year. This material, it is anticipated, will form a better carpet for the roadway, and give a more lasting surface. I cannot yet, however, speak of this material from experience.

The initial cost in covering the surfaces of our roads in this way is greater, but the yearly maintenance, in my opinion, would not greatly exceed the old method, provided, of course, there is no excessive increase in the cost of materials.

BO'NESS ROADS: COMPARATIVE COSTS.

Date of laying each section.	Reference letter of method referred to.	No. of superficial yards.	Cost of ordinary method.	Extra cost of new over old method.	Rate per superficial yard, old method.	Rate per superficial yard, new method.	Remarks.
			£ s. d.	£ s. d.	d.	s. d.	
June, 1911	Method A	6,791	275 18 6	42 8 9	9½	11½	The extra cost over the ordinary method is 1·5d. per super. yd. With moderate traffic this section presented a good surface for two years. This method has been extended, a total of 14,624 super. yds. having been laid. When recoating the road the best results are obtained by binding the metal with chips and tar spraying thereafter.
July, 1911	Method B	2,342	94 18 0	19 10 4	9½	11½	The extra cost involved equals 2d. per super. yd. The top coating was found to be too fine, and the surface was broken up during the first winter.
August, 1911	Method C	1,441	67 10 0	33 3 10	11	1 4½	The metal used in the old method for this section was hand broken, and the price per yard is consequently higher. This section has been sprayed each summer since it was laid down and still presents a good surface.
July, 1912	Method D	1,400	162 12 0	130 15 0	8½	1 4	This section was tar-sprayed last summer, and during the past winter, in spite of considerable traffic, there was almost an entire absence of mud, and the surface is still very good.

Oilcans.—In addition to 7,000 of their patent seamless oilcans recently delivered to the Navy, Messrs. Joseph Kaye & Sons, Limited, Leeds, have now received orders from the War Department for the immediate delivery for 3,000, making 10,000 in all.

Waterproofing of Cement.—The waterproofing of cement tanks and swimming baths is naturally of the first importance, and many architects have given very favourable reports indeed of the efficacy of Pudloed cement in this direction. Among the latest swimming baths to be treated is one at Kirkham (Lancs).

A Glossary of Road Terms. By H. Percy Boulnois, M.INST.C.E. St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, E.C. Price 2s.—Mr. Boulnois has achieved far more than he may imagine by this production of his pen. He set out to standardise the nomenclature of road terms; in addition he had made a valuable addition to English literature. To the untutored it is like reading a new language; Mr. Boulnois says it isn't anything like "complete." At any rate, it is a valuable *vade mecum* which no one has attempted before.—*Portsmouth Times.*

Institution of Municipal and County Engineers.

THE CLEETHORPES MEETING.

All [illegible] Institution of Municipal and County Engineers to Cleethorpes on the Lincolnshire coast [illegible] was quite up to the expectations of either the surveyor, Mr. Waithman, or the entertainments committee, Mr. J. S. Pickering (Cleethorpes), president, was in the chair, and there were present [illegible] (Newcastle), E. J. Silcock (Westminster and Leeds), J. S. Alford (Westminster), E. Picker (Beverley), H. Gilbert Whyatt (Great Grimsby), W. Wainwright (Hessay), E. H. [illegible] (Hinckley), hon. district secretary, C. H. Waithman (Cleethorpes), R. H. Jenkins (Skegness), O. Hellawell (Willington), T. Waddingham (Grimsby), H. Dearden (Deeping), J. Hinge (Lincoln), J. H. Dyer (Wath-on-Dearne), T. P. Frank (Newark), F. W. Wright (Ilkeston), T. Palmer (Lincoln), D. M. MacBrair (Lincoln), F. Rodgers (Gainsborough), J. Dudley Robinson (Worksop), secretary, S. M. Mason (Grimsby), E. W. Turner (Cleethorpes), L. W. Pye (Cleethorpes), T. L. Moore (Skegness), G. T. Paget (Gainsborough), J. McKie (Cleethorpes) and J. W. Houghton (Cleethorpes).

Alderman W. GRANT, chairman of the district council, said it was his pleasing duty to give them a hearty welcome to Cleethorpes. He had watched the growth of Cleethorpes, and had done his best during the past twenty years to make it what it was.

The PRESIDENT (Mr. J. S. Pickering), in acknowledging the welcome, observed that the reputation of Cleethorpes as a health and pleasure resort would under normal conditions undoubtedly have attracted a much larger number of their members that day. He need, however, scarcely apologise for the small attendance at a time when their country and other [illegible] sympathy with them were passing through such great trials. He thought they would agree that it was essential to the health of the community at large that the work of sanitary authorities should, as far as possible, continue and thanks to our insular position and maritime supremacy, they were able to carry out these important works in comparative safety. The Cleethorpes council was apparently one full of enterprise, and as an institution they appreciated a local authority whose object was the health and welfare of the community. He was quite sure their visit would be both pleasurable and profitable to them, and that their pleasure would be greatly enhanced by the hearty manner in which they had been received.

The president announced the following apologies for inability to attend the meeting: Messrs. E. G. Mawbey (Leicester), W. J. Hadfield (Sheffield), E. B. Martin (Rotherham), F. O. Kirby (Doncaster), T. Henry (East Retford), H. W. Smith (Scarborough), F. R. Ryman (Stamford), and C. F. Hodgson (Otley).

Mr. H. GILBERT WHYATT stated that he had received a letter of apology from Mr. Purnell Hooley, of Nottingham, who was on duty with the Territorials, and Mr. J. Horton, of Derbyshire.

THE MUNICIPAL WORKS OF CLEETHORPES.

By CHAS. H. WAITHMAN, ASSOC.M.INST.C.E.

Cleethorpes is situated at the mouth of the Humber, immediately opposite Spurn point, and adjoins the county borough of Grimsby. The town derives its name from "Cleis" and "Thorpe," Cleis being the Celtic prefix meaning chalk and Thorpe the Saxon for village or hamlet. Cleethorpes remained a civil parish until 1873, when the Cleethorpes-with-Thrunscoe Local Board was formed, and became an urban district in 1894. The progress of the town was slow up to 1885, and it was not till 1896 that real development and improvement was commenced, since when it has continued to increase in size and importance as a health resort. Geologically it is almost entirely upon [illegible] boulder [illegible] with erratic layers of soft warp, [illegible] and [illegible] peat with chalk beneath, at an approximate depth of 80 ft.

GENERAL STATISTICS.

The area of the urban district is [illegible] high-water mark, 1,184 acres; between high and low water mark, 901 acres; total, 2,085 acres.

The increase which has taken place in population and rateable value is as follows:—

Rateable Value. £	Date.	Population.
8,087	1881	2,747
11,876 ...	1891	4,596
17,700	1901	12,578
26,100	1911	21,417
34,750	1914	24,000

During the summer months there is a very large influx of visitors, as many as 50,000 on a Bank Holiday. The death-rate for the year ending December 31, 1913, was 10·4, and the birth-rate 25·9 per 1,000. The total indebtedness of the council at the present time is £115,000. A 1d. rate produces £347.

HIGHWAYS.

There are 18 miles of road repairable by the council, their construction being: Granite paving (tramways), 2·5 miles; granite tar-macadam, 9·5 miles; tar-macadam, 6 miles; total, 18 miles. The granite paving which is maintained by the Great Grimsby Street Tramway Company consists of Norwegian granite setts on 6-in. Portland cement concrete. The materials used in macadam construction are Quenast, Rhenish basalt and whinstone, from each of which good results have been obtained.

Tar-macadam construction has been carried out with tarviated Inverkeithing granite, tarred Kinton-Lindsey limestone, Frodingham and Wellingborough slag and Derbyshire limestone. The latter bottoming, graded 1-in., 1½-in. and 2½-in., topping ¾-in., subsequently tar-painted, has given the best results. In 1912 the author reconstructed Tiverton-street, using 2-in. dry whinstone granite, bound with ¾-in. tarred limestone, surfaced with ¾-in. topping, and tar-painted. This road, which is subject to a considerable amount of traffic, is in excellent condition. The cost was 2s. 8d. per yard super.

TAR-PAINTING.

A considerable amount of tar-painting is carried out each year. In 1913, 150,384 yds. super. were done, the method of applying being with the Cantar spraying machine and the author's reservoir tar broom. Excellent tar is obtained from the Cleethorpes Gas Company at 3½s. per ton (2d. per gallon). An abstract of the cost of last year's work is as follows:—

Total cost.	£	s.	d.	*Cost per sq. yard super.*	d.
Labour ...	95	6	4		
Team labour ...	81	13	4	Labour .	·19
853 tons tar at 35s.	149	3	9	Tar .	·22
295 tons slag chips at 5s. ...	74	17	6	Slag chips ..	·15
Total ...	350	0	11	Total ...	·56

1 ton of slag chips covers 125 yards super.
1 ton of tar covers 1,760 yards super.
1 gallon of tar covers 5·5 yards super.

SCAVENGING, STREET WATERING, ETC.

The urban area is divided into six districts, each district having three sweepers and one man with handcart. All main roads are scavenged twice each day, other roads once.

For the purposes of street watering the district is divided into three: main roads are watered three times daily, other roads twice.

All repairs and maintenance work is carried out by direct labour. [On p. 385 is a summary of the cost of highway maintenance during the last five years.]

SANITARY AND BUILDING—BY-LAWS, ETC.

The building trade in the district is very active, and during the year ending December 31, 1913, plans were passed for 223 new houses and over 100 for alterations and extensions. The by-laws in force were approved by the Local Government Board in 1904. The framing of new by-laws is engaging the attention of a sub-committee at the present time. Much [illegible] has from time to time taken place

in connection with the erection of "sheds and temporary buildings," and a standard specification has recently been adopted, as a result of which it is hoped that the erection of certain buildings which inevitably become a nuisance will be prevented. The principal points now under discussion by the sub-committee are as to the thickness of walls, the height of rooms (with a special reference to the room in the roof and the attic), impermeable concrete for sites and foundations.

STABLES AND HIGHWAY DEPOT, ETC.

The council have at the present time fourteen horses, six for highway purposes and eight for the collection of house refuse. The stables and depot are situated in Poplar-road, and are adjoining the refuse destructor and pumping stations, while the fire station is situated in the depot yard itself.

FIRE BRIGADE.

The brigade is a voluntary one and consists of fourteen members, the equipment being: Poplar-road fire station—Merryweather's Gem fire engine (pumping capacity 350 gallons per minute); first-aid auto-car, with smoke helmet, &c.; hose cart; fire escape. No. 1 sub-station, Yarborough Hotel—Hose cart. No. 2 sub-station, Barcroft-road—Hose cart. Fire-escape station, New Cleethorpes, Blundell-avenue.

The district is well provided with fire hydrants, and attention is always given to this matter when new streets are being laid out. In July, 1912, the brigade, competing at Spalding against others of

CLEETHORPES PROMENADE.

the North-East division of the Fire Brigades Union, won the silver cup for steamer drill.

PARKS AND RECREATION GROUNDS.

Sidney Park, situated on the south end of Cleethorpes, is 12 acres in extent, and contains a large model yacht pond, bowling greens, tennis courts and croquet lawn, park-keeper's lodge, shelters and greenhouses. There is an extensive and elaborate flower garden, which, with the Kingsway Gardens, is under the superintendence of a head gardener and a staff of nine men. The park was the gift of the Sidney Sussex College, and was opened in 1904, the cost of laying out, &c., being £5,000. The Sidney Sussex College have recently given a further 6 acres for park extension and 8 acres in the central ward for a recreation ground.

METEOROLOGICAL STATION.

In 1909 the council equipped a meteorological station, where daily records are taken. The station comprises the following instruments: Barometer, dry and wet bulb hygrometer, maximum and minimum thermometers, anemometer, rain gauge, and Campbell-Stokes sunshine recorder.

ESTATE DEVELOPMENT, PRIVATE STREET WORKS, ETC.

The Private Street Works Act, 1892, was adopted in 1893, since when upwards of fifty roads and back ways have been made up. The average cost has been at the rate of 15s. per foot frontage, or 7s. 6d. per yard super., for 36-ft. roads. There are at present three important estates in course of development—the Cleethorpes Boulevard estate, Hey's estate, Sidney Sussex College estate. The latter estate is about 600 acres in extent, and 1 mile 184 yds. of new roads have been made by the estate and taken over by the council during the last seven years, while 1½ miles have been made up and dedicated by the Boulevard estate in the last seven years. The work is carried out in accordance with the council's specification and requirements, after which the street is formally inspected and subsequently adopted. The council's specification provides for the following construction and materials: Carriageway for 36-ft. and 30-ft. roads—12-in. chalk foundation and 4-in. tar-macadam; for 8-ft. and 12-ft. back roads—8-in. chalk foundation and 4-in. tar-macadam. Kerb and channel

Year.	Mileage.	Maintenance, repairs, improvements.	Scavenging and watering.	Total.	Rate per mile maintenance.	Rate per mile scav., &c.	Total rate per mile.
	M. F. Y.	£ s. d.	£ s. d.	£ s. d.	£	£	£

corners should be to a radius of 30 ft. to the outside edge of the kerb and in side thoroughfares 18 ft. Radius kerb (12 in. by 6 in.) and channel (10 in. by 6 in.) to be of an approved granite. Straight kerb (12 in. by 4 in.) and channel (10 in. by 6 in.) to be of approved hard York. All to be laid on 6 in. of Portland cement concrete (8 to 1). Footways to be laid with concrete slabs 2 in. thick from certain approved firms. Sewerage.—Certain patent jointed pipes are specified for use in good and bad ground. Gully connections and builders' junctions are to be put into the back edge of the footpath in the same class of pipe as the sewer. Manholes and flushing chambers to be constructed in accordance with details supplied by the surveyor. No building is allowed to be commenced in any new street until such street has been staked out according to approved plan and section.

TOWN PLANNING SCHEME.

The author is now engaged upon the preliminary details of a town planning scheme, the scheduled area comprising, approximately, 10,000 acres, and embracing parts of the county borough of Grimsby and the Grimsby Rural District Council.

IMPROVEMENTS.

Of the many improvements carried out during the past fifteen years, the construction of the Kingsway and promenade must rank first and foremost. The work was carried out under the direction of the author's predecessor; initiated in 1901, commenced in 1903, it was completed and formally opened by Lady Henderson on July 12, 1906.

In 1902 the council successfully promoted a Bill in Parliament known as the Cleethorpes Improvement Act by which powers were obtained to reclaim some 4 acres of the foreshore, construct a sea wall, promenade and other works; also to levy an improvement rate of 2s. 6d. in the £ on property fronting the Kingsway, 1s. on property in the side streets running off Kingsway, and 6d. on property in a certain area at the rear. The wall, which is of concrete, is 2,000 ft. in length and 18 ft. high, with a 3-ft. 6-in. moulded parapet wall above it. The wall is 7 ft. thick at the base, tapering to 2 ft. at the promenade level, with a batter of 1 in 4½ on the sea side. The wall was built by means of shutters. Shutters, 30 ft. long, were placed upright, and from the temporary railway overhead concrete was tipped. Some 15,000 tons of concrete were used, and 100,000 cub. yds. of sand for filling behind the wall.

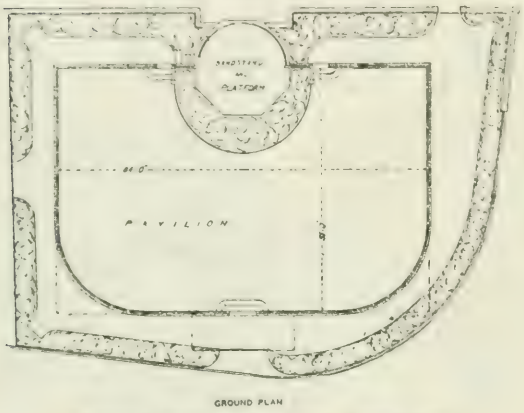
The Kingsway consists of a 30-ft. tar-macadam carriageway and a 20-ft. promenade between which is a 10-ft. width laid out as a flower garden. Details of the various contracts were as follows: Sea wall, filling, &c., £15,673; roadway, sewers, footpath, &c., £14,813.

[illegible] £2,261 gardens, rockery, planting, &c., £482; shelters and seats, £1,265; total, £24,422.

Other improvements which have been carried out by the author are as follow:

KINGSWAY PAVILION.

The bandstand was erected in 1913 together with an open-air enclosure. In connection with this, which was the first step towards providing any form of entertainment on the Kingsway, a concert party was engaged during the week, the council themselves providing sacred concerts on Sundays. So successful was this undertaking that at the close of the season of 1913 it was decided to cover in the enclosure, and the author was instructed to prepare a scheme. The tender of the Falkirk Iron Company was accepted in the sum of £908 17s. 6d., the wind-screens, brick-



Proposed Kingsway Pavilion, Cleethorpes.

work, &c., being tendered for locally. Details of the complete cost are: Falkirk Iron Company (including Pennycook's patent glazing for roof), £908 17s. 6d.; wind-screens, £335; stonework, £45; brickwork, £62 10s.; painting, £50; planting, &c., £50; preparation of foundations, £50; total, £1,501 7s. 6d.

UNDERGROUND CONVENIENCE.

Male.—Accommodation of eighteen urinal stalls and five water-closets, store, &c., is provided. The floor level is 4 ft. 3 in. below the adjoining ground level. This level was governed by the invert depth of the Kingsway sewer. Interior lined with glazed bricks; water-closets divided by the Shepwood patent partition; roof of Mellowe's patent glazing. The cost was £500, exclusive of direct labour in connection with entrances, planting shrubs, &c.

SHELTERS.

Two new shelters were erected on the Kingsway in 1913, and were designed to include a small shop; from each of which a rental of £15 per annum is derived. The cost of each shelter was £150, but the Local Government Board excluded from the amount sanctioned the cost incurred in connection with each shop.

PIER-APPROACH SHELTER.

This improvement was carried out at the beginning of 1913, and provides shelter accommodation for about 800 persons, while a lavatory is provided at one end and cloak-room at the other. The elevation is in terra-cotta, the roof in reinforced concrete. The cost of the work was £500.

PIER, PROMENADE AND FORESHORE.

The promenade, from end to end, is 1½ miles in length, of which two-thirds is owned and maintained by the Great Central Railway Company, who also own the pier, pier gardens, Highcliffe Gardens, together with numerous shops and restaurants along almost the entire frontage. The urban council own the rights of the foreshore, and an income of £1,000 per annum is derived from the rents of stalls, hire of chairs, &c.

GROYNES.

The groynes along the front of the Kingsway were constructed on the advice of the late Mr. W. T. Douglas, M.Inst.C.E., at a cost of £570. They are 800 ft. and 400 ft. in length. It was anticipated that they would be the means of collecting sand along the wall, but in this respect they have failed to achieve their object. At the end of 1912 the author carried out experimental works at the south end of Kingsway. One 800-ft. and one 400-ft. groyne were removed, and two short groynes, built up at the land end, were constructed at an angle of 30 degrees further south, and by this means it was hoped that sand would collect; but while the sand which formerly remained outside the 800-ft. groyne has extended inwards, there has been nothing in the shape of an accumulation against the wall.

PUBLIC CONVENIENCES.

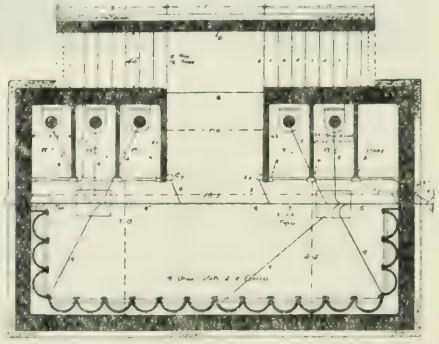
Conveniences for both sexes were constructed in Sea-road in 1907. For females seven water-closets with lavatories and cloakroom provided, and for males eleven urinal stalls and six water-closets, lavatories and cloakrooms. Public conveniences are provided for both males and females on the Thrunscoe Pleasure Grounds (males, three water-closets, seven stalls; females, four water-closets), a ladies' lavatory on the Kingsway (four water-closets), conveniences (male and female) in Sidney Park (males, three water-closets, seven stalls; females, three water-closets), underground convenience (male) in Brereton-avenue (two water-closets and six stalls), and, as already described, underground convenience (male) on Kingsway. In addition to these the Great Central Railway have provided accommodation on their promenade.

STREET LIGHTING.

The streets are lit throughout under contract by the Cleethorpes Gas Company. There are 410 lamps, divided up as follows: 375 single-burner ordinary incandescent, 14 high power, 21 multiple-burner high power.

ELECTRICITY UNDERTAKING.

In 1912 the council initiated an electricity undertaking; the supply is obtained under contract from the Great Grimsby Tramways Company, at the power station, which they lease from the council.



PLAN

Kingsway Convenience, Cleethorpes.

At present an area in the North Ward only is cabled, and in connection with this loans were sanctioned as follows: Cables, £3,914; services, £456; meters, £130.

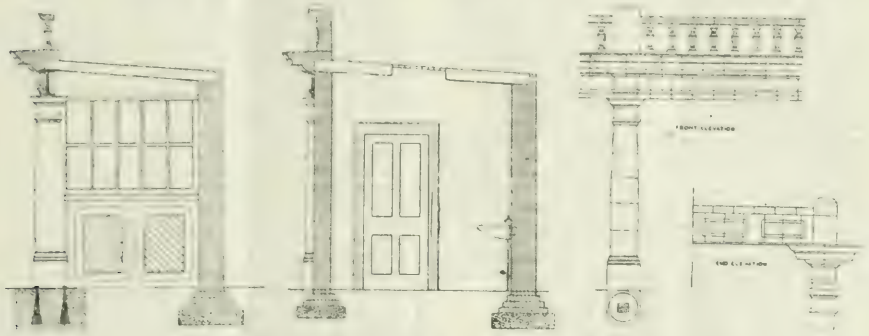
The cables laid are of the vulcanised bitumen type, and are laid on the three-wire distribution system,

giving a pressure of 230 volts on either side, 460 volts across the two outers, laid in earthenware troughing filled in with bitumen, and protected on top with tiles of 1 in. thickness. The total length of cables laid is 4,197 yds.

REFUSE DESTRUCTORS.

Although refuse destructors are so frequently mentioned in the papers submitted at the various meetings of the institution, the author, while avoiding comprehensive details of the Cleethorpes destructor, feels that there are some points in connection with the scheme, and particularly with the Local Government Board inquiry, that may prove of interest, together with the fact that in inspecting the work the members will have the opportunity of seeing an up-to-date plant at a very interesting stage—viz., one two-cell unit completed and the other partially completed.

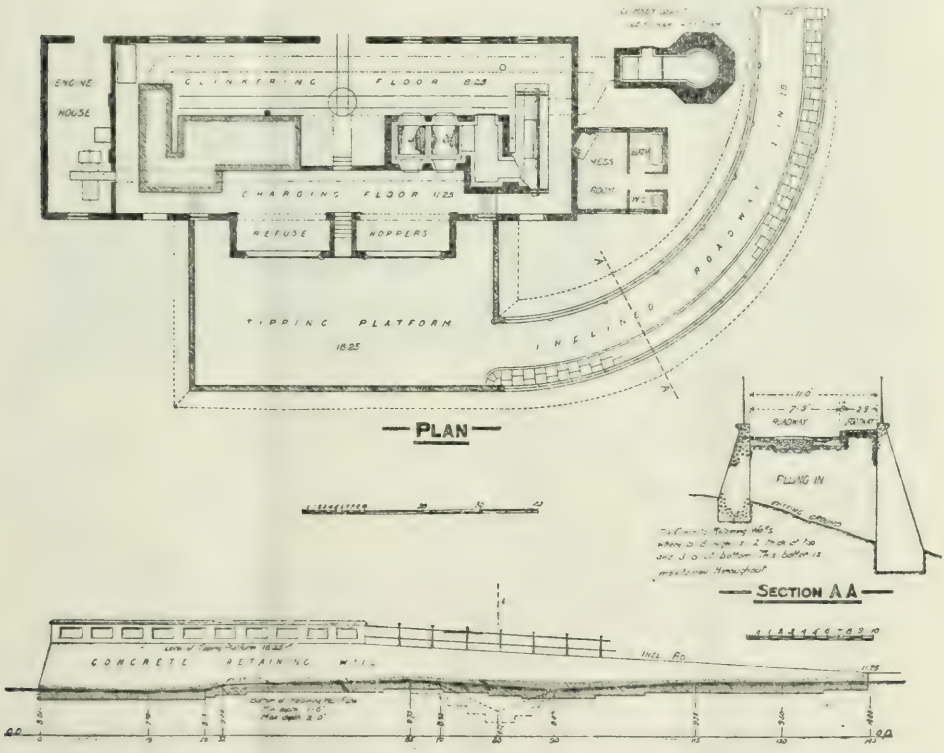
The original scheme, which was prepared by the author in 1912, was for a three-cell back-fed destructor, provision being made for a one-cell extension, the estimated cost being £4,000. Application was made to the board accordingly, and as the result of the inquiry the board asked for (*a*) The construction of two separate sets of furnaces, with provision for a one-cell extension to each; (*b*) an increase in the height of the chimney shaft from 100 ft. to 125 ft.



Cleethorpes Pier Approach Shelter Details

(*c*) the construction of the inclined roadway in either brickwork or concrete. An amended scheme embodying the requirements was submitted, and was sanctioned by the Local Government Board, and the tender of Messrs. Manlove, Alliott & Co., in the sum of £6,500, accepted. The site selected is admirably situated, being central, easy of access, and adjoining the council's depot, yard, pumping station, &c.

With regard to the utilisation of the steam generated at the destructor for sewage pumping, this matter was



Cleethorpes Refuse Destructor: Inclined Roadway and Tipping Platform.

[illegible] reported upon by the author and Mr. [illegible], but, having regard to an [illegible] circumstances, it was not thought that it would be [illegible] a precedent on an extensive scale to adopt [illegible], however, to use the steam in connection with the [illegible] of tar macadam and concrete [illegible].

The [illegible] is a [illegible] [illegible] and [illegible] [illegible] [illegible]

made himself with the vote of thanks to the author of the two papers. He was more especially interested in the paper by Mr. Wortham. A question as to the quality and hardness of the stone was one point he would like to have had, and that was whether different stone was used. The cost of repainting at the end of ten years was very reasonable indeed. With regard to the figures of the cost of the work, he thought they were hardly to be taken as a standard because they included improvements. He would like to know what standard pressure the engineer worked to in testing buildings. Every authority was different as to the standard. He considered that three times the working pressure was sufficient to ensure safety. He found nothing in the paper about water. It rather seemed to him that water was dealt with in too little a space. He would like to know whether water was drawn in Cheltenham.

(To be concluded.)

During the afternoon the members made a tour of a number of the undertakings described in the papers read at the meeting, and on their return were entertained to tea at the Cliff Head by Mr. Wortham.

BEACH PAVILION AT EAST LONDON.

The reinforced-concrete pavilion illustrated in the accompanying photographic view is a new feature of the sea-front at East London, South Africa. The building, which has been carried out by Mr. J. Powell, [illegible], is situated on the land side of the esplanade.

The internal dimensions of the ground and first floors are 112 ft. by 40 ft. by 14 ft. high. The roof of the building is practically flat, and the whole, excepting the houses over the staircase wells, the tops of which appear in the photograph, is used as a roof garden. The floor space, including the roof garden, is about 15,000 sq. ft.

East London Beach Pavilion.

The whole of the reinforcements were supplied by the Trussed Concrete Steel Company, Limited; the staircase railings, lamp pillars, newels, cast-iron gutters, downpipes, and palisading were supplied by Messrs. Walter Macfarlane & Co., Glasgow; the electric lighting was carried out by a firm of local electricians, and the joinery made by local builders. Otherwise the building was constructed departmentally, and cost £1,700.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, **for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the** St. Bride's Press, Limited.—*Liverpool Courier.*

Sea Wall Wrecked.—Much damage was caused on the Holderness coast during Sunday and early on Monday morning by the gale and the high spring tides. Thousands of tons of cliff have been washed away, and at Withernsea the new sea wall promenade now in course of construction was wrecked. Fifty yards of concrete wall and thousands of tons of filling were washed away. The damage is estimated at £1,000.

CORRESPONDENCE.

Each man's opinion freely is his own
Concerning anything, or anybody.

MASSINGER: "The Fatal Dowry," Act II. 2

THE UTILISATION OF REFUSE.

To the Editor of THE SURVEYOR.

SIR,—As I understand that the Development Commissioners have asked county councils to prepare schemes for the reclamation and cultivation of waste lands, and proprietors of such lands have been requested to communicate with agricultural colleges, I take the liberty to ask you kindly to publish in your accredited columns the following notes, which may be of use to persons and corporations concerned.

The easiest and most natural way of reclaiming waste lands is by giving back to the earth what came from the earth—*i.e.*, by digging into the soil our daily refuse.

This system has been in use in China from time immemorial, and without it it would have been impossible to feed the enormous population of 400,000,000 of inhabitants contained within the relatively restricted area of China proper. The same system is followed in Belgium, Scotland, some parts of England and France, and other agricultural countries.

The system, however, of digging into the soil crude house and town refuse is subject to three main disadvantages—(1) soiled paper and light refuse are liable to be blown about by the wind, and protests against this nuisance, if nothing stronger, have been lodged against municipal authorities in Scotland and elsewhere; (2) crude house and town refuse, if left about in heaps or even when spread out, gives a disagreeable, nauseating and unhealthy smell; (3) however deeply house refuse is dug into the soil, such substances as broken glass and crockery have a knack, after the soil has been ploughed, of coming to the surface, disfiguring the land, and causing injury to the horses and cattle, and even to men.

All these disadvantages can be eliminated at once by passing the refuse through a machine called the "Patent Lightning Dust Manipulator," which is a specially constructed disintegrator and mixer combined. The refuse thus treated is reduced to a uniform mass of the appearance and consistency of mould, from which it is scarcely possible to distinguish it. The whole of the substances composing the refuse are thoroughly amalgamated, so that there remains no soiled paper or other light material to fly about. The refuse is also deodorised by the action of the machine, the only smell that it gives being like that of earth, and the pieces of glass and crockery are reduced to a harmless powder. Tin and iron utensils and boot leather are sold separately at a good profit.

This mould contains, besides a certain percentage of lime, the three plant foods necessary for the fertilisation of the soil in much greater proportions than farmyard manure. A chemical analysis and report by the East Anglian Institute of Agriculture gives the following comparison between house refuse manure passed through a Patent Lightning Dust Manipulator and farmyard manure:

	lb. of nitrogen.	lb. of phosphate.	lb. of potash.
1 ton of good farmyard manure contains	10-15	19-23	10
1 ton of house refuse manure contains ...	18	52	11

It is true that the nitrogen in house refuse manure is more slowly absorbed by the soil than that of farmyard manure, but, on the other hand, the latter is more apt to deteriorate owing to the great amount of moisture in it, and the action of refuse manure lasts much longer—over two or three years.

The above-mentioned treatment reduces house refuse to about two-thirds of its original bulk—a valuable consideration in the calculation of transport.

Another advantage is that house refuse manure can be stored in heaps in the open, as it very quickly forms an oxidised crust which soon becomes practi-

[illegible] and on which flies do not alight. [illegible] know what a source of flies farmyard manure is.

The [illegible] refuse to a presentable condition is no longer a novelty, a number of municipal corporations—such as Southwark in London, Halifax, Bispham-Blackpool, Hove, Glasgow, &c.—having had it in use, some of them for some years. The Metropolitan Borough of Southwark [illegible] its plant after a year's trial, and now the Corporation of Hove have passed a resolution to quadruple theirs.

The plant takes very little room, is relatively inexpensive, and causes no nuisance of any kind.

Were this mould, without the addition of any other [illegible] of any earth, spread 2 ft. or 3 ft. deep, not only over poor land, but even on bare rocks, it would at once give a fertile soil fit to grow any crop.

Farmers who have used this mould as manure recommend it for wheat, mangolds, swedes, cabbages, potatoes, hops, roots, turnips, fruit trees, meadow land—in fact, for any crop. Tomatoes grown in it are larger in size, richer in colour, and sweeter in flavour. Bulbs grow luxuriantly in it. It is also good for flowering plants; a florist grows show chrysanthemums in it to his great satisfaction.

Mr. E. Price, of Hayes, Kent, wrote once to the Southwark engineer's department as follows: "I am very pleased to recommend your crushed refuse, having used it on pasture land for some years past, and have experienced both wet and dry seasons, and [illegible] on clay and gravel soil. I find it cannot be equalled, and am willing to show the land in this district that has been dressed with it to anyone making an appointment to see it."

The carriage and spreading of this manure over waste land would give work to a number of unemployed, and land that has been utterly useless would, at very small expense, be rendered by this system worth a good deal of money.

I shall be happy to give any officials or landowners any information they may wish to have on the subject. —Yours, &c.,

A. D. FURSE.
Manager,
The Patent Lightning Crusher Company, Ltd

SANITARY SERVICE.

To the Editor of THE SURVEYOR.

SIR,—The Royal Sanitary Institute has issued a letter to the members and associates calling attention to the circular issued by the Local Government Board to local sanitary authorities with regard to the maintenance of the sanitary service of the country during the war. In reply to this letter the institute has received offers from many of the members and associates to help in carrying on the sanitary administration; these offers are being sorted up and filed for reference purposes.

The council think that it may be of service to local authorities whose staffs have been depleted owing to the war to know that information is available at the institute as to qualified men and women who are able to take up temporary work in sanitary administration, and also as to those who would be willing to give some voluntary assistance in public health work.

The institute will be pleased to afford any information or assistance possible in the matter to authorities who may wish for it, if they will write to the secretary, at 90 Buckingham Palace-road, London, S.W.—Yours, &c.,

E. WHITE WALLIS,
Secretary, Royal Sanitary Institute.

90 Buckingham Palace-road, S.W.
September 21, 1914.

Prevention of Down Draught.—A new booklet dealing with the "Perfect" down-draught preventing chimney pot has been issued by the manufacturers, Messrs. J. H. Sankey & Sons, Limited, Essex Wharf, Canning Town, E. By the use of the "Perfect" pot the wind is not allowed to enter the flue, being forced out of large louvre openings instead of down the chimney. In the summer time it acts as a ventilator.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Why is it that small packets sent by parcels post to the gallant men at the Front are charged 1s. by the Post Office, whereas similar parcels sent, say, to a "waster" in the extreme North of England would only be charged 5d.? Cannot this unfortunate anomaly be altered by some arrangement with our French ally? Would not the Postmaster-General's popularity be somewhat greater than it is if he arranged for this concession to be made?

* * * *

Do most of us realise that this war may possibly continue for many years? Will not a little reflection show us that, when the Allies succeed in driving the Germans back into their own country, this will only mean the commencement of the struggle to crush their ascendency, and that to lay siege to their numberless, almost impregnable, fortresses will be a formidable task? Does not this point to the necessity for more and more recruiting, if we are ever again to enjoy the blessings of peace?

* * * *

"Lives there a man with soul so dead" that he is not moved to his inmost heart by the recent revelations of the unspeakable horrors committed by German soldiers on innocent men, women and children? Should not his soul be fired with a desire to revenge these outrages by bringing to account not only those who committed them, but those who inspired them?

* * * *

Is it not interesting to hear that 800 men of the Paris Fire Brigade have been sent to the scene of the recent fighting nearest to Paris in order to carry out certain sanitary measures with a view to removing any chances of an outbreak of enteric or other zymotic disease in the neighbourhood? Is not this a curiously modern development of the science of sanitation which is most instructive, and worthy of imitation in this and other lines?

* * * *

Can there be any truth in the statement that the French have in their possession a shell of so deadly a nature that when it bursts the fumes "produce complete paralysis of certain organs of the body, causing instantaneous and painless death to every living thing within its reach"? Is not this story a mere *réchauffé* of an incident in a play which was acted in London a few years ago?

* * * *

Are not the surveyors of this country to be congratulated on the manner in which their roads have withstood the abnormal strain which they have recently had to bear in the transport of large bodies of troops—both cavalry and infantry—as well as heavy field guns and wagons of all descriptions? Has there been a single complaint of damage caused by this "extraordinary traffic"?

* * * *

Was it not rather disappointing to find in last week's issue of the Royal Automobile Club Journal that an article headed "Concerning Shell" did not, as one expected, enlighten one on the new terrible explosive shell which the French are said to possess, but was merely a statement that the British Petroleum Company was a British and not a German concern?

* * * *

Was it not to be expected that the Road Board would notify all the highway authorities in England and Wales that as any traffic census taken at the present time would not show normal figures, it would be well to postpone this work of census-taking in connection with the proposed classification of roads?

* * * *

Was it not a very witty and correct summing-up of the individuals who take an interest in the weather when Dr. W. N. Shaw, F.R.S., of the Meteorological Office, in a speech at the annual dinner of the British Science Guild, quoted the following lines:—

> "Tinker, Tailor, Soldier, Sailor,
> Gentleman, Apothecary, Ploughboy, Thief,
> Airman, Fisherman, Sportsman, Postman,
> Railwayman, Newsman, Traveller, Crank,
> Colonist, Scientist Underwriter, Lawyer,
> Pioneer, Prisoner, Invalid, Tramp."

And above and beyond these "professions" could he not have added "engineer and surveyor," who are bound to take considerable interest in the weather?

The Surveyor
And Municipal and County Engineer.

PRO PATRIA.

[THIRD LIST.]

In our issue of August 28th we commenced the compilation of an "Honours" list of municipal, engineering and sanitary officials who are taking part in the great war. A most gratifying response was made to our request that readers should assist by notifying us of cases within their knowledge, the number of communications which have reached us being in fact so great that the publication of a second list became necessary last week. A third list is appended.

Baker, John, pupil of the engineer and surveyor to the Cannock Urban District Council, with the 5th Battalion Oxford and Berks Light Infantry.

Barnes, W., assistant surveyor to the Thornton Urban District Council, is a gunner in the RT Section, 11th Battery of the 2nd West Lancashire Royal Field Artillery. He is at present training at Coliton, Edinburgh, and has volunteered for foreign service.

Barron, W., electric supply department, Birmingham Corporation.

Bayliss, G. F., clerk, water department, Birmingham Corporation, Quartermaster-Sergeant, Southern Air Line Signal Company, Royal Engineers (Territorials).

Beesley, R. A., electric supply department, Birmingham Corporation.

Bennett, N., pupil in the engineer's department, Harrow, with the City of London Roughriders.

Bent, F. J., clerk, water department, Birmingham Corporation, 8th Royal Warwickshire Regiment (Territorials).

Bolton, Victor, pupil, surveyor's department, Bushey Urban District Council, with the 2nd Middlesex. For active service abroad.

Bowden, J. Scott, county veterinary surgeon, Cumberland, with the Cumberland and Westmorland Yeomanry.

Bowker, R. B., electric supply department, Birmingham Corporation.

Boyd, C. F., electric supply department, Birmingham Corporation.

Brearley, N. B., electric supply department, Birmingham Corporation.

Brown, D. H., electric supply department, Birmingham Corporation.

Bull, F. H., surveying assistant, Hornsey borough engineer's department, with the Artists' Rifles.

Carey, H. J., electric supply department, Birmingham Corporation.

Carter, J. W., electric supply department, Birmingham Corporation.

Charlton, R., clerk, water department, Birmingham Corporation, sergeant, 4th King's Shropshire Light Infantry (Territorials).

Clayton, F. T., engineering assistant, water department, Birmingham Corporation, Captain, 5th Royal Warwickshire Regiment (Territorials).

Cox, A., electric supply department, Birmingham corporation.

Cox, H. J., electric supply department, Birmingham Corporation.

Cripps, C. G., clerk, water department, Birmingham Corporation, Royal Field Artillery, 3rd South Midland Brigade (Territorials).

Cullis, E. H., electric supply department, Birmingham Corporation.

Cutts, A. H., clerk, water department, Birmingham Corporation, Royal Army Medical Corps.

Dickinson, Arthur J., surveyor to the Redditch Urban District Council, Major commanding Southern Airline Signal Company, Royal Engineers (Territorials). Has volunteered for foreign service.

Doherty, F. W., clerk, water department, Birmingham Corporation, Royal Warwickshire Regiment (City of Birmingham Battalion).

Edwards, E. A., clerk, water department, Birmingham Corporation, 6th Royal Warwickshire Regiment (Territorials).

Ellison, G., assistant sanitary inspector of Hornsey, with the Royal Army Medical Corps.

Firman, W. H., surveyor's department, Teddington Urban District Council, Territorials, 8th (Reserve) Battalion Middlesex Regiment.

Fleming, H., clerk, water department, Birmingham Corporation, Royal Warwickshire Regiment (City of Birmingham Battalion).

Float, S. E., electric supply department, Birmingham Corporation.

Gibson, D. A., small holdings land agent for Cumberland, with B Company, 4th Border Regiment (Territorials).

Glaze, B. C., electric supply department, Birmingham Corporation.

Godfrey, W. H., clerk, water department, Birmingham Corporation, lance-sergeant, 4th King's Shropshire Light Infantry (Territorials).

Goodall, F., electric supply department, Birmingham Corporation.

Grace, S., clerk, Hornsey medical officer's department, with the 7th (County of London) Rifles.

Green, G. F., clerk, water department, Birmingham Corporation, Royal Warwickshire Regiment (City of Birmingham Battalion).

Grew, H. W., clerk, water department, Birmingham Corporation, Royal Warwickshire Regiment (City of Birmingham Battalion).

Guest, A. T., clerk, water department, Birmingham Corporation, Royal Army Medical Corps.

Gunson, A., treasurers' department, Kendal, with B Company, 4th Border Regiment (Territorials).

Haugh, J. P., chief assistant, surveyor's department, Pontypridd, with the Glam. R.E.

Hayes, F. G., surveyor's department, Kingswood Urban District Council.

Hayes, F. W., electric supply department, Birmingham Corporation.

Hemming, W. H., electric supply department, Birmingham Corporation.

Hill, P. H., electric supply department, Birmingham Corporation.

Hinnell, Harold G., assistant surveyor, Ulverston Urban District Council. Lieutenant 7th Battalion Cheshire Regiment (Territorials). Volunteered for foreign service.

Johnston, Dr. J. M., assistant medical officer of health for Hornsey, with the Royal Army Medical Corps.

Kernick, R. S., electric supply department, Birmingham Corporation.

Kindell, F. P., ASSOC.M.INST.C.E., surveyor's department, Beckenham Urban District Council, 2nd Lieut., 8th London (How.) Brigade R.F.A.

Leece, T. M., electric supply department, Birmingham Corporation.

Lees, H., clerk, water department, Birmingham Corporation, 8th Royal Warwickshire Regiment (Territorials).

Lerew, A. J., clerk to the engineer and surveyor to the Cannock Urban District Council, with the 5th Battalion Oxford and Berks Light Infantry.

[illegible] assistant in the Leeds highways department, has joined the London Rifles (Artists' Battalion).

[illegible] Birmingham Corporation, private, 4th King's Shropshire Light Infantry (Territorials).

[illegible] engineer's department, Bromley Urban District Council.

[illegible] J. W. P. [illegible] county surveyor's department, has joined the 6th Battalion Buffs Regiment.

[illegible] H. W. [illegible] Birmingham Corporation.

[illegible] H. [illegible] Birmingham Corporation.

[illegible] E. [illegible] engineering department, West Hartlepool, joining Durham Royal Garrison Artillery (Territorials).

[illegible] D. E. [illegible] Hackney Corporation, has joined the 6th Battalion Duke of Wellington's West Riding Regiment.

[illegible] Hurst, assistant surveyor, engineering department, Bromley Urban District Council, with the 2nd London Sanitary Corps. For active service abroad.

Owen, W. A. E., clerk, water department, Birmingham Corporation, 8th Royal Warwickshire Regiment (Territorials).

Pinnell, G., clerk, Hornsey borough engineer's department, with the Queen's Westminsters.

Pratt, O. S., second assistant, engineer's department, Harrow, with the Public Schools Battalion attached to Middlesex.

Price, J. W. G., temporary assistant to the county surveyor of Kesteven (Lincs), with the Army Service Corps.

Rogers, M. S., engineering and architectural assistant, Cornwall county surveyor's department, with the Denbighshire Hussar Yeomanry.

Rowcroft, G. A., engineering assistant, water department, Birmingham Corporation, Royal Warwickshire Regiment (City of Birmingham Battalion).

Ruscoe, G. W. O., electric supply department, Birmingham Corporation.

Saunmons, G. H., electric supply department, Birmingham Corporation.

Shaw, S. [illegible] engineering department, Birmingham Corporation.

Sherren, O. A., surveyor to the Cheriton Urban District Council.

Sinnott, E. S., Lieut.-Col., V.D., county surveyor of Gloucestershire, with the West Midland Territorial Force, at Bath.

Smith, E. C., clerk, water department, Birmingham Corporation, 5th South Staffs Regiment (Territorials).

Smith, L., junior assistant to the county surveyor of Kesteven (Lincs), with the Lincolnshire Yeomanry.

Smith, W. J., clerk, water department, Birmingham Corporation, 8th Royal Warwickshire Regiment (Territorials).

Stanley, F., clerk, water department, Birmingham Corporation, driver, Southern Air Line Signal Company, Royal Engineers (Territorials).

Tamblyn, George, clerk, Cornwall County surveyor's department, with the 5th (Service) Battalion, Duke of Cornwall's Light Infantry.

Todd, I. H., clerk in the Leeds highways department, is serving as a sergeant in the Prince of Wales' Own West Yorkshire Regiment.

Tucker, Halcombe C., Leicestershire County Council staff, has joined the 8th Reserve Cavalry Regiment.

Tuffin, A. E., surveyor's department, Teddington Urban District Council, 8th (Reserve) Battalion Middlesex Regiment.

Turner, E., draughtsman, Hornsey borough engineer's department, with the Royal Army Medical Corps.

Tyler, J. L., clerk, water department, Birmingham Corporation, 8th Royal Warwickshire Regiment (Territorials).

Webster, P. J., electric supply department, Birmingham Corporation.

Webster, T., draughtsman, borough engineer's department, West Hartlepool, with the Army Medical Corps.

Wheeler, P. H., clerk, water department, Birmingham Corporation, Royal Army Medical Corps.

Wilde, F. J., clerk, water department, Birmingham Corporation, Captain, North Midland Division Transport and Supply Column, Army Service Corps (Territorials).

Wilde, H. R., clerk, water department, Birmingham Corporation, Quartermaster-Sergeant, North Midland Division Transport and Supply Column, Army Service Corps (Territorials).

Williams, Ifor, third assistant, surveyor's department, Pwllheli, with the 4th Denbighs.

Wilson, F., draughtsman, borough engineer's department, West Hartlepool, with the Royal Field Artillery.

Wilson, Percy, divisional county main road surveyor, Cumberland, with B Company, 4th Border Regiment (Territorials).

Wood, D. S. [illegible] engineering department, Birmingham Corporation.

Wood, Maurice, assistant to surveyor, Seaford Urban District Council, 2nd Lieutenant, Sussex Fortress Engineers. Has volunteered for foreign service.

A director of the Penmaenmawr and Welsh Granite Company, Limited, Lieut. H. D. Darbishire, of the West Lancashire Howitzer Brigade, and two managing directors of the company, Major A. E. Johnson, of the 4th Battalion, and Captain A. H. Wheeler, of the 6th Battalion, Royal Welsh Fusiliers, together with 100 of the men are away on active service.

THE WAR.

ENLISTMENT BY PROFESSIONAL MEN.

A corps of Royal Engineers, composed mainly of members of the engineering profession, is being enlisted at No. 2 Savoy-hill, W.C. Surveyors and other professional men, with some experience of engineering and similar work, wishing to enlist in this corps should present themselves at the address mentioned. Those wishing to enlist in a professional body, but not having the engineering experience required for the above corps, should apply to the recruiting officer, 29 Hanover-square, W., where Sir Howard Frank has kindly provided offices for this purpose.

LOCAL AUTHORITIES AND THE WAR.

Ten members from the indoor staff of the Beckenham Urban District Council have, together with thirty-three of the outdoor employees, joined either the Army or Navy Force. By resolution of the council, the married men receive full wages, and the single men two-thirds of their wages, less the amount received as active service pay.

We are asked to state that Akonia, Limited, 120-121 Bank Chambers, 329 High Holborn, E.C., is British, and that 96 per cent of its capital is held by British subjects, while the directors, including the managing director, and all the members of the staff, are British born; furthermore, Akonia is entirely produced in England.

The Royal Institute of Public Health is authorised by the War Office to enrol recruits for the Royal Army Medical Corps, who should be between the ages of eighteen and thirty-five. Men possessing special experience, such as is evidenced by sanitary inspectors, chemists (Pharmaceutical), or advanced first-aid certificates, are especially invited to offer themselves for enlistment for three years or for the war only. Applications, stating age, qualifications, &c., to be addressed to the Secretary, 37, Russell-square, W.C.

Messrs. Herbert Morris, Limited, Loughborough, inform us that over 160 of the staff and men from Empress Works are now serving with the Colours. The organisation of the works has proved amply capable of dealing with this state of affairs, in spite of the fact that orders received during August were well up to the average of the previous twelve months, and in excess of the monthly average of the preceding three years, and no customer has been disappointed in his deliveries. The firm have every confidence in the situation, and although they have very large stocks, they have, during the last month, placed contracts for materials to see them over the next six to nine months. Out of 1,070 accounts due at, or previous to, August 4th, in only six cases of inconsiderable importance has the moratorium been taken advantage of. It is the company's intention, as far as possible, to absorb all hands taken on in place of those who have joined the Colours, who will be reinstated on their return, and plans are being prepared for works extensions, the first contract for which it is hoped to place in about a fortnight.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

Mr. J. A. ELCOMAN, of Faversham, to whom the premium for August was awarded, has selected "Road Construction and Maintenance," by Aitken (Griffin & Co.), and a copy of this book has been duly forwarded to him.

QUESTIONS.

This week answers are invited to the following questions:—

417. Sewer Construction.—A sewer is being constructed partly in tunnel. Describe a method of giving the levels in the heading, referring specially to the determination of the line of levels from the surface. (King.)

418. Iron Curved Roof.—Show details of an iron curved roof of 40-ft. span, resting on girders and stanchions on one side, and on a 14-in. brick wall on the other. The roof is to be covered with corrugated iron. Show enlarged details at the foot of the principal rafter at each end. (K. G. F., *Buckfastleigh*.)

423. Sewer Construction.—Show by sketches (plan and section) the junction of a 3-ft. and a 5-ft. brick barrel sewer.

424. Mechanics.—Distinguish between kinetic and potential energy, and show how they are measured in the case of a body falling from rest. Show that, if a body be let fall from rest, its energy remains constant till it reaches the ground.

425. Strength of Materials.—Explain why the resistance of a long strut depends more on the stiffness of the material than on its strength.

426. Geodesy.—Give a formula for computing the difference in height between two stations by means of the observed heights of the barometer, and state the meanings of the symbols used.

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

422. Building Construction. The earth in front of a semi-basement to a house has to be supported for a depth of 6 ft. Give a section of a suitable retaining wall, and prove its stability by a graphic diagram.

A wall of the section shown, 1 ft. 3 in. wide at top, 2 ft. wide at base, with a batter of 1½ in. to the foot on the basement side, will be found suitable. To prove this graphically, it will be necessary to find the horizontal earth pressure at the back of the wall, and also the weight of wall itself, per foot-run.

To find horizontal earth pressure.

By Rankine's formula—

$$P = \frac{1}{2} wH^2 \left(\frac{1 - \sin. \theta}{1 + \sin. \theta}\right)$$

where P = horizontal earth pressure per ft. run in lb.

w = weight of cub. ft. earth (112 lb.)

H = height of wall (6·0)

θ = angle of repose (say 45°)

It is assumed that the wall is not surcharged.

$$P = \frac{1}{2} \times 112 \times 6 \times 6 \left(\frac{1 - \cdot 7071}{1 + \cdot 7071}\right) \text{lb.}$$

$$= \frac{2016 \times \cdot 2929}{1 \cdot 7071}$$

$$= 345 \cdot 9 \text{ lb.}$$

∴ P = 3·09 cwt. (acting at one-third the height of wall).

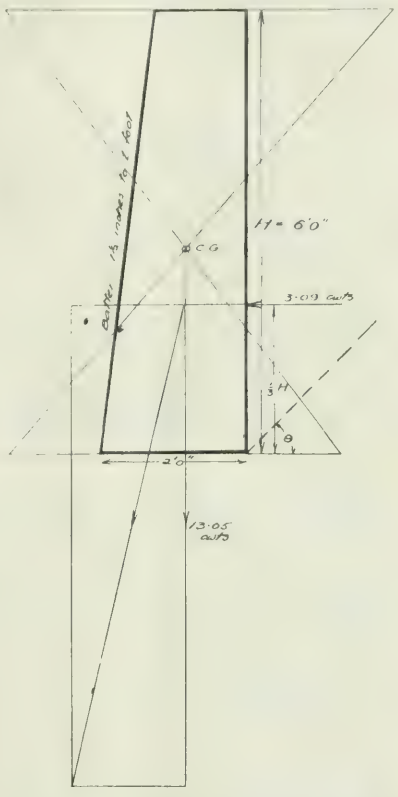
To find weight of wall.

Assume weight per cubic foot as 150 lb.

$$= 6 \times 1 \cdot 75 \times 1 \times \frac{150}{112} \text{ cwt.}$$

= 13·05 cwt. per ft. run of wall.

Then, by the parallelogram of forces the resultant thrust is found to pass through the base just 8 in. from the outer edge—*i.e.*, on the end of the middle



third. But as it is well known that Rankine's formula is 20 per cent to 30 per cent on the safe side, it is quite safe to assume that the wall is sufficiently strong. (C. I. G. S., *Hebden Bridge*.)

Manchester Municipal Employees and the War.—The officials and workpeople of the Manchester Corporation, numbering about 20,000, have resolved to impose a charge upon themselves in aid of the National Relief Fund to the extent of £500 a week. In the tramways department alone, within forty-eight hours, upward of 3,000 workers had authorised deductions to be made from their wages.

Storm-Water Drainage at Stretford.—The work of constructing a system of storm-water sewers in Stretford, Lancs, commenced in April last, is rapidly approaching completion. The scheme comprises about 1 mile of deep sewer formed of reinforced-concrete tubes, varying in diameter from 36 in. to 45 in., and the chambers for access, inspection and contingent work. The sewer is laid in headings from shaft to shaft in Chester-road, running parallel with and at a lower plane than the main sewer, which it is intended to supplement. The scheme was devised by the council's surveyor, Mr. E. Worrall, F.S.I., and approved, without alteration, by the engineering department of the Local Government Board, who subsequently sanctioned a loan to meet the cost of the work. Tenders were invited, and that of Messrs. Edmund Nuttall & Co., Trafford Park, was accepted.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Abersychan U.D.C. (September 10th. Mr. A. G. Dower.)—This was an application for permission to borrow money for the construction of new roads at Pontnewynydd and Twyngwyrdd, and for the improvement of the road and railway and river bridges at Cwmavon, including the execution of works in the Blaenavon Urban District. The application was made in order that works may be undertaken should the necessities arise to make provision for any unemployment occasioned by the war. It was stated that the County Main Roads and Bridges Committee had agreed to pay one-third of the net cost of the three schemes, which are stated to £9,150.

Bangor (Co. Down) U.D.C. (September 17th. Mr. P. C. Cowan).—£500 for providing bathing accommodation at Ballyholme, £550 for the purchase of water meters, £500 for providing bowling green, £2,700 for laying out Stricklands Glen as a park, £1,610 for the completion of Ward Park, £600 for widening Seacliff-road, £860 for the purchase of a steam tractor and two wagons, £1,550 for providing public conveniences at Clifton and Marine Gardens, and £1,480 for the purchase of a motor fire engine.—Evidence was given in reference to the various applications by, among others, Mr. H. C. Bell, surveyor.

Batley T.C. (September 9th. Mr. W. O. E. Meade-King).—£2,400 for the purpose of diverting and culverting the beck running through the lower portion of Wilton Park.—The town clerk, Mr. T. H. Craik, asked for as lengthy a period as the board could allow for the repayment of the proposed loan. It was intended to level up the site comprising the lower portion of the park in order that it might be laid out for recreation purposes. The borough surveyor, Mr. O. J. Kirby, gave estimates and details of the proposed works.

Belfast T.C. (September 15th. Mr. P. C. Cowan).—£6,000 for the extension of the Purdysburn fever hospital, £36,117 for erecting working-class lodging-houses, and £10,600 for extending the Purdysburn lunatic asylum.—Evidence was given by Mr. John Mackenzie (Young & Mackenzie) in regard to the infectious diseases hospital, and by Mr. N. Fitzsimmons (Watt, Tulloch & Fitzsimmons) in regard to the asylum buildings. With respect to the proposed loan of £36,117, the town clerk said the amount was made up as follows: The contract for the houses was £30,504, this being for 252 three-roomed houses. There were also some additional works, such as the erection of walls, completing of yards, and providing of spaces in front and rear of buildings. For this the city engineer, Mr. H. A. Cutler, estimated an expenditure of £3,538, and then, for contingencies and miscellaneous expenditure, there was an item of £2,073 15s. The city surveyor explained the proposed works in detail.

Chippenham T.C. (September 17th. Mr. A. W. Brightmore).—£1,500 for purposes of water supply.—The town clerk, Mr. J. W. L. Cooper, stated that the water supply of Chippenham was from an artesian well, and that for a long time there were great complaints as to the discoloration of the water, which was found to be largely attributable to iron. The council had decided to instal two filters and aërators, and it was to defray the cost of installation that the council wished to take up the loan. There was no opposition to the application.

APPLICATIONS FOR LOANS.

Beaconsfield U.D.C.—£9,600 for the provision of forty workmen's dwellings.

Brigg R.D.C.—£5,000 for workmen's dwellings.

Clitheroe T.C.—£2,800 for the Littlemore road improvement.

Dover T.C.—£30,000 for new cottages in the Pier district.

Glamorgan C.C.—£4,140 for erection of school buildings at Bryncethin; £6,565 for similar buildings at Clydach.

Southend T.C.—£5,985 for the making up and sewering of various roads.

Weobley (Hereford) R.D.C.—£1,200 for hospital purposes.

Worcestershire C.C.—£3,600 for new police buildings at Droitwich.

LOANS SANCTIONED.

Barnsley T.C.—£2,005 for new open-air school at Mount Vernon.

Brighton T.C.—£1,967 for alterations and additions to Middle-street council school.

Buckinghamshire C.C.—£1,795 for the enlargement of the Wolverton county secondary school.

Great Harwood T.C.—£2,100 for street improvement works in Heys lane and Water-street.

Llandilo R.D.C.—£1,500 towards the erection of Rhydymerdy bridge.

Luton T.C.—£6,000 towards the cost of erecting a new footbridge over the railway.

Mytholmroyd U.D.C.—£1,000 for the extension of water mains.

Preston T.C.—£2,400 for the purchase of two motor fire engines.

Ruislip-Northwood U.D.C.—£4,550 for the making up of Hillyard, Kewferry and Dene roads.

Southend T.C.—£16,000 for resurfacing and improving the main road from Hadleigh to Bournes Green.

Upton R.D.C.—£5,610 for water supply.

West Bridgford U.D.C.—£600 for the extension of the public offices.

Town Planning at Esher and the Dittons.—On Saturday last Mr. Thomas Adams held a Local Government Board inquiry as to the application of the Esher and the Dittons Urban District Council to prepare a town planning scheme, comprising an area of 1,645 acres. Mr. H. C. Fread, engineer and surveyor to the council (who had prepared the map of the scheme), was among those who gave evidence.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Kirkintilloch, York £6,851, housing and town planning—Acton £80,000, Mansfield £7,000, Sunderland; roads and materials—Bethnal Green, Durham £100,000, Lancashire, Oxford £43,000, Worcestershire £29,457; sewerage and sewage disposal—Barrow-on-Soar £15,000, Beverley £10,000, water, gas and electricity—Woolwich £10,000. Particulars of other works projected will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Blackpool T.C.—The provision of baths at the corner of Bloomfield-road and Central Drive is under consideration.

Derbyshire C.C.—The Education Committee on Tuesday accepted tenders of £9,060 and £3,654 respectively for the erection of new council schools at Borrowash and Bugsworth. In the case of Borrowash £2,187 is included for the provision of a cookery and manual instruction centre, but this portion of the scheme may not be proceeded with.—Tenders are to be obtained for the erection of a new school on a site between Chinley and Bugsworth.

Hastings T.C.—The rebuilding of the sea wall at the Marine Parade is to be carried out at a cost of £3,755.

Kirkintilloch T.C.—The burgh surveyor has prepared plans for public baths. One scheme, providing a swimming pond, 70 ft. by 35 ft., works out at £8,000, and an alternative scheme, giving a pond 60 ft. by 30 ft., would cost £5,250, exclusive of furnishing and professional fees. The council have asked for a report as to a cheaper scheme.

Margam U.D.C.—The widening of the bridge between Port Talbot and Tondu, at an estimated cost of £1,400, has been decided upon.

Nottingham T.C.—A suggestion to build a combined branch library and baths at Carrington is engaging the attention of the corporation.

Wolverhampton T.C.—The tender of Mr. W. Roe, at £3,165, has been accepted for the erection of firemen's dwellings.

York T.C.—Twenty-eight cottages are to be erected for the accommodation of tramway workmen. The cost is estimated at £6,851.

HOUSING AND TOWN PLANNING.

Acton U.D.C.—A report states that a scheme of workmen's dwellings, estimated to cost £80,000, is about to be put in hand.

Blaydon U.D.C.—A scheme for the erection of 400 working-class dwellings is in course of preparation.

Mansfield T.C.—The Health Committee have resolved to submit a proposal to the Local Government Board for the erection of forty houses in Baum's-lane, at an estimated cost of £7,000.

Middleton T.C.—It is proposed to build about twenty-four houses on the Boarshaw estate. The cost is estimated at about £5,000.

Portland U.D.C.—It is recommended that the council should apply to the Local Government Board for sanction to borrow £1,390 for workmen's dwellings.

Ruislip-Northwood U.D.C.—The Public Health Committee have been authorised to submit a scheme for the erection of twenty-two houses at Ruislip Common.

Sunderland R.D.C.—The council have applied to the Local Government Board for sanction to purchase 5½ acres of land at Burdon-lane, Ryhope, from the Ecclesiastical Commissioners, at a cost of £2,550, for working-class dwellings. About eighty houses are to be erected at an average cost of £222 each.

Swinton and Pendlebury U.D.C.—The erection of forty houses in Warwick-street, at an estimated cost of £7,900, is proposed.

Tilbury U.D.C.—As regards the scheme of housing in the North Ward, the Local Government Board state they will not be prepared to give their sanction to the loan until satisfactory arrangements can be made for the disposal of surface water and sewerage. With respect to the scheme of housing in the South Ward, the board suggests that 150 houses should be erected in the first place, divided as follows—viz., 88 houses, Class I.; 12 houses, Class II.; 50 houses, Class III. The board have arranged to sanction the purchase of 12 acres of land, in addition to the land at present vested in the council. The board further suggest that in any future part of the scheme the council should endeavour to provide some three-bedroomed houses of a less expensive type.

Uxbridge U.D.C.—It has been resolved to purchase 5 acres of land at Harefield for the purposes of a housing scheme.

PARKS AND OPEN SPACES.

Hoylake and West Kirby U.D.C.—The levelling of the upper grounds of West Kirby Park is to be carried out at a cost of £600.

Hyde T.C.—Approval has been given to proposals to spend over £3,000 upon schemes for providing a lake in the park for boating, the provision of hard tennis grounds, levelling land at Flowery Field, improvements near the Lodge-lane entrance to the park, making an additional entrance to the park, and park improvements.

Prestatyn U.D.C.—The Local Government Board have sanctioned a scheme for the purchase of a plot of land on the hillside—one of the chief attractions of the town for the purposes of a recreation and pleasure ground. The price of the purchase is £300.

Stanley (Durham) U.D.C.—A sum of £3,000 is to be expended on the purchase and laying out of Shield Row Wood as a public park.

REFUSE COLLECTION AND DISPOSAL.

Westbourne R.D.C.—A letter having been received from the Local Government Board stating that, unless the council proceeded with the scavenging in Bosham and Westbourne forthwith an inquiry would be instituted by one of the board's inspectors with a view to enable them to determine whether they should issue an order requiring the council to undertake the work, the council have decided to deal with the matter at once.

ROADS AND MATERIALS.

Annfield Plain U.D.C.—Tenders for the carrying out of private street works are to be obtained.

Barnsley T.C.—It has been agreed to make up Race-street by direct labour.

Bethnal Green B.C.—The borough surveyor, Mr. A. E. Darby, has interviewed the engineer to the Road Board, with the result that the latter provisionally promised that the Road Board would contribute the full amount overspent by the council on highways works approved by the board, if the total expenditure on highways for the year ending March 31, 1915, exceeds the amount of £14,741, provisionally estimated for normal works. A scheme has been submitted referring to special paving works which can be undertaken after the expedited normal works have been executed, provided the cost of such special works is borne by the Road Board. The scheme of special paving works relates to Brick-lane, Church-street, Globe-road, Green-street, Cyprus-street, Temple-street, Treadway-street, and Vyner-street, the total estimated being £9,583. The Emergency Committee have authorised the borough surveyor to submit this to the Road Board for approval, and it is understood that the sanction of the Road Board will probably be obtained at an early date.

Birstall U.D.C.—The tender of Messrs. J. Akeroyd & Son, at £758, has been accepted for making up North-terrace.

Bristol T.C.—The city engineer, Mr. L. S. McKenzie, reported recently to the Sanitary Committee that, as regarded two schemes of road widening—namely, Avonmouth-road and Filton-road—the engineer to the Road Board said that as these works involved a considerable amount of labour he considered them very suitable for the relief of distress should there be any. He suggested that the Avonmouth-road widening was

Cornwall C.C.—The purchase of certain road-making plant has been decided upon by the Highways Committee.

Daventry R.D.C.—The purchase of a road roller has been decided upon.

Dover T.C.—The Council have been recommended to carry out certain sewerage improvements.

Droitwich T.C.—The work of constructing in tar-macadam the [illegible] through the town has been entrusted to the Road Board.

Durham T.C.—Approval has been given by representatives of the Durham County Council, the West Hartlepool Town Council, and the Easington Rural District Council to a scheme for a new road through the colliery district of East Durham, and a deputation will be sent to the Road Board to make application for a grant. The cost of the work is estimated at from £80,000 to £100,000.

Easington R.D.C.—The clerk, Mr. J. Morley Longden, recently made a statement with regard to the proposed new coast road through the new colliery district of East Durham. He said representatives of the Durham County Council, the West Hartlepool Town Council, and the Easington Rural District Council had met and fully discussed the scheme, and approved it. The three authorities had decided to send a deputation to the Road Board and inform them that the application for a grant was a joint one from the Easington Council and the West Hartlepool Corporation, with the entire approval of the County Council. As between these authorities, the suggestion was that, after a contribution from the Road Board, each should bear 33⅓ per cent of the remaining cost, provided that the contribution from the Road Board was sufficiently substantial. It is estimated that the road will cost from £80,000 to £100,000.

Hastings T.C.—It has been decided by the town council to take up loans of £831 and £4,890 for repairing, kerbing, &c., in Battle-road, and for the wood paving of Robertson-street and part of Front Line.

Hayward's Heath U.D.C.—The council have approved the estimate of the surveyor, Mr. G. Plummer, at £1,295, for making up the remaining portion of Western-road under the Private Street Works Act.

Huntly T.C.—It has been agreed to treat part of Bogie-street with Rocmac upon a proper foundation.

Jarrow T.C.—It is proposed to carry out the Field-terrace improvement, at an estimated cost of £5,200, and to ask for a grant in aid of the work from the Road Board.

Kingston (Surrey) T.C.—Owing to their inability to supply Quenast granite in consequence of the war, the contractors have been allowed to substitute Welsh granite.

Lancashire C.C.—The County Main Roads and Bridges Committee have confirmed schemes for carrying out various road improvements. The Road Board have sanctioned the proposed works, and will give a grant of £45,000 towards them. The largest individual piece of work is the construction of an entirely new road between Blackpool and Poulton, at a cost of £26,000 towards which the Road Board will contribute £20,000.

Margam U.D.C.—The widening of the road from Bryn to Maesteg, at an estimated cost of £2,500, has been decided upon. The council are prepared to go on with a new road up the Avon Valley. Approval to this work—which is estimated to cost £14,180—has already been given by the Glamorgan County Council.

Oxford T.C.—Application has been made to the Road Board for a grant towards the reconstruction of the main thoroughfares of the city. The city engineer, Mr. W. H. White, estimates the cost of laying a solid foundation to the streets and resurfacing with tar-macadam at about £43,000.

Prestatyn U.D.C.—With the view of expediting the [illegible] at the time being providing employment at a time when it is much needed, the Local Government Board have informed the Prestatyn Urban District Council of their willingness to sanction a loan of £1,700 for road improvements in the district. A scheme has been adopted for widening and otherwise improving Meliden-road and Fforddlas, and further improvements are under consideration.

Preston T.C.—The borrowing of £6,075 for the improvement of Glover's Court is recommended.

Romford R.D.C.—A scheme for the widening of [illegible] at a cost of £1,332 was [illegible] agreed to forward it to the county council with a recommendation for its adoption.

St. Austell U.D.C.—Mr. E. D. Groves, the engineer and surveyor, has been instructed to carry out departmentally street improvements at East-hill (estimated cost, £50), High Cross-street (£60), Westcliff (£100), and Carvath (£50).

Shanklin U.D.C.—The surveyor, Mr. E. C. Cooper, has been asked to prepare plans and scheme for laying out and developing Miller's Green on the Esplanade.

Westhampnett R.D.C.—Application is to be made to the Road Board for a grant for surfacing the Upper Bognor-road with granite from the Chichester city boundary to a point about 300 yds. north of the Oak Inn, at North Bersted, in accordance with the estimate prepared by the surveyor of the lower district, amounting to £2,638. The surveyor of the lower district has been directed to prepare an estimate and specification for surfacing the direct Chichester to Selsey road with granite with the view to submitting an application to the Road Board for a grant for executing the proposed work.

Woolwich B.C.—Application is to be made to the London County Council for the balance of a loan of £10,295 for [illegible] the [illegible] powers of the borough.

Worcestershire C.C.—The Road Board have intimated their willingness to approve, provisionally, additional road improvement works at a cost of £29,457.

Yeovil T.C.—The making up of Rosebery-avenue has been decided upon.

SEWERAGE AND SEWAGE DISPOSAL.

Baldock U.D.C.—The Local Government Board have sanctioned the sewerage scheme as generally satisfactory, but suggest certain alterations, as to which it was agreed that the surveyor, Mr. P. Kent, should interview an engineering inspector at Whitehall.

Barrow-on-Soar R.D.C.—A proposal to carry out a scheme of sewerage and sewage disposal at Rothley was discussed at some length at Tuesday's meeting. Ultimately it was decided to apply to the Local Government Board for a loan of £15,000, the estimated cost of the work.

Beverley R.D.C.—Tenders are to be obtained for the carrying out of a drainage scheme estimated to cost £10,000.

Brighton T.C.—It is proposed to expend a sum of £2,000 on the provision of additional lavatory accommodation.

Camborne U.D.C.—Amended plans and specifications have been approved of a sewerage scheme, estimated to cost £22,429, and the tender of Mr. A. Carkeek, of Redruth, has been accepted for the work.

Clones U.D.C.—Works of drainage are to be carried out at a cost of £2,700, and Mr. Weaver, of Gloucester, the consulting engineer, has been instructed to invite tenders.

Royston U.D.C.—Tenders are to be obtained for alterations to the sewers in accordance with the report of Mr. Midgley Taylor, M.INST.C.E.

WATER, GAS, AND ELECTRICITY.

Belfast T.C.—The report of a sub-committee appointed to deal with the electricity undertaking came before the Tramways Committee on Monday. The sub-committee reported that they had considered and recommended the reports of Sir John Snell, M.INST.C.E., and Mr. W. J. Pratten, M.I.MUN.E., the consulting experts, in respect of the erection of a new

station on a site to be obtained from the Harbour Commissioners. The committee endorsed the reports and recommendation to the corporation. Sir John Snell emphatically advises the corporation on no account to remodel or extend the present station, but to proceed at once with a second power-house, more favourably and economically situated. He proposes the purchase of one 3,000-k.w. turbo-alternator, surface condenser and pumps without delay, together with one more 1,000-k.w. rotary converter, which, with a rotary now on order, would be the two first rotary converters sets to be fixed at the East Bridgestreet station. The total estimated cost of this work will be, approximately, £48,000. Mr. Pratten agrees with Sir John Snell that there is no other course but to build and equip a new station.

Glasgow T.C.—It has been agreed that application be made to Parliament for power to increase the city's sources of water supply, and that permission be given for the purpose of (1) re-submitting to Parliament the Loch Voil scheme, either alone or in conjunction with the river Turk scheme, or (2) submitting schemes for utilising the waters of the river Turk and the river Duchray without Loch Voil, as may be determined after the engineers have submitted their report.

Hastings T.C.—A sum of £2,444 is to be borrowed for the provision of new water mains; a loan of £5,000 for new electricity mains is also to be applied for.

Horsham R.D.C.—The services of a consulting engineer are to be obtained in connection with the provision of a wafer supply for Broadbridge Heath and Warnham.

Norman Cross R.D.C.—Tenders are to be obtained by the surveyor for boring in connection with a water supply scheme for Orton Waterville.

Northwich R.D.C.—Consideration is to be given by the council to a comprehensive scheme for a water supply for the Barnton and Winnington districts.

Okehampton R.D.C.—An improvement of the water supply of the parish of Chagford has been decided upon.

Thorne (Yorks) R.D.C.—The question of the water supply of Stainforth is receiving the consideration of the council.

Wolverhampton T.C.—The tender of the Davenport Engineering Company, at £2,620, has been accepted for the supply and erection of wafer cooling towers at the generating station.—It has also been agreed to accept the tender of Willans & Robinson, Limited, of Rugby, at £2,500, for the reconstruction of the 2,000-k.w. alternator at the electricity works.

Woolwich B.C.—An expenditure of £10,000 on new machinery in connection with the electricity undertaking is proposed.

MISCELLANEOUS.

Blaydon U.D.C.—A steam motor wagon is to be purchased at a cost of £200.

Carlisle T.C.—The city surveyor, Mr. H. C. Marks, has been instructed to inquire and report as to what sites in the city are available for cultivation as allotment gardens by men who may be wholly or partially unemployed in consequence of the war.

Cheltenham T.C.—The work of providing pumps and piping to give a supply of mineral wafer to the United Chemists' Association is to be put in hand forthwith.

Kingston (Surrey) T.C.—Four tenders have been received for providing and laying flooring for the swimming bath, removing it at the end of the season and replacing it at the opening of the succeeding season, and a committee recommend the acceptance of the lowest tender—that of Messrs. Limpus & Son, at £200.

Portland U.D.C.—Tenders are to be obtained for the supply of a tractor and wagon.

Stamford T.C.—Having been asked by the Kesteven county surveyor, Mr. W. B. Purser, to suggest any works that could be carried out in the Stamford district by unskilled labour, the council have suggested the cleaning out of the river Welland, a new road to be made from St. Paul's-street to Conduit-road, in accordance with a plan prepared by the borough surveyor, Mr. T. F. R. Ryman, the widening of Star-lane, as shown by the plan of the borough surveyor, and the making of a public convenience in the borough.

PERSONAL.

Mr. H. Stringfellow has been appointed highway surveyor to the Emsworth Rural District Council, at a salary of £80.

Mr. Thomas W. Morgan, assistant surveyor, Carmarthenshire, has been appointed divisional surveyor to the West Suffolk County Council.

Mr. J. W. Kirsopp, highways surveyor to the Carlisle Rural District Council, has been supplied by the council with a motor cycle at a cost of £62.

Mr. Oscar L. Cole, second assistant to the borough surveyor of Guildford, has been appointed an assistant in the office of the borough surveyor of Swansea.

Mr. P. C. Woodhall, engineer and surveyor to the Blandford Corporation, has been appointed surveyor and sanitary inspector to the Uttoxeter Urban District Council.

Mr. S. A. Hill-Willis, surveyor to the Tilbury Urban District Council, has been granted an increase of salary from £248 to £328 per annum, by four increments of £20.

Mr. H. M. Enderby, pupil to Mr. R. H. Jenkins, surveyor to the Skegness Urban District Council, has been appointed temporary assistant in the Aylesbury surveyor's office.

Mr. P. C. Smith, burgh engineer of Arbroath, has been appointed burgh engineer of Dunfermline, in succession to Mr. William R. Maxwell, whose resignation was reported in our issue of the 11th inst.

Mr. R. Curtis Cordon, surveyor to the Hereford Rural District Council, has been appointed surveyor to the Bucklow Rural District Council, at a commencing salary of £175 per annum, rising to £200, with allowances of £65 for travelling and provision of office. Mr. Cordon has held his position at Hereford for sixteen months. Previously, for two years, he was surveyor to the Buckingham Rural District Council, and assistant surveyor for 4½ years to the Belper (Derby) Rural District Council. His many friends will be pleased to hear of his success at Bucklow, Cheshire.

Mr. H. Percy Boulnois, M.INST.C.E., well known to all municipal engineers, has his two sons fighting for the country, one of them in command of a submarine in the North Sea, the other a Lieutenant of the Royal Engineers, who is at the front, and who was at the battle of Mons and is now under fire in the big battles that are raging in France. Both Mr. Boulnois' sons-in-law are barristers, but they have joined the Forces. One of them is a Captain in the 4th Berks Regiment, which has volunteered for foreign service, and the other has joined the Inns of Court Officers Training Corps. From what we know of Mr. Boulnois we feel sure that had he been a younger man he would have enlisted himself, and he would thus have had the satisfaction of feeling that all the male members of his family were doing their duty during this great crisis.

Mr. J. C. Midgley, a paper by whom on the problems of Newcastle-on-Tyne in connection with housing and town planning appeared in our last issue, is a native of that city, and has been in the service of the corporation for many years, having, after serving his pupilage as a surveyor, commenced service with the town council as a general engineering assistant. When the tramways were relaid in 1901-3 on the adoption of the overhead trolley system in place of horse cars, he acted as assistant resident engineer for the track. He afterwards acted as resident engineer for the track for several tramway extensions, and in a similar capacity for many important works of town improvement. In 1906 he was appointed central district surveyor, with administrative charge of roads, streets and sewers. Four years later he became deputy town surveyor. The work includes the supervision of the building inspection department, also the supervision and control—under the city engineer, Mr. W. J. Steele, M.INST.C.E., who is also town surveyor—of the erection of, and alterations to, all buildings, and the laying out of new building estates in the city, in addition to dealing with dangerous structures; all surveyor's work under the Factory and Workshops Act and the Public Health Acts, the preparation of town planning schemes in connection with, and all surveyor's work under, the Housing and Town Planning Act of 1909.

Permission has already been obtained from the Local Government Board for the purchase of certain [illegible] at the south end of the city for

Mr J. C. Middleby,
Deputy Town Surveyor, Newcastle-on-Tyne.

about 52½ acres, known as Craghall Dene area, and the other at the east end of the city for about 1,265 acres.

Warwickshire's Roads.—On Wednesday, at a meeting of Foleshill Rural District Council, there was a discussion regarding Bedworth main roads, and the members representing that town spoke highly of the work which the Warwickshire county surveyor (Mr. John Willmot) had put into them, during late months especially. One member said their condition was better now than it had been for fifty years past.

Manchester Town Planning Scheme.—On Wednesday Mr. George L. Pepler, Local Government Board inspector, held an inquiry at Manchester concerning the city council's application for authority to prepare a town planning scheme for an area on the southern side of Manchester. The scheme deals with unbuilt land, wholly within the city boundary, and includes Rusholme, Levenshulme, Gorton, Chorlton-cum-Hardy, Withington, and Didsbury. Mr. T. de Courcy Meade, M.Inst.C.E., the city surveyor, was among those who gave evidence in support of the application.

Wallsend's New Secondary School and Technical Institute.—The opening of a new secondary school and technical institute erected at Wallsend by the Northumberland County Council took place on Wednesday. The building is of attractive design in the English Renaissance style, and brick, with stone and terra-cotta facings, has been used throughout. On the ground floor there are eight large classrooms, assembly hall, gymnasium, and domestic science and mechanical departments, with a boiler-house adjoining. On the first floor there are chemical and physical laboratories with adjacent lecture rooms. The second floor is occupied by art and mechanical drawing rooms, with rooms for the staff and the offices. In a separate block there are dining-rooms for the students, manual instruction rooms, and caretaker's house.

Poole Water Scheme.—Poole Town Council held a special meeting last Friday to consider the preliminary steps for the development of their waterworks undertaking, involving, if carried out, an expenditure approaching £30,000. One feature was as to the employment of Mr. A. P. I. Cotterell, to supervise works (if so determined upon) he had recommended (apart from a £450 scheme for gas producer plant and junction main already carried out)—viz., additional pumping machinery and buildings, £8,700; additional service reservoir, with connections to rising and leading mains, £14,340; contingencies, £2,350; engineering, clerks of works, legal expenses, and cost of land, £3,000. After discussion, it was agreed that the question of the provision of a reservoir should be deferred, and that steps should be taken to provide such additional pumping capacity as may be necessary.

FOR OTHER ADVERTISEMENTS
See End of Paper.

FRIERN BARNET URBAN DISTRICT COUNCIL.

ENGINEER AND SURVEYOR'S ASSISTANT

A temporary vacancy occurs in the Engineer and Surveyor's Department owing to the War, and an Assistant is required with a good practical knowledge of Surveying, Levelling, Building Construction, Draughtsmanship, and Municipal Works.

Apply, giving full particulars and stating salary required, and when duties could be commenced.

(By order)

E. J. REYNOLDS,
Engineer and Surveyor.

Council Offices,
The Priory,
Friern Barnet-road, N.
September 23, 1914. (1,956)

WANTED, in a Borough Engineer's office in London, two Temporary Draughtsmen. Salary 35s. per week each.—Applications, stating age and experience, with copies of three recent testimonials, to be sent to Box 139, c/o Messrs. R. F. White & Son, General Advertising Agents, 33 Fleet-street, E.C. (1,959)

THE SHIPLEY URBAN DISTRICT COUNCIL invite offers for about 160 tons Old Steel Tram Rails, Fishplates, Tie Bars, &c., on their Bradford-road Tramway Track, recently relaid. Tenders, stating the price per ton for the material where at present laid, to be sent in not later than Tuesday, September 29th, 1914, endorsed "Old Tram Rails."

I. LINDOW,
Clerk to the Council.

Council Offices, Shipley, Yorks.
September 17, 1914. (1,957)

TO ASPHALTE CONTRACTORS.

The Battersea Borough Council invite Tenders for the Supply of Materials and Works for Resurfacing Roadways with Asphalt-macadam. Specification and Form of Tender may be obtained from the undersigned.

Tenders, endorsed "Asphalt," must be delivered by noon on Monday, 5th October, 1914.

W. MARCUS WILKINS,
Town Clerk.

Town Hall,
Battersea.
September, 1914. (1,961)

COUNTY BOROUGH OF SOUTHEND-ON-SEA.

TO IRON PIPE FOUNDERS.

The Corporation of Southend-on-Sea is prepared to receive Tenders for the Supply of approximately 200 tons of 8-in. diameter Cast-iron Spigot and Socket Pipes.

Particulars may be obtained on application to Mr. Ernest J. Elford, M.Inst.C.E., Borough Engineer, Municipal Buildings, Southend-on-Sea, on and after Thursday, the 24th inst., on payment of a deposit of Two Guineas, which will be refunded on receipt of a *bonâ-fide* Tender and the return of all documents.

Sealed Tenders, endorsed "Tender for Cast-iron Pipes," to be delivered at the office of the undersigned not later than 9 a.m. on Thursday, the 8th October, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender.

(By order)

H. J. WORWOOD,
Town Clerk.

Town Clerk's Office,
Southend-on-Sea,
September 23, 1914. (1,960)

JUNIOR ASSISTANT (20) desires appointment in Office of Surveyor, for wider experience. Just completed 3 years as Articled Pupil. Small salary for good opening.—Box 1,471, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (1,958)

The Cleethorpes New Sewerage Scheme and Outfall Works.

By JOHN S. ALLORD, M.INST.C.E.

[illegible] supplied [illegible] of the late Mr. Walter Ely, the surveyor, from whom, and from Mr. Pye, the deputy surveyor, he received much assistance from time to time in connection with the works.

The [illegible] of the port [illegible] Cleethorpes [illegible] the development of the steam-power industry, and the growing popularity of the town as a health resort.

The existing arrangements for the conveyance and disposal of the sewage and storm water required considerable [illegible], as a result of the increase in population.

The [illegible] system about to be superseded dates in its present form, from about 1894, when the southern outfall was extended. The main sewers are of an earlier date. The sewage and storm water is collected by two systems of sewers, one serving the northern part of the district, having an outfall on the foreshore near the northern urban district boundary, and the other serving the southern part, which discharges on the foreshore at the southern end of the district. Both of these outfalls have a continuous discharge when the level of the sea allows, and both deliver at unsuitable places. The northern outfall delivers about 200 yds. inside low-water mark, and the southern outfall at about 300 yds. inside low-water mark.

Although neither of these points of outfall is satisfactory for an uncontrolled discharge, the resulting inconvenience was negligible with the small population which previously existed. The increase of population, the larger area of paved surfaces, and the necessity of extending the sewerage system beyond the possible gravitation limits of the old sewers rendered a new main sewerage scheme imperative. In 1908 the council applied to the Local Government Board for sanction to a loan for new works, but the board rejected the scheme on the grounds that the sewers were not large enough, the capacities of the new pumping stations were insufficient, and the method of pumping unsatisfactory. The author's partner, the late Mr. George Chatterton, then became associated with the scheme, and the works now approaching completion have been designed and constructed under the direction of the author's firm.

The urban district of Cleethorpes may be divided, for present purposes, into three areas: (1) The northern portion, which is flat and at a level of about +11·0 [illegible] considerably built upon; (2) the central area, which is a hill of boulder clay rising to about +40·00 ordnance datum, and is considerably built upon; (3) the southern area, which is flat, parts being as low as +9·00 ordnance datum; this area is to a large extent undeveloped. The levels of the greater part of the district are such that a discharge into the sea by gravitation at a suitable point is out of the question.

The new point of outfall at low-water mark, at the southern end of the district, was indicated by general considerations to be one which would probably be suitable, and this has been confirmed by float observations. The question of the conveyance and pumping of the sewage in the most economical way was fully investigated, with the result that it was found preferable to have two pumping stations. These were required to be nearly 2 miles apart. About 300-horse power, including standby and auxiliary machinery, are required at each station, and it was considered undesirable to work the two stations from a central power-house, for reasons which will probably not be questioned.

The new main sewer commences at the northern end of the district and flows southward, along Grimsby-road, to a pumping station in Poplar-road, where, together with the sewage of the northern slope of the central hill, its contents will be pumped through a rising main 33 in. in diameter to the top of the hill. The lift is about 44 ft. From this point a new sewer has been constructed, extending to the southern end of the district, and which receives the sewage of the southern area along its course. At the southern boundary the sewage is lifted about 22 ft. (minimum) into a storage tank of 1,000,000 gallons capacity, and will be intermittently discharged into the sea at low-water mark.

The northern intercepting sewer varies from 15 in. diameter to 2 ft. 6 in. by 3 ft. 9 in. oval. It is constructed partly on piled foundations. The Poplar-road pumping station will contain two reciprocating pumps, being a duplicate provision for the dry-weather flow with a certain margin, and three centrifugal pumps, being two for the estimated volume and one standby for the storm water.

The southern intercepting sewer at its upper end is 2 ft. 4 in. by 3 ft. 6 in. oval, and 3 ft. 2 in. by 4 ft. 9 in. oval at the pumping station. Portions of this sewer also had to be constructed on piled foundations. The plant at the outfall pumping station is similar in character to that at the Poplar-road pumping station, but of greater capacity. The greater quantity to be pumped so nearly balances the less lift that engines of similar power will be installed in both cases.

The flat portions of the district have a subsoil of warp or estuarial silt of a variable depth, superimposed on boulder clay. The existence of this warp has made the new sewers expensive relatively to their length.

At the pumping stations the principle has been adopted of putting down pumps of long life, relatively expensive, for the dry-weather flow, and pumps of low first cost and relatively short life for intermittent storm pumping.

The storage tank is supported by 761 whole timber piles about 25 ft. long, which are driven down into the boulder clay. The test adopted was a sinking of $\frac{3}{8}$ in. with a 24-cwt. monkey falling 7 ft. 6 in. The piles will have to bear from 18 to 25 tons each when the tank is full of sewage.

The existing southern outfall terminated in a length of 18-in. pipes. These have been removed, and 30-in. pipes are being substituted, and the outfall extended to low-water mark. The northern outfall will be retained as a storm relief. It can never come into operation unless the pumps at Poplar-road are overpowered or break down. Under such circumstances the liquid escaping can only be what overflows from the upper end of a main sewer more than a mile long. There are no other storm overflows, as it was desired to prevent the discharge of sewage at any time and under any circumstances on a foreshore which is used and will be increasingly used by the public as a playground.

The future resident population on which the works have been based has been taken at 76,275. The absence of roundness in this figure results from a division of the district into areas, and the allocation of a definite future population density to each. The estimated future population may seem large, but it should be remembered that there are no less than eighty towns in England which trebled their population in the thirty years between 1871 and 1901.

The maximum storm flow is estimated to be at the rate of 400 gallons per head per diem for each resident, and has been arrived at by assuming $\frac{1}{4}$ in. of rain reaching the sewers per hour from 1,200 sq. ft. per house, and by adding the sewage proper and the ascertained leakage into the old sewers. The sewers have been designed for this flow from the future population given, but the capacity of the pumping plant to be installed now is for a population of 38,000. It can be increased when required. The outfall discharge pipe will have to be supplemented by further discharging capacity before the ultimate population is reached, but it is more than sufficient for the population for which the present pumping plant is provided.

It has been possible to arrange the inclinations of the sewers (other than small pipe sewers) in such a way that the velocity attained by a flow 50 per cent in excess of the average dry-weather flow from the present population shall in no case be less than 120 ft.

* Paper read at the Meeting of the Institution of Municipal and County Engineers at Cleethorpes on Saturday last.

[illegible] for the supply of which an agreement has been entered into [illegible] station, the price in both cases being for gas delivered at the stations. Other sources of power have been [illegible] steam from the destructor. In view of the complete [illegible] immunity from flooding, none of them offers any advantage [illegible] present there will be no destructor steam at night.

[illegible] work was rather more than half finished the contractor abandoned his contract, and the remainder of the [illegible] the scheme are being carried out by direct labour.

The sewage will be discharged during the whole of the ebb tide with the usual reservation as to heavy rain or emergencies. This period has been fixed to comply with the requirements of the Humber Conservancy, although the float experiments show, and the author believes, that the proper period is one commencing at two hours before high water and ter-

[illegible] summer months; as many as 50,000 people visit the town on the August Bank Holiday. The cleansing of [illegible] By these works Cleethorpes will have done all that is within her power. The Grimsby sewage outfall, which is near high-water mark, is a source of pollution to the shores of both Grimsby and Cleethorpes. This outfall is to be moved to allow of the construction of the new [illegible] It is hoped that the new position will be free from objection.

The original design of the storage tank was for a reinforced-concrete tank on reinforced-concrete piles. [illegible] was £40,000. The Local Government Board sanctioned the design, and gave ten years for the repayment of the loan. The author re-designed the tank, using mass concrete and timber piles. The estimated cost was £13,750, for which the board indicated their intention to give twenty-five years for repayment. The relative figures, [illegible] that:

	Estimated cost.	Period of loan. Years.	Annual charges.
Reinforced-concrete tank	£40,000	10	£1,255
Mass-concrete tank	13,750	25	880

The district council decided to adopt the mass concrete design.

The author considers this decision was sound, all things considered; he does not, however, wish to be understood as approving in all cases of methods of construction which justify a long repayment period. The establishment of a proper balance between the life of the works and the immediate requirements of the purchaser is probably the most difficult general, as apart from purely technical, problem with which the constructional engineer has to deal.

The overflow level of the storage is 21·25 ft. above ordnance datum, and the level of the lowest draw-off [illegible] ft. above datum. High water of ordinary Spring tides is +10·40. When the tank is used as a balancing tank—that is to say, with the outlet valve [illegible] and the pumps delivering storm sewage at their full present capacity—the discharge pipe will deliver the necessary quantity at high water of a Spring tide without the tank filling up.

The original scheme was prepared by the late Mr. Egbert Rushton, then surveyor to the council. The lines of outfall sewers laid down by him, as well as the approximate sites of the pumping stations, have not been materially departed from.

The works have, with the exception of a portion of the sewers executed by contract, been carried out under the supervision of Mr. James McKie, M.INST.C.E., first as resident engineer on the contract works, and later as officer in charge of the works done by direct labour. Mr. Guy and Mr. Hirst have acted as assistants to Mr. McKie in the construction.

Each pumping station will be provided with two stage air compressors, arranged to act as compressors for engine-starting purposes, and as vacuum pumps [illegible] The [illegible] tank [illegible] tion ground, provision has been made that all air exhausted from it shall pass through an air filter composed of a thickness of 12 ft. of clinker, in three successive layers of 4 ft. each, on which a stream of [illegible] of the air filter becoming frozen, a special water-[illegible] a small stream of warm water will run from the air filter delivery, which should prevent freezing. If, however, both the air filter and trap become frozen, the covers on the tank are of such a weight that they will blow off before any dangerous air pressure can [illegible] tank.

[illegible] with a gas jet.

The machinery is being supplied by the following firms: Gas engines, Crossley Brothers; reciprocating pumps, Tangyes, Limited; centrifugal pumps, Drys[illegible]

The original estimate of the cost of the work was £58,000. The final cost will be greater, by reason of the rise in prices since the original estimate was made, and because the greater part of the works have been carried out by direct labour. There is also an increase due to the altered design of the storage tank.

The first of these was unavoidable, and the increase due to the second will be justified by the better result [illegible] will not be large, and, seeing that the scheme, with small additions, is designed to provide for 75,000 residents, the ratio of cost to population is a very moderate one.

The author desires to make two observations arising out of the consideration of the design and execution of works of this character, which, however, have no special application to Cleethorpes.

(1) There is need of consideration [illegible] the practice of the committees of Parliament and the Local Government Board in respect to loan periods for constructional works. Parliamentary committees, in de[illegible] on the term for repayment, do not always take detailed evidence of the durability of the works to be constructed. The board make a detailed investigation. The results are often widely different in the two cases. For instance, in a recent case, a local authority having obtained by an Act a very long repayment period, [illegible] works by methods which, if under the purview of the Local Government Board, would have resulted in a ten years' period being fixed.

(2) In carrying out works by direct labour, the unsatisfactory nature of the restriction contained in sec. 174 (4) of the Public Health Act, 1875, is brought forcibly into prominence. Every important unit of plant or machinery has to be publicly advertised for, with the result that the engineer generally has to explain why the lowest tender should not be accepted. This has not created any difficulty at Cleethorpes, but it is not so everywhere. Where an open advertisement for plant or machinery is concerned, the author ventures to assert that in nine cases out of ten the lowest tender should not be accepted. In contracts for general construction probably that holds in half the cases that arise. The system of limited tendering seems to be technically barred by the Public Health Act, although it is in frequent use by many of the larger municipal authorities. An authority, properly advised, ought to be able, on its full technical right and without fear of the auditor—who is, to some extent, an enforcer of [illegible] ability to go to a committee of a special appliance and make a contract for supply. Further, it is often forgotten that an engineer cannot in all cases apply a test on delivery, or during the necessarily short maintenance period, which will enable him to say whether an appliance is durable. The tests are often impossible or relatively too expensive. If the Local Government Board had statutory power to dispense with sec. 174 (4), they could so exercise their discretion as to prevent the abuses at which the sub-section is presumably aimed. Most public authorities include a proportion of members who, under all circumstances, want to accept the lowest tender, and who are apt to regard any advice given to them to the contrary as being in some way interested. No doubt the process of driving a coach and four through an Act of Parliament has points in its favour as a practical expedient; but engineers, trained to apply the laws of nature to everyday affairs, are predisposed to methods of law and order.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr. J. S. PICKERING, M.INST.C.E., Borough Surveyor and Water Engineer, Cheltenham.

HINCKLEY MEETING.

A East Midland District meeting will be held at the Council Chamber, Hinckley, on Saturday, October 3rd.

PROGRAMME.

10.30 a.m.—The visiting members to meet at the Council Chamber, Hinckley, to discuss general business.

11 a.m.—The members and visitors will be received by the chairman (Mr. G. Kinton, J.P.) and members of the Hinckley Urban District Council.

11.30 a.m.—Discussions on the following papers: "Electric Power for Municipal Work at Hinckley," by Mr. E. H. Crump, A.S.E.E., A.M.I.C.E., chief engineer and surveyor to the Hinckley Urban District Council; and "Bridges and the Housing Question," by Mr. W. H. [illegible], Assoc.M.Inst.C.E., borough surveyor, Leicester.

12.15 p.m.—Inspection of public baths, adjoining the council offices.

1 p.m.—Luncheon at the Three Horse Shoes Hotel, as the guests of the chairman and members of the Hinckley Urban District Council.

2.15 p.m.—Proceed in motor conveyances (at a charge of 1s. per person) to inspect the workmen's dwellings erected and in course of erection by the Hinckley Urban District Council, and thence to the Snarestone Waterworks, 14 miles distant, to inspect the pumping station, &c., where tea will be provided by Mr. E. H. Crump.

4.15 p.m.—Leave Snarestone and drive to Gopsall Park, where members will be given the opportunity of inspecting the gardens, by kind permission of Earl Howe.

6 p.m.—Arrive at Hinckley Railway Station.

E. H. CRUMP, A.M.I.C.E., *Hon. District Secretary*, Hinckley.
E. G. MAWBEY, M.INST.C.E., *District Chairman*, Leicester.

J. W. DUDLEY ROBINSON, B.SC.(LOND.), *Secretary*.
92 Victoria-street, Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

Meetings will be held at Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

B. WYATT, *Secretary*.
39 Victoria-street, S.W.

ROYAL SANITARY INSTITUTE.

YORK MEETING.

On Saturday, October 28th, at a meeting of the Royal Sanitary Institute at York, Mr. F. W. Spurr, the city engineer, will open a discussion on "The Biological Treatment of the York Sewage."

In the afternoon visits will be made to the pumping station at Fulford, the sewage works at Naburn, and the new Earswick model village.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

ASSISTANT SURVEYOR.—September 26th.—Bridgwater Rural District Council. £85 per annum.—Mr. W. A. Collins, surveyor.

SURVEYOR AND INSPECTOR.—September 26th. Swaffham Rural District Council. £110 per annum. Mr. S. Matthews, clerk.

DIVISIONAL SURVEYOR. September 26th.—East Suffolk County Council. £135- £150 per annum.—Mr. W. Jervis, county road surveyor, County Hall, Ipswich.

GENERAL ASSISTANT September 26th. East Suffolk County Council. £90 £120 per annum.—Mr. W. Jervis, county road surveyor, County Hall, Ipswich.

ASSISTANT ROAD SURVEYOR.- September 26th. —Cupar District Committee, County of Fife. £100 per annum.—Mr. W. D. Patrick, district clerk, Cupar, Fife.

JUNIOR INSPECTOR.—September 28th.—Cheltenham Town Council. £65 per annum.—Mr. R. O. Seacome, clerk.

DESTRUCTOR AND SEWAGE WORKS MANAGER. —September 29th.—Corporation of Ealing. 50s. per week, with house.—Mr. W. R. Hicks, borough engineer and surveyor.

TEMPORARY ASSISTANT (Borough and Water Engineer's Department). September 29th. Tunbridge Wells Corporation. £3 per week.—Mr. W. C. Cripps, [illegible].

CLERK OF WORKS. - September 29th.—Portsladeby-Sea Urban District Council. £2 10s. to £3 per week.—Mr. Ernest H. Kempe, Council Offices.

TEMPORARY ASSISTANT. September 29th.—Corporation of Tunbridge Wells. £3 per week.—Mr. W. H. Maxwell, borough and water engineer.

GENERAL DRAUGHTSMAN (TEMPORARY). - September 30th.—Hampstead Borough Council. £3 3s. per week. Mr. O. E. Winter, borough engineer.

JUNIOR DRAUGHTSMAN (TEMPORARY).—September 30th.—Hampstead Borough Council. £1 10s. per week.—Mr. O. E. Winter, borough engineer.

CLERK (TEMPORARY).—September 30th.—Hampstead Borough Council. £2 2s. per week.—Mr. O. E. Winter, borough engineer.

SURVEYOR.—September 30th.—Blaenavon Urban District Council. £130 per annum.—Mr. I. G. Gwyn-Thomas, clerk.

CHIEF DRAUGHTSMAN.—September 30th.—City of Westminster. £200 - £250 per annum.—Mr. John Hunt, town clerk, City Hall, Charing Cross-road, W.C.

CLERK OF WORKS.—September 30th.—Axminster Rural District Council. £3 3s. per week.—Mr. C. Forward, clerk.

BOROUGH SURVEYOR'S ASSISTANT.—September 30th.—Smethwick Town Council. £120 per annum.—Mr. A. Hosken, borough surveyor.

ROAD FOREMAN AND BUILDING INSPECTOR. —October 1st.—Buxton Urban District Council. 37s. 6d.- £2 5s. per week.—Mr. F. Langley, engineer and surveyor.

TEMPORARY ENGINEERING AND SURVEYING ASSISTANT.—October 1st.—Corporation of South Shields. 35s. per week.—Mr. Leslie Roseveare, borough engineer.

—ROAD FOREMAN.—October 1st.—Hampton Urban District Council. £2 5s. per week.—Mr. Sidney H. Chambers, surveyor.

DISTRICT SURVEYOR.—October 2nd.—Monmouthshire County Council. £190—£230.—Mr. H. Stafford Gustard, clerk, Newport, Mon.

INSPECTOR OF NUISANCES. — October 3rd.—Corporation of Bolton. £85—£120.—Dr. John E. Gould, medical officer of health.

ARCHITECT.—October 5th.—Aberdare Education Committee.—Mr. T. Botting, director of education, Education Offices.

RESIDENT ENGINEER.—October 8th.—Fareham Rural District Council. 3½ guineas per week.—Mr. Alfred Laker, clerk, 97 West-street, Fareham, Hants.

ASSISTANT SURVEYOR (Temporary). — October 10th.—Harrow-on-the-Hill Urban District Council. £2 per week.—Mr. John Strachan, clerk.

TOWN FOREMAN. — October 10th. — Willenhall Urban District Council. 35s. per week.—Mr. T. Edgar Fellows, engineer and surveyor, Town Hall.

ASSISTANT ENGINEERS [illegible] Public Works Department [illegible] for the Colonies, Whitehall [illegible] S.W.

ASSISTANT ENGINEERS [illegible] the Crown Agents for the Colonies, Public Works Department [illegible] Victoria Street, London, S.W.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but these responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1028) subject to later confirmation by letter.*

ST. HELENS.—October 31st.—Drawings of police buildings and fire station, for the St. Helens Corporation. Premiums, £100, £50, and £25. Mr. A. W. Bradley, borough engineer.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. Buildings.

BEACHERIDGE.—September 25th.—October 23rd.—For the enlargement of the asylum, for the Court of Visitors.—Mr. H. Parker, architect, The Square, Bootle, Lancs.

STROUD.—September 26th.—October 5th.—For the erection of a tuberculosis block, for the Joint Hospital Board.—Mr. G. P. Mellon, architect, 7 Rowcroft, Stroud.

DYSART.—September 26th.—For the erection of a school, for the School Board.—Mr. W. Williamson, architect, Royal Bank Buildings.

KIRKCALDY.—September 26th.—For the erection of [illegible], for the Kirkcaldy and District School Board.—Mr. W. Williamson, Royal Bank Buildings, Kirkcaldy.

WORCESTER.—September 28th.—For the erection of a footbridge over Langdon's Brook, for the corporation.—Mr. Thomas Cairk, city engineer.

LINCOLN.—September 28th.—For the erection of a depot, for the urban district council.—Mr. J. Wilding, surveyor.

WHITEFIELD.—September 28th.—For alterations to public offices and the erection of fifty-eight houses, for the urban district council.—Mr. G. M. Denton, engineer and surveyor.

FAVERSHAM.—September 28th, 29th, 30th—October 14th.—For laying cast-iron pumping main, supply mains, with all necessary fittings, and the construction of a service reservoir, for the rural district council.—Mr. H. Howard Humphreys, 28 Victoria-street, Westminster.

NOTTINGHAM.—September 29th.—For the erection of four verandahs at isolation hospital, for the corporation.—Mr. A. Dale, city architect.

SOMERSET.—September 29th.—For rebuilding High Bridge, on the Taunton and Ilminster road, for the county council.—Mr. E. Stead, county surveyor, Wells.

CARDIFF.—September 29th.—For the erection of 144 workmen's dwellings, for the corporation.—Mr. W. Harpur, city engineer.

SOUTH MIMMS.—September 29th.—For the erection of twelve cottages, for the rural district council.—Mr. G. Simcox, surveyor, Bearwood, Potters Bar.

GLASGOW.—September 29th.—For the reinforced-concrete floor work at municipal buildings, for the corporation.—Messrs. Watson & Salmond, 242 West George-street, Glasgow.

MOLD.—September 30th.—For the erection of fire station and caretaker's house, for the urban district council.—Mr. R. S. Kelly, clerk.

STAFFS.—September 30th.—For the erection of a school, for the Education Committee.—Mr. C. Ballom, County Education Offices, Stafford.

ST. AUSTELL.—September 30th.—For the construction of a tunnel 500 yds. in length, with airshafts, and laying stoneware pipe sewer with manholes, for the rural district council.—Mr. W. H. Moffat, surveyor.

CHISWICK.—September 30th.—For the construction of a brick and concrete culvert, for the urban district council.—Mr. E. Willis, surveyor, Town Hall.

HEDON.—October 1st.—For laying water service piping, for the corporation.—Mr. H. Percival Binks, borough surveyor.

LONDON.—October 2nd.—For the construction of a service reservoir, for the Metropolitan Water Board.—Chief Engineer, Savoy-street, Strand, W.C.

STAFFORD.—October 3rd.—For the erection of an engineering school, for the Education Committee.—Mr. Cecil [illegible] Ballom, director of education, County Education Office, Stafford.

WEST RIDING.—October 3rd.—For the erection of a school, for the Education Committee.—Education Architect, County Hall, Wakefield.

ST. ANNES-ON-SEA.—October 3rd.—For extending [illegible] and pathways, for the urban district council.—Mr. T. Bradley, clerk.

SHEFFIELD.—October 3rd.—For the execution of works in connection with the covering of the river Sheaf, consisting of bridge widening, new weir, new bridge, retaining wall, and new street, for the corporation.—City Engineer.

DARTFORD.—October 3rd.—For the extension of the electricity works, for the urban district council.—The Surveyor.

BLACKBURN.—October 5th.—For the erection of a dispensary, for the corporation.—Mr. W. Stubbs, borough and water engineer.

EXETER.—October 5th.—For the erection of fourteen blocks of houses and flats, for the corporation.—City Surveyor.

HEYWOOD.—October 5th.—For extensions to electricity works, for the corporation.—Mr. J. B. Nuttall, borough surveyor.

DEVIZES.—October 5th.—For the erection of six workmen's dwellings, for the rural district council.—Mr. T. V. Trumper, Ivy House, Devizes.

SEVENOAKS.—October 6th.—For the erection of sixteen cottages, for the urban district council.—Mr. S. Towlson, surveyor.

STRATFORD-UPON-AVON.—October 7th.—For the erection of thirty-six workmen's cottages, for the corporation.—Mr. R. Dixon, borough surveyor.

SHEFFIELD.—October 7th.—For hospital extension, for the corporation.—City Architect, Town Hall.

COLWYN BAY.—October 8th.—For the erection of a refuse destructor, with steam boiler and auxiliary machinery complete, for the urban district council.—Mr. E. M. Lacey, consulting engineer, 42 Victoria-street, Westminster, S.W.

WARRINGTON.—October 9th.—For the erection of a school, for the Education Committee.—Mr. J. M. Murray, secretary, Education Office.

LANCASHIRE.—October 10th.—For the erection of a police station, for the Standing Joint Committee.—Mr. H. Littler, county architect, 16 Ribblesdale-place, Preston.

WEST SUSSEX.—October 13th.—For the erection of new schools and alterations to existing schools, for the Education Committee.—Mr. H. P. Roberts, county education architect, Thurloe House, High-street, Worthing.

LONDON.—October 20th.—For the extension of engine-house, boiler-house, coal store, and other works, for the county council.—Chief Engineer.

BOMBAY.—January 7th.—For the complete manufacture, erection and equipment of a refuse destructor for the incineration of 200 tons of refuse per day, for the municipality.—Mr. P. R. Cadell, municipal commissioner, Municipal Offices, Bombay, India.

WALLASEY.—(No date).—For electricity works extension, for the corporation.—Electrical Engineer, Sea View-road.

Iron and Steel.

BRADFORD.—October 7th.—For the duplication of seven pipe syphons, the supply of 7,500 tons of cast-iron pipes, and the supply of 900 tons of mild-steel pipes, for the corporation.—Mr. J. Watson, waterworks engineer, Town Hall.

GRAYS THURROCK.—October 5th.—For the supply of 680 cub. yds. of wire fencing, with wrought-iron standards, and four wrought-iron field gates, for the urban district council.—Mr. A. C. Lanes, surveyor.

Roads.

LEATHERHEAD.—September 27th.—For a supply of broken granite and steam rolling, for the urban district council.

HANWELL.—September 28th.—For the supply of broken Guernsey granite and distilled tar, for the urban district council.—Mr. Percy Scott, clerk.

RUNCORN.—September 28th.—For making up with tarred macadam certain streets and passages, for the rural district council.—Mr. R. Garnett, surveyor, Bold-street Chambers, Warrington.

WIGAN.—September 28th.—For paving work with granite setts, for the corporation.—Mr. A. T. Gooseman, borough engineer.

UXBRIDGE.—September 28th.—For steam rolling and scarifying, for the urban district council.—Mr. W. T. Harvey, clerk.

LLANDAFF.—September 29th.—For street improvement works, for the rural district council.—Mr. James Holden, surveyor, 20 Park-place, Cardiff.

COWES.—September 29th.—For the supply of broken granite and other road material, for the urban district council.—Mr. J. W. Webster, engineer and surveyor.

BARNET.—September 29th.—For the construction of new roads on the housing estate, approximately 1,800 sq. yds., together with about 1,000 ft. run of sewers, for the urban district council.—The Surveyor.

GATESHEAD.—September 29th.—For paving work, for the corporation.—Mr. N. P. Pattinson, borough engineer.

LITTLEHAMPTON.—September 30th.—For the supply of granite chips, pit gravel, and hoggin; also steam rolling, for the urban district council.—Mr. H. Howard, surveyor.

WOOD GREEN.—September 30th.—For the execution of private street works, for the urban district council.—The Surveyor.

CHISWICK.—September 30th.—For making up a street, for the urban district council.—Mr. E. Willis, surveyor.

KIRKCALDY.—October 2nd.—For laying a road with granite setts, for the corporation.—Burgh Surveyor.

TANGIER.—October 3rd.—For road construction, for the Moroccan Adjudications Commission.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

PRESTWICH.—October 4th.—For work of road improvement, for the urban district council.

SALFORD.—October 6th.—For paving, flagging and sewering works, for the corporation.—Borough Engineer.

BARCELONA.—October 9th.—For street paving works, for the municipality.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

Sanitary.

GRANGE-OVER-SANDS.—September 28th.—For the construction of 800 lin. yds. of sewers, for the urban district council.—Mr. T. Huddleston, surveyor.

UCKFIELD.—September 28th.—For the construction of sewers, for the urban district council.—Mr. W. H. Overton, 22 Ship-street, Brighton.

STRATFORD-UPON-AVON.—September 28th.—For the construction of drainage, manholes and flushing works, for the corporation.—Mr. R. Dixon, borough surveyor.

HAVANT.—September 28th.—For removing, washing, and replacing 2,000 cub. yds. of filtering material in the filter-beds, for the urban district council.—Mr. A. E. Stallard, surveyor.

DURHAM.—September 29th.—For the removal of refuse, [illegible] district council.—Mr. J. Mc[illegible], inspector, Avenue House, Shincliffe, Durham.

WESTHOUGHTON.—September 30th.—For sewerage works extension, for the rural district council.—Mr. G. Hayes, engineer and surveyor.

SALTASH.—October 1st.—For the removal of house refuse and road sweepings, for the corporation.—Borough Surveyor.

QUEENSTOWN.—October 2nd.—For the construction of an outfall sewer, for the urban district council.—The Clerk.

BANBURY.—October 3rd.—For the construction of about 1 mile of 18-in., 15-in., and 9-in. cast-iron and stoneware pipe sewers, with manholes, storm overflow chamber, erection of engine-house, refuse destructor-house, and other works, for the corporation.—Messrs. Willcox & Raikes, Union Chambers, 63 Temple-row, Birmingham.

WATH-UPON-DEARNE.—October 3rd.—For the alteration and reconstruction of the sewage disposal works, for the urban district council.—Mr. J. H. Drew, engineer.

MANCHESTER.—October 3rd.—For the supply of graded slag, stoneware pipes, best bends, stoneware covers, and stoneware underdrainage tiles, for the Rivers Committee.—Secretary, Town Hall.

BISHOP AUCKLAND.—October 5th.—For the supply of disinfectants, for the rural district council.—Dr. Penfold, medical officer of health, 9 Craddock-street, Bishop Auckland.

PRESTON (Lancs).—October 9th.—For taking up earthenware pipes and relaying in cast-iron and earthenware socket pipes, for the rural district council.—Messrs. Myres, Veevers & Myres, 15 Chapel-street, Preston.

ROMFORD.—October 17th.—For the construction of surface-water sewer and street works, for the rural district council.—Mr. W. J. Grant, surveyor.

LEEDS.—October 21st.—For the construction of three screening chambers, screening-house, three detritus pits, two mixing chambers, distribution chamber, [illegible] chamber, storm overflow culvert and outlet, 18 acres of bacteria beds, effluent channel and culverts and gauging chambers, and laying cast-iron feed mains, for the corporation.—Mr. Geo. A. Hart, sewerage engineer.

ALEXANDRIA.—December 8th.—For the construction of a sewerage system, for the municipality.—"M. le Président de la Commission Municipale d'Alexandrie," Alexandria.

Miscellaneous.

ASHTON-UNDER-LYNE.—September 28th.—For the supply of 9,200 yds. of artificially prepared blast-furnace slag, for the corporation.—Mr. J. Rowbottom, engineer, Town Hall.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

BENTLEY.—For the erection of 100 houses, for the urban district council.—Mr. E. G. Whatley, surveyor.

A. Storey, Hethorpe, Doncaster—72 houses	£11,334
E. G. Stubbs, Bentley, Doncaster—28 houses	6,666
E. G. Stubbs, Bentley, Doncaster—extra fencing	20

CHISWICK.—For a temporary talle range at the Chiswick Urban District Council's river depot, for the Chiswick Chamber of Commerce.—Mr. Edward Willis, hon. surveyor:

J. & J. F. Pallant	£164
L. L. Leeder & Co.	157
Nichols Brothers	141
H. Fowler	133
R. Blackburn	132

EVESHAM.—For the erection of workmen's houses, for the rural district councils of Evesham and Pebworth.—Mr. E. Holloway, surveyor.

	[illegible]	[illegible]	[illegible]
Lepley & Co., Evesham	£3,963	£3,442	£1,990

G. Sorrell, West Bromwich	3,500	4,000	2,010
H. W. Crisp, Evesham	3,450	4,015	1,990

HIGH WYCOMBE.—For refuse destructor and water-tube boiler, for the corporation.—Mr. F. J. Rushbrooke, borough engineer and surveyor:—

Meadows, Allott & Co.—back feed	£4,[illegible]
Hughes & Stanley—front feed	3,866
Heenan & Froude (back feed)	3,340
New Destructor Company—back feed	2,[illegible]
Meldrums, Limited—back feed	2,436
Meldrums, Limited (front feed)	2,361

[illegible] WYCOMBE. For [illegible] pipeage and watertube [illegible] the corporation. Mr. [illegible] Borough Surveyor [illegible] and Sanitary [illegible]

[illegible] & Hamblyn £4,987
Montgomery, Limited 4,500

[illegible] CHESTER. For [illegible] works in certain streets for the [illegible] Mr. [illegible]

Hilton Street Works.

[illegible] Smith & Son £4,851
[illegible] Manufacturing and Steam Supply Company, Limited 67
[illegible] & Co. [illegible] 644

Stevenson Road.

[illegible] Manufacturing and Steam Supply Company, Limited £1,000
London [illegible] 6
[illegible] & Co., Southampton 5
[illegible] & Co., Chester 5

[illegible] SHEFFIELD. For [illegible] of concrete for the [illegible] Council. Mr. W. [illegible]

J. W. [illegible] Accepted.

[illegible] STONE. For the [illegible] of the [illegible] Council. Mr. [illegible]

[illegible] & Co., London £[illegible]
[illegible] & Co., London [illegible]
[illegible] Middleton [illegible]

Surveyor's estimate, £[illegible]

[illegible] EAST. For the [illegible] and [illegible] and [illegible] chippings, for the Rural [illegible] Mr. G. W. [illegible]

[illegible] Limited, Peterborough, [illegible] 2½ in. [illegible] ton.
[illegible] and Stamp Slating Co., Limited, Leicester, [illegible] ton.
[illegible] Granite Brick and [illegible] Co., Limited, Leicester, [illegible] 2½ in., 2s. 9d. per ton.
Penlee and St. Ives Stone Quarries, Limited, Bristol.—2 in., 13s.; 2½ in., 11s. per ton.
Rowe & Mitchell, London.—2 in., 15s. 3d.; 2½ in., 14s. 11d. per ton.
Fry Brothers, Limited, Gravesend, [illegible] 2½ in., 14s. 10d. per ton.
Brooks, Limited, London, [illegible] 2½ in., 15s. 9d. per ton.
J. Mowlem & Co., London.—2 in., 15s. 11d.; 2½ in., 13s. 9d. per ton.
London Granite Company, Limited, London, 2 in., 16s. 3d.; 2½ in., 15s. 7d. per ton.

WELLINGBOROUGH. For the erection of a public convenience, for the urban district council. Mr. E. Y. Harrison, surveyor.

Hawkes Brothers, Wellingborough £[illegible]
W. Stevens, Wellingborough 365
E. Brown & Son, Limited, Wellingborough 350
Surveyor's estimate, £379.

WELLINGTON. For the construction of stoneware pipe sewer, for the urban district council. Mr. Geo. Riley, engineer and surveyor:—

G. P. Trentham, Birmingham £625
G. H. Ford & Co., Wellington 587
A. Pearce, Wellington 515
Engineer's estimate, £550

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

OCTOBER.

1. Institution of Municipal and County Engineers: East Midland District Meeting at Hinckley.
24.—Royal Sanitary Institute: Meeting at York. Discussion on "Biological Treatment of the York Sewage."

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency, only be telephoned (City No. 1046) subject to later confirmation by letter.*

BOROUGH OF ROYAL TUNBRIDGE WELLS.

BOROUGH AND WATER ENGINEER'S DEPARTMENT.

TEMPORARY ASSISTANT.

The Council are prepared to consider applications for the post of Temporary Assistant in the Borough and Water Engineer's Department. The person appointed must be a good draughtsman, and be thoroughly experienced in the use of the Dumpy Level, Theodolite, and other usual surveying instruments, in the setting out of Side Rails for sewerage works, taking of Levels, and Setting Out of Works; also the preparation of Estimates, and other work of a Borough Engineer's Office, and must have had good experience in a similar capacity under a public authority.

The appointment is rendered necessary by the enlistment of members of the Staff in His Majesty's Army or Navy consequent on the present European War, and, subject to the services of the person appointed proving entirely satisfactory, will be for a period of not less than six months, with a possibility of extension should the permanent staff not have returned to their duties at the end of that period.

Any further information, if desired, may be obtained on application to Mr. W. H. Maxwell, A.M.I.C.E., Borough and Water Engineer.

Salary will be at the rate of £3 (three pounds) per week paid monthly.

Applications to be in candidates own handwriting and to state age and experience, and earliest date duties can be commenced, to be accompanied by not more than three recent testimonials, to be sent to the undersigned not later than 10 a.m. on Tuesday, 29th September, 1914.

W. C. CRIPPS,
Town Clerk.

Town Hall,
Tunbridge Wells.
September 14, 1914. (1,954)

TENDERS WANTED.

CITY OF LEEDS.

LEEDS CORPORATION ACT, 1905 (SEWERAGE).

SEWAGE DISPOSAL SCHEME AT THORPE STAPLETON.

CONTRACT No. 50.

Consisting of the execution of the following sections of the work on the Sewage Works Lands at Thorpe Stapleton.

Part No. 1.—Three Screening Chambers, Screenhouse, three Detritus Pits, two Mixing Chambers, Distributing Chamber and all accessories.

Part No. 2.—Four Precipitation Tanks, Main Gauging Chamber, Storm Overflow, Storm Overflow Culvert and Outlet, &c.

Part No. 3.—Eighteen acres of Bacteria Beds, complete with Silt Mains, Effluent Channels and Culverts and Gauging Chambers, &c., including the laying of Cast-iron Feed Mains.

To PUBLIC WORKS CONTRACTORS.

The Sewerage Committee of the Leeds Corporation are prepared to receive Tenders for the above work.

The Contract Drawings may be inspected, and copies of the Specification, Bills of Quantities, Form of Tender, &c., can be obtained at the office of the Sewerage Engineer (Mr. Geo. A. Hart, M.INST.C.E.), 26 Great George-street, Leeds, on and after Monday, the 5th October, 1914, upon payment of a deposit of £10, which will be returned on receipt of a *bonâ-fide* Tender. Cheques must be crossed, and made payable to the City Treasurer, Leeds.

Tenders must be on the official forms supplied, enclosed and sealed in the endorsed envelope provided, and delivered at the Town Clerk's Office, Pearl Chambers, East-parade, Leeds, not later than 10 a.m. on Wednesday, the 21st October, 1914.

The Corporation shall not be bound to accept the lowest or any Tender.

(By order)
ROBERT E. FOX,
Town Clerk.

Town Clerk's Office,
Pearl Chambers,
East-parade, Leeds.
September 30, 1914. (1,935)

EX-PUPILS AND JUNIOR ASSISTANTS.

WANTED Appointment as Junior Assistant (22); articles recently expired (Municipal Engineer). Practical experience in surveying, levelling, waterworks, sewerage, sewage disposal and town planning. Passed Preliminary and Intermediate (Quantities) Examinations, Surveyors' Institution.—Box 1,470, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,952)

(Continued on p. xxvi.)

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. OCTOBER 2, 1914. No. 1,185.

Minutes of Proceedings.

London Water Supply.

The research work which is being carried out under the supervision of Dr. Houston is a continuation of that dealt with in preceding reports which have described the search for pathogenic microbes in river water and in crude sewage. In the tenth report the earlier results are summarised, and in addition an account is given of a further and more prolonged research for the typhoid bacillus in crude sewage. Dr. Houston states that "it is perfectly useless in work of this kind merely to register negative results," and shows how it can be proved that when a known number of pathogenic microbes are present, some, at least, can be isolated. His practice, therefore, is to divide each sample of water or sewage into two parts, and to inoculate one of them with a known number of pathogenic microbes. He then examines both under the same conditions. He finds that it is possible under these conditions to isolate the pathogenic germs, when present, in the proportion of one per 9 c.c. in the case of the typhoid bacillus, and of one per 19 c.c. in the case of Gärtner's bacillus. Thus it is argued, apparently, that if it is possible to find the germs that have been added to a sample of sewage or water, the failure to find germs in a similar sample to which they have not been added proves their absence. The argument is, however, not quite convincing, for it is clear that if any pathogenic germs were present in the water, the chances of finding some would be increased if more were added. If the germs were added to sterile water, and were then isolated, it would be a clearer proof that it is possible to find pathogenic germs where present in a certain proportion; if, however, they could not be isolated, there would be no proof that the sample of sewage or water did not contain the same number. The results of the examination of 101 samples of river water showed the absence of typhoid germs with the exception of one doubtful typhoid microbe and one doubtful Gärtner's bacillus. From this Dr. Houston concludes that the typhoid bacillus is not uniformly present in 9 c.c. of water, and that the Gärtner's bacillus is not uniformly present in 19 c.c. of water. It should be noted that this is a very cautious statement: taken by itself it means very little. Dr. Houston does not say that they are uniformly absent, which would be a very different thing. The report, unless it is very carefully read, is apt to convey such an impression, however, to the layman. With regard to crude sewage, we are told that 100 samples were examined, and that it was found that the typhoid bacillus could be isolated from an inoculated sample when present in the proportion of 1 per ·00066 c.c. of sewage.

It appears from the report that 1·17207 typhoid bacilli per cubic centimetre were added to the water samples, and that 10·6036 microbes were isolated from 500 c.c., which equals ·021207 microbes per cubic centimetre. Thus it appears that it is only possible to isolate a very small proportion of the germs which are known to be present. If, for instance, one typhoid bacillus per cubic centimetre had existed in the river water, apparently it could not have been detected. It seems that, as far as tests go, a certain number of germs may exist—too few for isolation—in the raw water, and that after adding others, the task of isolation being easier, a very small proportion can be isolated. With regard to sewage, it appears that 268 typhoid germs were added to ·01 c.c. of sewage, and that the number of typhoid bacilli actually isolated from ·01 c.c. was, on the average, seventeen. Can the method which will only isolate so small a proportion of the microbes known to exist in a given sample prove that typhoid germs are non-existent in a similar sample of the same sewage? We are, apparently, asked to believe that typhoid germs are absent from a sample of water because a method which can only detect two where 117 are known to exist has failed to find any, and also that typhoid germs are absent from a sample of sewage because a method which can only detect 17 where 268 are known to be present gives a negative result. Why, then, should it be assumed that the samples examined were quite free from typhoid germs before inoculation? Unless this assumption is justified, there appears to be no proof that germs can be isolated in the proportion of one per 9 c.c., or of one per 19 c.c., as stated in the report. Failing to follow the proof to this point, it is surprising to read that the results obtained become more reassuring "if it is permissible to hope" certain things which are set forth in order. Among these are such statements as "that it requires more than one typhoid bacillus to infect a susceptible individual with typhoid fever," or of "each draught of water being, so to speak, either a 'hit or miss' (an infection or a non-infection) unassisted by succeeding draughts of water." If these things have been proved it is unnecessary to hope that they are true, and their truth should be definitely stated; but unless they have been proved they are useless as argument, and it is therefore surprising to find them in a published scientific report, where they must at any rate create an impression and a belief in the mind of the public, concerning which the author is extremely careful to make no definite assertion.

Hydraulic Mains in Streets.

The decision of the Court of Appeal in *Charing Cross, West End and City Electricity Supply Company v. London Hydraulic Power Company* noted at page 56 *ante* is of considerable importance to companies and public bodies empowered to lay wires and pipes in streets, as well as to highway authorities. Put briefly, it amounts to this, that those who under statutory powers bring into a street for their own profit a dangerous

thing are bound, at their peril, apart altogether from any question of negligence, to prevent it from escaping, and it is no excuse that they are not responsible for the accumulation." The dangerous thing in the present instance was water at high pressure, contained in four hydraulic mains belonging to the defendant company. Owing to subsidence of the soil of the road the mains were fractured, and the escaping water damaged the plaintiff company's electric cables. There was some attempt on the part of the defendant company to contend that the Act of Parliament under which two of the mains were constructed exempted them from liability. This argument was based on the fact that a subsequent Act (under which the other two mains were laid) expressly stated that nothing therein contained should exempt the company from liability for nuisance, whereas the earlier Act contained no such provision. The Court was invited to infer that this omission was intentional, and that its effect was to protect the company from responsibility. But inasmuch as the latter Act provided that the two Acts should be "read and construed together as one Act" it is not surprising that this contention did not prevail.

The case is interesting as an illustration of the application, and perhaps as an extension, of the doctrine laid down in the leading case of *Fletcher v. Rylands* L.R., 3 H.L.C., 330. In that case there were underneath the defendant's land a number of disused mining shafts communicating with mines under adjoining land leased to the plaintiff. The defendant constructed a reservoir above these shafts. He was not personally guilty of any negligence, and employed competent persons to construct the reservoir, but it was not strong enough to bear the pressure of the water, which burst through the shafts and flooded the plaintiff's mine. It was held that the defendant was liable. Mr. Justice Blackburn, in his judgment, thus laid down the rule of law applicable in such cases: "The person who for his own purposes brings on his land and collects and keeps there anything likely to do mischief if it escapes, must keep it at his peril, and if he does not do so is, *primâ facie*, answerable for all the damage which is the natural consequence of its escape." It will be noted that in that case the dangerous thing was on the defendant's own land, and escaped on to the plaintiff's land, whereas in the hydraulic main case neither party had any right of property in the soil of the road. But the Court of Appeal (affirming Mr. Justice Scrutton) held that the doctrine applied nevertheless, and that the fact that the plaintiff company were not the owners of the soil, but merely had statutory powers to lay their cables in the road, was not material for the purpose of the application of the rule.

*

Traffic Statistics and Severity Factors.

The subject of severity factors for traffic on roads was one to which special attention was given in our last Special Annual Issue under the heading "Traffic Generally." In our issue of February 28th we published a letter in which Major W. W. Crosby made important practical suggestions with respect to the collection of information on this subject, and in the following issue—March 6th—we commented on the letter, and laid special stress on what seem to be certain essential elements of all comparisons of traffic effects. We pointed out in this article that there are two ways in which the problem may be attacked—we may compare tonnages modified by importance factors and related to costs, as measures, in different areas, of the combined efficiency of the roads and the vehicles, or we may assign severity factors to the vehicles and endurance factors to the different kinds of roads and compare efficiencies, measured in importance-tonnage in relation to the average severity-endurance factor, per mile.

In a useful paper, which will be found in another part of the present issue, Mr. J. Eastwood, Assoc.M.Inst.C.E., discusses the subject of traffic factors, with special reference to the writings of Mr. J. Walker Smith and Major W. W. Crosby, and to the researches of the Massachusetts Highway Commission. Mr. Eastwood fully bears out our contention that the tonnage factor is quite inadequate as a measure of traffic severity—a point on which Mr. Walker Smith lays great stress—and his study of the subject is well worth the attention of road engineers. There is, however, one element of prime importance the significance of which he does not seem to have fully grasped—this is, that we cannot assign a single severity factor to a particular kind of vehicle and a single endurance factor to a particular kind of crust, the reason being that these factors vary with the different vehicle-crust combinations. The average severity factor of a rubber-tyred delivery van, and the average endurance factors of granite setts and water-bound macadam, furnish us with no just estimate of the relative effects of the delivery van on granite setts and water-bound macadam respectively. Again, the rates of wear of a particular kind of crust will vary very much indeed according to whether the road is a dead flat, a gentle gradient, or a steep hill. Mr. Eastwood recognises the fact that the gradient has to be considered, but the effect of steepness is entirely different with different kinds of road stone, a gradient of 1 in 15 being no worse with some than 1 in 40 is with others, and so on. Mr. Eastwood's Table VI. gives a factor of 8 for motor cars, whether on a steep hill or on the level. This would hold good if the "level" stretches of road had really a small gradient, but not for dead flats. As regards iron-tyred motor vehicles, the element of road crust temperature is far more important than gradient for tarred roads. Similarly, one may find many other factors greatly affecting the results—gradient is only one and not the most important. Mr. Eastwood has, however, presented his view of the subject in a forceful and very practical manner, and his article is an important contribution to the study of traffic factors.

*

Municipal Engineers and the War.

The "roll of honour" which we have published for the past few weeks shows that municipal engineers of suitable age have not been slow in coming to the assistance of their country in the present crisis. There must be many, however, who, although precluded for one reason or another from answering the call for active service, are anxious to do what they can to help in the great business in hand. In this respect municipal engineers are more fortunately situated than those following almost any other profession, for the technical knowledge which they possess is of a kind which may easily be turned to good account by the military authorities. We are fully confident that there is in no quarter any lack of inclination to serve, but many engineers may be in some difficulty as to the particular channel into which their energies may be most usefully directed. Herein lies the value of an excellent article on "The Municipal Engineer and the King's Forces," from the pen of Mr. G. Bertram Hartfree, the surveyor to the Alton Urban District Council, which appeared in the last issue of the *Journal* of the Institution of Municipal and County Engineers. Mr. Hartfree's theme is that to be of use in a civil capacity to His Majesty's Forces at the present time the municipal engineer must be prepared to anticipate the requirements of troops, to co-operate with responsible Army officers, and to be ready with practical suggestions on relevant local engineering matters. The article to which we refer shows how these principles may be applied to the important matters of water supply, sanitation, camp cookery,

Red Cross hospitals, and bridges, and a careful perusal of it will go far to enable the municipal engineer to earn the gratitude of those whom he may be called upon to assist by thoughtfully anticipating their wishes.

It may be within the recollection of some of our readers that a movement was started a few years ago with the object of encouraging municipal engineers to acquire such knowledge as would fit them to render useful assistance to the military authorities in case of need. For reasons into which it is not now necessary to enter, however, no great success attended the efforts of the promoters, and the matter was ultimately allowed to lapse. The object of the movement having become so much more urgent with the outbreak of war, it is proposed to revive the idea, and to form a Municipal Engineers' Technical Reserve, using the remnant of the old body as a nucleus. The immediate object is the compilation of a list of persons willing to act as engineering officers in the Territorial Forces, to assist the Royal Engineers in civilian capacities, or to give their services in any way that would be of assistance to the military or naval authorities. Opportunities would also be afforded for the exchange of views on military matters, and for the instruction of junior members. Mr. Hartfree is acting as hon. secretary, and will be pleased to hear from those who may be willing to join. In the event of a sufficient number coming forward, an opportunity will be given of electing a new committee and executive officers.

* * *

Sanitary Services and the War.

It is more essential than ever, now that there are considerable concentrations of troops in various parts of the country, that the closest attention should be given to the details of sanitation, and it is therefore satisfactory to find that the Local Government Board has placed itself in communication with medical officers of health with a view to the adoption of precautionary measures for the protection of health and the prevention of disease. The circular which the Whitehall authorities have caused to be sent to the medical officers of health for Scotland lies before us, and as this is doubtless textually identical with that forwarded to such officers in every part of this country and Ireland, there need be no hesitation in stating that if the advice which it gives is strictly observed by those to whom it is addressed, not a little will have been accomplished in the maintenance of the sanitary services and the effective defence of public hygiene. Medical officers of health are invited to place themselves promptly in communication with the local military medical authorities, offering any services that may be useful, and this will readily suggest itself as a necessary and desirable step alike for the safeguarding of the local population as well as the men who are newly arrived upon the scene. The medical officer will, it is almost unnecessary to point out, have special facilities for giving valuable information and assistance to military sanitary officers on the following points: (1) In advising as to all local water supplies, and as to their protection from contamination; (2) in helping to secure satisfactory disposal of garbage and other refuse; (3) in securing satisfactory drainage or conservancy arrangements; (4) in the control of infectious disease, and in arranging for hospital provision for the ordinary infectious diseases, and for convalescent cases of enteric fever, and for the carrying out of disinfection. The sanitary and cleansing staffs will be able to supplement the efforts of the medical officers for the common good, and by this means we shall leave nothing to chance, either as regards preventive or protective measures rendered necessary to meet the present national crisis. It will be essential, of course, to give particular attention to the three outstanding diseases from which danger is most to be feared, viz., typhus fever, enteric fever, and smallpox—and with this end in view medical officers of health are advised to keep the medical officer in charge of local troops informed of any cases of infectious disease within the area, while, on the other hand, the military officer must also charge himself with the duty of notifying at the earliest moment cases for removal and isolation. A great deal of valuable work has already been done, so far with gratifying success, in meeting the none too stringent requirements of the Local Government Board—none too stringent considering what we have at stake—and we shall all hope that the sanitary organisations of the municipal and county authorities will be well able to meet the extraordinary call now made upon them in circumstances of national urgency and danger.

* * *

Loan Periods.

The obligation which is cast upon local authorities by the Public Health Acts and other statutes of obtaining the sanction of the Local Government Board before borrowing money for public purposes on the security of the rates implies that the central authority has some duty of a supervisory character to discharge in regard to local finance. We do not presume to suggest exactly how far that supervision should go, but we are at a loss to understand the meaning of the protest which was recently made by one of the board's inspectors at York, and reported in our issue of last week. The inquiry related to the purchase of some land for a depôt extension, and the inspector appears to have taken exception to an observation made by the town clerk to the effect that the loan was required for as long a period as the Local Government Board would allow. The fact that no specific period was asked for does not appear to us to contravene any important principle, for if any definite time had been mentioned, it would have been subject to the board's approval, which could neither have been given nor withheld unless the board were in a position to say what the proper term should be. The inspector made the further point that, as a general rule, small loans should be paid off within a comparatively short time—a principle that will be generally accepted. Ultimately it was agreed to ask for a period of twenty years.

* * *

Authority and Discipline.

The lot of the surveyor to the Cardigan Rural District Council does not seem to be an enviable one, judging from a report of the proceedings at the last meeting of that authority, which is before us as we write. It appears that the council had on a former occasion passed a resolution the effect of which was to withdraw the authority of the surveyor over the roadmen, a decision which it was now proposed to rescind. An amendment was moved, however, that the council retain authority over the roadmen, the reasons advanced being that it would not be to the advantage of the council as representatives of the ratepayers to give the surveyor full control, nor would it be advantageous to the roadmen to be in the hands of one man! This amendment was duly seconded and carried. It is hardly necessary for us to express our views on such a proceeding, or to comment upon its effect upon the discipline of the men, and its unfairness to the surveyor who has, presumably, to supervise without exercising authority or control. At the same meeting it was reported that the application of the surveyor for an increase of salary had been before the Finance Committee, who "made no recommendation." What the salary had been we do not know, but two proposals were put forward. The first was that it be *increased* to £60 a year for full-time work, and the alternative, which was carried, that it be £52 a year for five days a week. We do not wonder that the surveyor remarked that such remuneration was no encouragement to him in his work.

D

Traffic Factors.

By J. EASTWOOD, Assoc.M.Inst.C.E.

In order to consider the relative [illegible] forces of road construction and to compare the results obtained in one road with the results obtained in another, it is necessary to have some standard of comparison of traffic. There are many difficulties in the way of fixing upon a simple universal standard, and there is a danger of arriving at a false and misleading simplicity by ignoring many vital points. It will, however, be a real step forward if there can be agreed upon a standard which will hold good even within a limited area. Such a standard could be appointed out by the author in the correspondence on Mr. J. Walker Smith's paper,* of great value to the engineer in considering the question of improving the roads within the area, by affording an index to the tendency and hence the relative cost of various kinds of road construction under given conditions of traffic.

At one time it was considered sufficient in taking a traffic census to count the vehicles passing in a given time, but it has long been recognised that such a method of enumeration is useless for comparing a mixed mass of traffic passing along a given road with a mixed and possibly very dissimilar mass of traffic passing along another road. The late Mr. C. F. Deacon proposed to reduce traffic to a standard of tons per yard width of roadway per annum, and this is a system which has been largely followed, the Form of Summary of Statistics of Traffic issued by the Road Board being based on the method. While this was a great advance on the previous method, it does not take sufficient note of the character of the traffic and of the road surface.

A little consideration will lead to the conclusion that many other factors besides weight have an influence in determining the destructive effect of traffic on road surfaces. To take an instance which occurred within the author's experience: On a certain road which was paved with granite on concrete foundation, and had a gradient of 1 in 22 to 1 in 13, there was considerable motor wagon traffic to a neighbouring factory, a motor wagon with steel tyres passing backwards and forwards frequently, usually with a full load on the down journey. Under these conditions the life of the granite was from two to three years only, the setts being crushed to pieces. The steel tyres were then removed and rubber ones substituted, with the result that the life of the paving was more than doubled, though the traffic in tons per yard width per annum was practically the same throughout the period. Again, compare the destructive effect of a motor car with steel-studded tyres travelling at a fast speed on a macadamised road with that of a heavy motor wagon with rubber tyres passing slowly along a paved road. Mr. Walker Smith in the paper previously referred to says:—

"It will no doubt be readily granted that on macadam surfaces a 10-ton traction engine will do more damage than ten units of 1 ton each; and here again the extent of the relative damage will not be constant, as the extra damaging effect per ton of the heavier vehicles will decrease as the strength of the road increases, and, apart from questions of weight, all rubber-tyred vehicles—particularly fast-running motor vehicles—will have a more detrimental effect upon the surface of a water-bound road than upon the surface of a bituminous-bound road. It would therefore appear to be necessary, in order to standardise traffic effects, to lay down coefficients of potential damaging effect."

To this it may be added, as a necessary corollary, that the vehicles mentioned will also have a more detrimental effect upon macadamised roads generally than upon paved surfaces. In correspondence on the paper, Mr. Walker Smith again reiterated that he did not agree that coefficients of potential damaging effect should be based on the intensity of weight on the road.

It is the aim of this paper to discuss the conditions influencing the value of coefficients of potential damaging effect, or, as some American engineers call them, "traffic factors," a term which the author has adopted as being not quite so cumbrous as the other. The author has already enumerated some of these conditions in the correspondence on Mr. Walker Smith's paper, in which he also quoted factors suggested by Major Crosby, chief engineer, Maryland Geological and Economic Survey (The Surveyor, vol. xxxix. (1911), p. 364), and the New York State authorities. It will be seen, therefore, that the author is not advancing any novel suggestions, but rather elaborating previous ones, particularly the combining of leading features of both the method of traffic factors and that of the standard of traffic per unit width, by dividing the total traffic number by the width of the road in order to allow for difference in width, as suggested in the above correspondence.

It will be evident that the ideal table of traffic factors will contain factors for each class of traffic on every kind of road surface, and under all variations of conditions which are seen to affect the value of such factors. Such an ideal table is naturally unattainable, and if attainable would be too complicated to be of value. The tables of the American authorities, above cited, refer only to ordinary macadamised roads, while the tables in Mr. Walker Smith's paper refer to such roads, and also to macadamised roads with bituminous binding. In the present paper factors are proposed for certain classes of traffic for both macadamised and paved roads. These values are such as the author's present experience lead him to consider suitable, but owing to the lack of sufficient data they are only suggested as tentative figures to be modified in the future as experience may indicate to be necessary, as it is apparent that a table of traffic factors must be an empirical one, and must be continually checked and readjusted as fresh data are forthcoming.

The following considerations will all bear on the question of the wearing effect of traffic on road surfaces:—

Road.—Surface formation, foundation, gradient.

Class of Traffic.—Weight, intensity of weight, description of tyres, speed, method of shoeing in the case of horses.

Weather Conditions.

Width of Road.

The method of arriving at suitable traffic factors for various classes of road surfaces is as follows: Typical roads are selected where the effects of foundation and gradient may be neglected, and it is found that, comparing macadamised surfaces in one part of these roads with paved roads of different kinds in other parts of these roads, and subjected, as nearly as can be judged, to the same traffic, the lives, say, of granite macadamised roads, York stone paving and granite paving are in the ratio of 1 : 2½ : 6. If then factors for the different kinds of traffic passing over these roads can be agreed upon, say, for macadamised roads, it becomes an easy matter to deduce from these factors for other classes of road surfaces, provided a reliable traffic census is available. In the supposed case it will not answer the purpose merely to alter all the factors in the same proportions.

* "Proceedings" Institution Civil Engineers, vol. clxxxvi., page 292.

The results of the census must be taken and the various factors adjusted by trial until the total traffic numbers for the various classes of roads are correctly in the ratio of the cost of their surfaces. An examination of the census values given in table 6 will make this clearer.

The question of road surfaces generally has been referred to in the preliminary remarks. A few other points affecting these factors may now be briefly referred to.

FOUNDATIONS.

Closely allied to the question of surface formation is that of foundation, and the destructive effects of heavy traffic—especially heavy traffic [illegible] with studded tyres, on macadamised roads without proper foundation are well known. There is another aspect of this question which is perhaps not so well recognised, and that is the effect of a rigid foundation, such as concrete, in holding up the surface to the pounding action of fast-moving steel-tyred motors or similar heavy traffic. The road surface is then literally between the hammer and the anvil, and if the [illegible] impact overcomes the crushing resistance of the material the result is disastrous, as for example, in the case of the granite road referred to earlier, where the setts were crushed to powder in from two to three years. Similar cases occur with gritstone paving, even when not on concrete, provided the bed upon which it is laid is fairly solid.

The effect of a bad foundation cannot be allowed for in a standard table of traffic factors as the questions of degree and nature of defects then arise. The object in drawing attention to it here is to emphasise the fact that in gathering data for constructing such a table care must be taken that the observations are confined to roads where the foundations are such that the results will not be vitiated by them.

GRADIENT.

The damaging effect of horse traffic, in particular, is considerably increased by heavy gradients, the digging and pounding action of the horses' feet in drawing loads up the hill being very destructive of the road surface. On macadamised roads it loosens the surface and digs out the stones, while in wet weather the surface, being soft, is pounded to a pulp and the stones rounded in such a way that [illegible] is greatly facilitated. With paved surfaces the horses can only get a good foothold in the joints of the setts, and consequently wherever their shoes first strike the surface they slide downwards until they reach a joint, and the faces of the setts are soon so rounded that [illegible] only obtain a foothold with difficulty.

In a particular instance York stone paving on a gradient of 1 in 9 had in twelve months worn down 1¼ in. at the middle of the sett to 3 in. at the joint on the up side of a street in which on the down side the life of the paving was about four years. The up traffic was confined to one line, owing to metal plates having been placed for the wheels of vehicles to run upon, and consequently the whole of the above-mentioned wear was due to the horses' feet. The down traffic also tended to keep mostly in one line, as many of the vehicles had slippers on one wheel, and ground against the kerb with the other to act as a brake.

Generally speaking, in several cases where, owing to tramway lines in the centre of the road, or other causes, the traffic up and down roads having a gradient of 1 in 9 to 1 in 14 or so has tended to keep each to its own side, the life of paving on the up side has been from one-half to one-third of that on the down side, owing to this rounding of the setts.

In the accompanying tables an arbitrary division has been fixed upon at a gradient of about 1 in 14, and different factors are given for roads steeper and for roads flatter than this. It will be understood that there is no sharply defined difference between what happens on a gradient of 1 in 14 and on a gradient of 1 in 15. The effect due to gradient increases gradually as the gradient increases, and since the line must be drawn somewhere, it was thought fair to draw it at a gradient of 1 in 14, though that is entirely a matter of opinion, and it may be that this arbitrary division should vary with the nature of the road surface.

CLASS OF TRAFFIC.

The weight of vehicles, and more especially the intensity of weight, must have consideration in drawing up a table of traffic factors, as also must the speed at which the vehicle travels, as, other things being equal, a fast moving vehicle will do more damage than a slow moving one. Some authorities are of opinion that weight multiplied by speed would give a good basis for traffic factors for self-propelled vehicles, but this seems too severe upon light fast moving vehicles, though this, again, will depend somewhat on road surface, tyres, and so on. Since a vehicle is not always loaded up to its utmost capacity, nor always driven at its utmost speed, it is possible to attach too much importance to considerations of weight and speed. The influence of possible speed on the traffic factor will vary with the locality. On heavily trafficked urban or suburban roads a vehicle will not as often approach its speed limit as on a rural road, so that what seems to the town surveyor to be a suitable factor may appear unsuitable for a rural district.

It will scarcely be necessary to enlarge on the question of tyres, as it is plain that different tyres—rubber, rubber studded with steel, steel, and steel with transverse bars, as in traction engines—have widely varying effects on road surfaces.

In the case of horse traffic the damage to the road surface depends a good deal upon the method of shoeing. In many towns in the North having steep gradients, the horses, especially heavy horses, are shod in such a way as to give them a better foothold, and, incidentally, to damage the road surface much more than those which are flat shod. In summer they are shod with toe-bits at the front of the shoe and caulkers at the back. For a heavy carthorse the toe-bit is an oblong piece about $\frac{5}{8}$ in. square and 4 in. in length, fixed across the toe, and the caulkers are about 1½ in. square, and project about $\frac{3}{4}$ in. from the face of the shoe. In winter the horses are shod with plug shoes, having four holes into which steel plugs can be driven. These plugs project ½ in. to $\frac{3}{4}$ in., and newly sharpened plugs are inserted on the appearance of frost. Should the frost be of short duration, followed by a quick thaw, the effect of these plugs, both on macadamised and paved surfaces, is very severe.

WEATHER.

Where the atmosphere is generally humid, and there is a considerable proportion of wet days, the damaging effect will be greater on roads generally, and particularly on water-bound roads, than in the case of a drier atmosphere and with fewer wet days. It is not so much a question of comparing rainfall as the number of wet days and the general humidity.

WIDTH OF ROAD.

The author proposes to allow for variation in width by dividing the total traffic number by the width of the road. If, however, the road is so narrow that there is only room for two lines of traffic, the effect of the traffic is greater than would be indicated by the ratio total traffic divided by width, owing to the surface becoming rutted. Cases which have come under the author's notice include one in which where granite paving, owing to this cause, had a life of two to three years only as compared with ten years with the same traffic

ordinary conditions, and another in which gritstone paving had a life of four years as against eight years under ordinary conditions further along the same road. This, however, is one of the few references for which special allowance must be made, and which is outside the scope of a general table.

It will be seen that the question of traffic factors is a complicated one, and one which can only be simplified by careful observations, continued over a long period. Unfortunately, this research is costly and it would be difficult to persuade local authorities having charge of roads that it would be of sufficient value to repay the cost. It being essentially a matter of more than local importance, the accumulation of the necessary data might well be encouraged by the Road Board. In this connection it may be noted that in 1909 the Massachusetts Highway Commission (and Americans are not usually credited with a desire to spend money for nothing) expended over £900 in taking a traffic census, and the author is indebted to the secretary to the commission for a copy of the annual report of the commission for that year.

For the purpose of obtaining some figures for use in this paper a traffic census was taken on two roads, "A" and "B," on July 25 and 26, 1911, the details of which are given in Table I. The width of "A" road between the kerbs is 49 ft., and of "B" road 34 ft., the life of granite macadam being three and a half years and three years respectively.

From a consideration of these traffic observations and the life of macadam in these roads, and from other data, a table of traffic factors (Table II.) has been drawn up. This table also gives the factors of the New York State authorities and those

of Major Crosby. In each case the average traffic per day has been multiplied by its appropriate factor, and the "total traffic number" thus obtained has been divided by the width of the road. The result is what is here termed the "traffic intensity ratio" per foot of width. If the traffic intensity ratio for any road be multiplied by the life of the road surface the product would be the same for all roads if the traffic factors were suitable; hence this is a test of the suitability of the factors. In fact, if there were available sufficient data showing the average traffic throughout the year on a considerable number of roads, as

well as the life of the various classes of road surface on these roads, the traffic factors could be determined with absolute accuracy.

Table III. shows the total traffic number, the traffic intensity ratio, and the product of traffic intensity ratio × life of macadamised road for each of the above-mentioned tables of factors. It also shows similar results for Mr. Walker Smith's factors and the Road Board's factors, the last two being reduced to the same basis as the others by taking the led or ridden horse as unity. From this table it will be seen that the author's proposed factors and the New York factors give the most consistent results, but it is useless to dogmatise from these figures, as it is possible that a more extended traffic census might give very different results. There are available no other traffic figures with respect to "A" and "B" roads, but the following examples from the Massachusetts State Highway Census, previously referred to, show the variation of the traffic in August and October in a few cases in which the traffic averaged about the same as that on "A" road (Table IV.).

Taking the whole of the returns of that census, however, the variation was not so excessive (see Table V.).

From these figures it is apparent that a traffic census, in order to give reliable results, should cover a long period so as to show the seasonal fluctuations. On the other hand, the two roads "A" and "B" being main roads leading to a manufacturing town in the West Riding of York-

TABLE II. Table of Traffic Factors proposed by the Author for Macadamised Roads on the Level or Moderate Gradients. The table also shows the total traffic number and the traffic intensity ratio for various factors.

shire, most of the traffic is business traffic and it is probable that the fluctuation due to varying weather will be small as compared, for instance, with a road leading to a pleasure resort, and subject to heavy pleasure traffic during the summer; also, the two roads being subjected to similar traffic and both leading to the same town, any seasonal fluctuation will probably affect both roads, so that the relative figures, which alone affect the result, may not vary greatly throughout the year.

Accepting the author's factors in Table II. as a basis for macadamised roads on the level or moderate gradients, it is then possible to deduce from these factors for other gradients, and such other materials as are in use on the roads observed or similar roads. Unfortunately, the only figures available in addition to those for ordinary water-bound macadamised roads are for York stone paving and granite paving, and consequently the factors given are limited to these surfaces. Taking the life of these three surfaces to be in the ratio of 1 : 2½ : 6, as previously mentioned, experience seems to show that the life of each of them on steep gradients would average about two-thirds of their life on the level. Table VI. has been calculated on this basis, and is self-explanatory.

The utility of tables of traffic factors, if they can be based on sufficient data, so that they can be relied upon, is obvious. For instance, if a census of the traffic on any road be obtained, by the use of the appropriate factors, the relative life of the existing road surface and of any proposed substitute can be calculated, and hence the difference in annual cost of the existing road surface and the proposed substitute.

It is to be hoped that engineers in a position to do so will accumulate such data as may be useful for improving or verifying existing tables of traffic factors, and extending them to other classes of road surfaces. Mr. Walker Smith, in his paper previously cited, gives a very complete set of tables dealing with various classes of macadamised roads. They do not agree with the writer's results, as will be seen on referring to Table III., but this may be due to the writer's figures being based upon insufficient data.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—The rapid increase of sand wastes around our coasts is indeed a serious one, and Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

JUNIOR INSTITUTION OF ENGINEERS.

The council of the above institution have elected the Marquess of Graham as their president for the year 1914-15, in succession to Sir Robert W. Redwood.

The Vickers Prize, consisting of a gold medal and premium of instruments or books, has been awarded to Mr. James Richardson, B.Sc., Assoc.M.Inst.C.E., for his paper on "High-power Diesel Engines: Their Development for Marine Service." Mr. Richardson has also been fortunate enough in securing the Institution Medal for the same paper.

The other awards of this institution have not yet been announced.

It is interesting to note the excellent progress made with the local sections in Birmingham, Manchester and Sheffield. The membership has been considerably increased during the year, and the committees of each section are arranging a full and interesting programme for the coming session.

"Pax."—We have received a number of inquiries with regard to this new insect destroyer, of which some particulars appeared in our issue of the 18th inst. (p. 365). Having at present no information beyond that embraced in our note, we suggest that correspondents should communicate direct with the company concerned, whose address is 14 Caxton House, Westminster, S.W.

Belper Rural District Roads. In his report for the year ended March 31st last, Mr. Robert C. Cordon states that the expenditure in connection with the maintenance of the 162 miles of roads under his charge as engineer and surveyor to the Belper Rural District Council has been kept within normal limits, notwithstanding greatly increased traffic, motor and otherwise. This, he considers, is a matter for congratulation, having regard to the fact that the greater part of the district may be classed as semi-urban, being bounded on the south by the county borough of Derby, on the east by the borough of Ilkeston and urban district of Alfreton, north by the urban district of Matlock, and north-west by the urban district of Wirksworth. The distance from the extreme points north to south boundaries, as the crow flies, is 15 miles, and east to west boundaries 12 miles. During the twelve months under review the expenditure on highways was £5,302, or a total of £35 3s. 10¼d. per mile; but deducting certain amounts paid to the credit of the council, the nett figures were £5,175 and £31 18s. 11½d. respectively. Some 6,300 tons of stone were consolidated with the steam roller, covering an area of 68,200 super. yds. of roadway, and showing a daily average of 350 sq. yds., with 32⅔ tons of stone, each ton covering approximately 11 sq. yds.

PRO PATRIA.

[FOURTH LIST.]

In presenting a fourth list of municipal, engineering and sanitary officials who are taking part in the great war we repeat our request to readers to assist by notifying us of other cases within their knowledge.

Abbot, Thomas L., chief clerk to borough engineer and surveyor, Harrogate (Mr. C. E. Rivers, ASSOC.M.INST.C.E.), 5th West Yorkshire Regiment (Territorials), volunteering for foreign service.

Allan, G. J., engineering assistant, Southend-on-Sea, private, 2nd Battalion London Scottish.

Allaway, J., disinfector, health department, Gloucester, National Reserves.

Annear, R. W., assistant surveyor to the Watford Rural District Council, has enlisted in the 1st London (City of London) Sanitary Company R.A.M.C.T., and volunteered for foreign service.

Brown, D., switchboard attendant, Gloucester electricity department, 5th Battalion Gloucester Regiment.

Brown, J. A., assistant to the Birmingham city analyst, City Battalion.

Burriss, C. H., clerk, borough engineer's department, Southend-on-Sea, private, 1st Battalion City of London Fusiliers.

Cadic, Bernard, pupil of the borough surveyor of Gillingham (Mr. J. L. Redfern) is serving as Lieutenant of the Kent Royal Garrison Artillery (Territorials), Slough Fort.

Canavan, J., Quartermaster-Sergeant, market toll collector, Gloucester, 5th Battalion Gloucester Regiment.

Chapman, A., clerk, borough engineer's department, Southend-on-Sea, lance-corporal, 1st Battalion City of London Fusiliers.

Chesterfield, B. F., assistant surveyor, Alton Urban District Council, with the Hants Territorials.

Clarke, Leonard H., A.R.I.B.A., second assistant to borough engineer and surveyor, Harrogate (Mr. C. E. Rivers, ASSOC.M.INST.C.E.), 5th West Yorkshire Regiment (Territorials).

Crabb, F. J., engineering assistant, Southend-on-Sea, sapper, Fortress Engineers.

Cullum, H. J., engineering assistant, Southend-on-Sea, 2nd Lieutenant, Royal Engineers.

Dale, Dr. J., assistant medical officer of health, Birmingham Corporation, Sanitary Officer, South Midland Division.

Day, E. E., clerk, Birmingham town clerk's department, South Midland Brigade Royal Field Artillery.

Essex, R. C., pupil, city treasurer's department, Gloucester, R.G.H.Y.

Everall, A., clerk, Birmingham town clerk's department, Royal Berks Regiment.

Falcon, L., engineering assistant, Southend-on-Sea, 2nd Lieutenant, 4th Queen's Surrey Regiment.

Fowler, O. K., switchboard attendant, Gloucester electricity department, R.G.H.Y.

Gladwell, Arthur Bennett, engineering assistant, Walton-on-Thames Urban District Council, with the South Midland Brigade, Army Service Corps. He has volunteered for foreign service.

Hadfield, L. E., clerk, Birmingham town clerk's department, Royal Berks Regiment.

Harpur, F., clerk, borough engineer's department, Southend-on-Sea, lance-corporal, 1st Battalion City of London Fusiliers.

Hartridge, N., pupil in the surveyor's department, Maidstone Rural District Council, with the West Kent (Queen's Own) Yeomanry. He has volunteered for foreign service.

Hill, J. R., clerk, Birmingham town clerk's department, South Midland Brigade Royal Field Artillery.

Hunter, J. K., assistant in borough engineer's department, Leigh, Royal Engineers.

James, J., assistant clerk, health department, Gloucester, 5th Battalion Gloucester Regiment.

Johnson, G. J., clerk, city surveyor's department, Gloucester, 5th Battalion Gloucester Regiment.

Kingscott, H. G., second assistant, city treasurer's department, Gloucester, 5th Battalion Gloucester Regiment.

Leggat, Dr. A., medical superintendent, West Heath Hospital, Birmingham Corporation, Lieutenant, 1st Mounted Brigade Field Ambulance, South Midland Division R.A.M.C.T.

Lightbody, Harold, pupil, engineer's department, Carshalton Urban District Council, with the London Rifles (Territorials).

Long, D. E., engineering assistant, Southend-on-Sea, private, 1st Battalion 1st City of London Fusiliers (Reserve).

Maulkinson, H. Y., surveyor to the Mablethorpe Urban District Council, with the 5th (Service) Battalion Lincolnshire Regiment.

Moffat, Miss, matron, Salterley Grange Sanatorium, Birmingham Corporation, matron, R.A.M.C.

Mott, B. G., engineering assistant, Southend-on-Sea, private, 1st Battalion 1st City of London Fusiliers (Reserve).

Pidgen, G., pupil, surveyor's department, Alton Urban District Council, dispatch rider, Royal Engineers.

Pidgeon, J. G., engineering assistant to the borough engineer and surveyor of Bootle, has joined the 6th Battalion King's Liverpool Regiment (Liverpool Rifles).

Rea, W. E., clerk, Gloucester electricity department, 5th Battalion Gloucester Regiment.

Roberts, F. A., clerk, Birmingham town clerk's department, South Midland Brigade Royal Field Artillery.

Roper, W. E., engineering assistant, Southend-on-Sea, private, 1st Battalion 1st City of London Fusiliers (Reserve).

Ross, G. E. H., second assistant, city surveyor's department, Gloucester, 5th Battalion Gloucester Regiment.

Sedgwick, D., assistant sanitary inspector to the Maidstone Rural District Council, with the West Kent (Queen's Own) Yeomanry. He has volunteered for foreign service.

Spring, Dr. D. M., medical superintendent, Little Bromwich Hospital, Birmingham Corporation, Captain, 1st Mounted Brigade Field Ambulance, South Midland Division R.A.M.C.T.

Tait, W. L., borough surveyor of Sudbury, Lieutenant, D Company, 5th Battalion Suffolk Territorials.

Thorby, P. G., engineering assistant, Southend-on-Sea, private, 7th Middlesex.

Torr, H. L., engineering assistant, Southend-on-Sea, private, 1st Battalion 1st City of London Fusiliers (Reserve).

Torrance, Dr. W. T., medical superintendent, Witton Hospital, Birmingham Corporation, Lieutenant, 1st Mounted Brigade Field Ambulance, South Midland Division R.A.M.C.T.

Ward, G. J., engineering assistant, Southend-on-Sea, private, 1st Battalion 1st City of London Fusiliers (Reserve).

Warner, P., late clerk, surveyor's department, Alton Urban District Council, with the Hants Territorials.

Warren, C. H. Noble, clerk, borough engineer's department, Southend-on-Sea, private, 1st Battalion City of London Fusiliers.

Weighill, F. W., clerk to borough engineer and surveyor, Harrogate (Mr. C. E. Rivers, ASSOC.M.INST.C.E.), with Royal Army Medical Corps.

Wicks, W. E., clerk, borough engineer's department, Southend-on-Sea, private, Oxford Light Infantry.

Wortley, R. K., engineering assistant, Southend-on-Sea, private, 1st Battalion 1st City of London Fusiliers (Reserve).

Mr. Eric F. Wettern, director of Wettern Brothers, Limited, has been accepted for service in the Engineering Section of the Royal Naval Division.

The Acceptance of Tenders. At a meeting of Prestatyn District Council on Monday Mr. E. T. Williams asked why the tenders of local contractors for pipe-laying had not been accepted when, in one case, the difference in the cost was only 4s. 6d. in £20. The surveyor said that the work was almost completed. Mr. Williams said it was most unusual that minutes of committees should be brought forward for confirmation when, owing to contracts having already been let, they had no option but to confirm them. Here was a case where they might decide to alter the committee's decision, and were unable to do so as the work was almost completed. He thought no contracts should be given out until the committee's recommendation was confirmed by the whole council.

BRIDGE BUILDING IN MIDDLESEX.

A BATH ROAD IMPROVEMENT.

The accompanying photographic views show the bridge which carries the main Bath road across the river Crane in the county of Middlesex. The existing structure is about to be demolished to make room for a new bridge with a carriageway of a much greater width than the present one.

The old three-arch bridge (erected about 1780, with its awkward road lines and somewhat steep gradients, will be taken down and replaced by a bridge of a more substantial design, as illustrated, for present-day traffic.

There will be two arches, instead of three as at present, with the necessary wing walls and approaches.

The width of the new bridge between parapets will be 50 ft. (in place of about 21 ft. as at present), with a carriageway 38 ft. wide (in place of about 19 ft.). The gradients of the approaches will be about 1 in 45, that portion of the carriageway crossing the bridge being practically level.

The new bridge has been designed by the county engineer, Mr. H. T. Wakelam, M.INST.C.E., and is being carried out by him, concurrently with other extensive bridge work which he has in hand in other parts of the county.

Old Cranford Bridge, Middlesex.

Carriageway of Old Cranford Bridge.

CHISWICK RIFLE RANGE.

The Chiswick Chamber of Commerce recently approached the Chiswick District Council, asking if they could loan them some building for the purpose of constructing a rifle range for the use of ratepayers during the continuance of the war. A special meeting of the Vacation Committee was held on September 7th, and permission was given to convert a large open corrugated iron cart shed adjoining the river depot stables. A sub-committee was formed, donations were made, and Mr. E. Willis, ASSOC.M.INST.C.E., the engineer to the council, acted as honorary surveyor and prepared a specification and drawings, obtained tenders and the necessary sanction of the War Office, and promised, if possible, to have the whole scheme in working order within three weeks. This has been done at a cost not exceeding £120. The rifle range was formally opened yesterday by the chairman of the Chiswick Council, Mr. James Leith, J.P. The whole of the work has been executed by local labour, and provision has been made for twelve targets, with full regulation distances at the firing points and a range length of 25 yds. It is intended to charge no entrance fee or subscription, any ratepayer, either male or female, being entitled to use the range at certain hours, the only condition being that the ammunition shall be purchased on the range.

(Mr. H. T. Wakeham, M.Inst.C.E., County Engineer, Architect.)

SEWAGE DISPOSAL AT LEEDS.

A YEAR'S WORK AT KNOSTROP.

[illegible] Mr. Oscar A. Hart, M.Inst.C.E., [illegible] Engineer at Leeds, to the Sewage Committee [illegible] the [illegible] ended March 31st, 1914, [illegible] works.

Dealing with the operations at the Knostrop works, Mr. Hart states that 41,717,000 gallons of sewage were treated in tanks in addition to the normal precipitation during the year, being an average volume of 2,279 gallons per day for the two works, which amounts to 35 gallons per head per day, for a population of 65,289 persons estimated to be connected to the works. This volume is 4·6 per cent less than the volume pumped and treated during the same period of the previous year. The total rainfall in the city for the year computed from the average of five rain gauges amounted to 30·82 in., as compared with 32 in. during the previous year. After allowing for a stoppage of thirty-two days during the recent strike, these figures show that the decrease in rainfall of 1·18 in. during the year has resulted in a decrease of an average volume of 1,728,780 gallons of sewage being pumped and treated per day when compared with the records of the previous year.

The total cost of pumping the whole of the sewage treated during the year, exclusive of interest and sinking fund on capital, amounted to £1,384, which is equivalent to 5s. per 1,000,000 gallons of sewage lifted an average of 12 ft. high, or 5d. per 1,000,000 gallons per foot of lift. Some 3,148 tons of coal were consumed by the boilers, including locomotives and steam cranes. The volume of town's water used upon the works during the year amounted to 6,223,255 gallons, which is equivalent to 8·8 lb. of water per lb. of coal consumed. The coal used at the boilers during the past year consisted of screened nuts supplied by the Low Moor Company, Limited, under contract at the price of 13s. per ton.

From the sewage screens 1,106 tons of garbage have been removed—3¼ tons per day, or 3⅞ cwts. per 1,000,000 gallons of sewage treated. The cost of [illegible] in wages and power was £319, or 1s. 2d. per 1,000,000 gallons of sewage treated.

Some 787 tons of grit were deposited and removed from the pits by the steam crane and Priestman grab, being an average of 2¼ tons per day, or 2 cwt. of grit per 1,000,000 gallons of sewage treated.

The precipitant used during the year has been lime added to the sewage in the form of milk of lime, and to the amount of about 10 parts per 1,000,000 throughout the year. The supply of lime was obtained at the rate of 14s. 2d. per ton. The total amount of lime used for chemical precipitation was 736 tons, and the cost of this process amounted to £951, being 3s. 5d. per 1,000,000 gallons of sewage treated.

The total volume of sludge deposited in the tanks during the year amounted to 23,504,210 gallons, or 115,422 tons, containing on the average 91·4 per cent water, and which was reduced by settlement in the sludge tanks to 89 per cent water before being pressed. The quantity of sludge cake produced by the presses amounted to 36,162 tons, which is equivalent to a volume of 64,395 gallons of liquid sludge, or 99 tons of sludge cake per day.

The amount of lime added to the sludge for pressing purposes amounted to 1,228 tons, being about 1 per cent by weight. These figures in comparison with the previous year show a decrease in the amount of sludge dealt with to the extent of 10·4 per cent. The total working cost of tank cleaning, including removal of detritus, amounted to £999, being 3s. 7d. per 1,000,000 gallons of sewage treated, and the total working cost of sludge pressing amounted to £3,069, being 11s. 1d. per 1,000,000 gallons of sewage treated, which is equivalent to 1s. 8d. per ton of cake produced.

During the year 12,381 tons 18½ cwt. of sludge cake were consigned from the works to farmers for manurial purposes, being an increase of 2,777 tons 3½ cwt. upon the figures of the previous year. The balance of 23,780 tons of sludge cake was removed on the narrow gauge railway which connects the sludge press house with the site of the low-lying lands on the Thorpe Stapleton estate, and there tipped and covered over with a layer of soil. The total cost of sludge disposal amounted to £1,531, less the receipts from the sale of cake, £157, making a nett total cost of £1,373 19s. 7d., which is equivalent to 4s. 11d. per 1,000,000 gallons of sewage treated, or 9·118d. per ton of cake produced.

The total working cost, exclusive of interest and sinking fund, during the year at Knostrop sewage works amounted to £11,773, as against £12,273 for the previous year. This is equivalent to £2 2s. 5d. per 1,000,000 gallons of sewage treated at the works, as against £1 16s. 7d. per 1,000,000 gallons for the previous year.

The increase of cost of 5s. 10d. per 1,000,000 gallons of sewage treated for the year is in the main accounted for by the stoppage of the sewage purification work during the thirty-two days of the strike previously referred to, which in conjunction with the diminished volume of flow caused by the absence of rainfall during the year has reduced the average total volume pumped and treated on the works by nearly 1,750,000 gallons per day. The standing charges could not be correspondingly reduced; therefore the nett cost per 1,000,000 gallons of sewage treated throughout the year has inevitably shown an increase of 5s. 10d., compared with the previous year's figure of £1 16s. 7d. per 1,000,000 gallons of sewage treated. The total cost, however, of running the sewage works for the past year shows a reduction of £500 when compared with the figure of the previous year.

The average percentage purification during the past year expressed in terms of the amount of suspended solids eliminated from the crude sewage was 90·1 per cent, as compared with 92·7 per cent for the previous year. The average strength of the crude sewage gauged upon the amount of oxygen absorbed in four hours at 80 deg. Fahr. is shown to have increased during the past year by 10·80 per cent as compared with the results of the previous year.

The Sewerage Committee recognise that the cardinal feature of their efforts in sewage purification consists in effectively preventing the solid matter contained in the dry-weather flow of sewage from being discharged into the river Aire, and they also recognise that before further purification can be effected to the dry-weather flow it will be necessary to construct and bring into use the continuous filters or bacteria beds which were authorised by the sewage works extensions of the Leeds Act of 1908. Until this is accomplished there cannot be any material change in the nature of the effluent discharged into the river Aire from our Knostrop works.

EXPERIMENTAL WORK.

The report contains records of experiments in the treatment of chemically precipitated tank effluent upon a percolating filter with fixed jet distributors, and in settling out the suspended solids or humus contained in the filter-bed effluent by passing them through an upward flow tank. These experiments, which were referred to in the report for 1912-13, are being conducted in order to determine the effect of still further decreasing the period when tank effluent is applied to the percolating filter and increasing the intermittent period of rest to twelve hours out of the twenty-four.

The construction of the percolating filter has not been in any way altered. Six fixed sewage jets, each ⅛-in. internal diameter, were used for distribution in order to get a rate of tank effluent applied to the surface of the filter of 400 gallons per square yard per twenty-four hours. This rate was applied to the bed daily from 6 a.m. to 6 p.m., and the filter then allowed to rest during the ensuing twelve hours; hence the volume of precipitated tank effluent treated per day was the same rate (200 gallons per square yard per twenty-four hours) as that which was obtained in the experiments described in the last report.

The filter was worked continuously without any stoppage from May 14, 1913, to May 1, 1914, save for the enforced rest during the strike of the workmen, when it rested from December 11, 1913, to January 19, 1914. The filter worked satisfactorily throughout the year; there was very little trouble experienced from the plugging of the jets, and little fungoid growth made its appearance on the surface of the filter. During the month of April a small amount of pooling occurred on a portion of the surface area of the filter where the heaviest proportion of dose of tank effluent fell upon it. This pooling, however, invariably disappeared when the surface was forked over.

The final effluent from the humus tank yielded an average figure of 1·41 parts per 100,000 of "oxygen absorbed from solution in five days." This result is well within the requirements of the proposed standard of the Royal Commission on Sewage Dis-

posal (2 parts per 100,000) in this respect, but it is admitted to be rather too high in suspended solids viz., 3·9 as compared with 3 parts allowed by the proposed standard. Of about fifty samples of filter-bed effluent examined, only 10 per cent were putrescent in four days at 80 deg. Fahr. The fixed jets, each pegged up on an average eighteen times in 330 days, which is considered to be an excellent result, and to show that it is practicable to treat Leeds tank effluent after chemical precipitation by means of fixed jet distributors without incurring practical difficulties by jet plugging with solid matter.

Summarising the results of the three methods of applying chemically precipitated tank effluent to a percolating filter 6 ft. deep by continuous flow and intermittent flow in dosing, the following results have been obtained over the last 2½ years:—

(Parts per 100,000). Rate of Treatment:—200 gallons per square yard per day.

Method of application.	Period of time of experiment.	Percentage purification calculated on			Oxygen absorbed from solution in 4 hrs.	Nitrogen as nitrates.
		Albuminoid ammonia.	Oxygen absorbed in 4 hrs.	Suspended solids.		
1. Continuous flow ...	October 28, 1911, to April 17, 1912	63·7%	69·9%	59·8%	·38	1·54
2. Dosed for 16 hrs., resting 8 hrs.	April 24, 1912, to April 30, 1913	64·5%	64·1%	60·0%	·46	1·21
3. Dosed for 12 hrs., resting 12 hrs.	May 14, 1913, to April 30, 1914	60·9%	60·3%	60·2%	·50	·58

These results prove that, as the dosing period is reduced, the effluent slightly deteriorates in quality. This is most noticeable in the nitrification of the effluent, but it still remains non-putrescent. The intermittent dosing possesses the advantage that it has been proved to counteract the difficulties which arise in continuous dosing by growths appearing to a large extent on the surface. This is effectively prevented by intermittent dosing, and therefore it has been proved to be possible to treat a larger volume of sewage by intermittent dosing than by continuous feed, the difference amounting to not less than 10 per cent, owing to the frequent rest period necessitated to check the growth forming upon the filters by continuous feed.

The results obtained from dosing for a period of sixteen hours and subsequently resting eight hours are distinctly better than the results obtained from dosing the bed twelve hours and resting twelve hours, the advantage being about 4 per cent in purification on the albuminoid ammonia and oxygen absorbed figures, and almost 20 per cent in the suspended solids figure, the amount of nitrates and nitrites in the effluent being much in favour of a two-thirds dosing time and one-third rest when compared with a half dosing time and a half rest.

These experiments have been of the highest value to the committee in enabling them finally to determine from experience the best method of application of tank effluent to the continuous filters by means of fixed jets, and this branch of research work can now be regarded as having been determined.

A Useful Sanitary Service.—The mobilisation of the Territorial Force and the active recruiting for the Regular Army have led in London, as probably elsewhere, to the concentration in buildings of large numbers of men who as a result are in some instances, perhaps often, inadequately supplied with the opportunities for personal cleanliness to which they have been accustomed in their own homes. To meet this temporary difficulty (says the *Lancet*), a number of the London sanitary authorities have permitted soldiers in uniform to make use of the public baths in their districts without charge. In some instances, where uniform has not yet been provided, the written statement of an officer has been accepted that those wanting baths belong to the military force, and again the assurance of the recruiting officer has enabled recruits to be cleansed before being medically examined. This is a valuable service which deserves recognition, and it would be a great gain if the action of the city and borough councils in London, who have thus aided the military authorities, were extended throughout the whole of the county of London. Indeed, why should not these opportunities for cleansing be made available in all districts for soldiers and recruits, whether with or without uniform?

TOWN PLANNING IN THE UNITED STATES.*

By C. Mulford Robinson,
Rochester, N.Y.

American city planning seems clearly to be getting away from the draughting board, or, rather, the draughting room is no longer its central office. The planner of towns must often have recourse to his draughting table, of course, however many the hours he spends at his desk, in his library, or on the streets; but there was a time—not so long ago—when a city plan, as understood in America, was a thing of star-points that sang together in unison, as a firmament showing his handiwork; of French curves; of quadrigas, pylons, and fountains; of temples and palaces, suggesting dreams of a prix-de-Rome.

To-day, if one may judge by the published plans of the last eighteen or twenty months, city planning is not a showy affair, but a sober one. It requires thoughtful discussion, not wonderful pictures; it has more to do with laws and ordinances than with architectural compositions, and the manner of presentation is not as important as the matter. In short, not fine books, but better cities and towns is the goal. There is more consulting of responsible officials, and the whole thing is coming down to earth out of the roseate clouds.

For all the much criticised standardisation of the earlier American street plans, the town planner, more on the lookout for differences than likenesses, finds each problem a new and fresh one, demanding original solution. Whatever there may be to fear in the town planning wave that to-day is sweeping the United States, the bogey of a loss of town individuality cannot yet justify an anxious thought.

Once this is duly recognised, it is interesting to note that the emphasis which at first was on civic centres and then on park systems, seems in these latest reports to be setting strongly toward concern for circulatory problems. The convenient handling of street traffic in main highway systems, and after that a more efficient development of railroad terminals, are subjects that each report takes up with earnestness. This is in response, no doubt, to the growing congestion of all kinds of traffic, and especially to that expansion of street traffic which has come with the automobile. The modern town is confronted by new conditions in the street traffic's speeding up, its growth in volume, and its increase in complexity. As to the emphasis of the future, if one may venture a guess from the signs that are given in these late reports, it is to be on industrial efficiency, on harbour improvement, and on housing. The latter, which in the British Isles is considered so earnestly, in the United States has only just begun to be thought about.

Since each change of emphasis carries standards higher, so that thereafter there is no slipping back to the old neglect, the American town plan of the near future should be an exceedingly comprehensive and well-rounded study, in which civic centres, parks, and recreative provision, traffic accommodation, transportation, industrial efficiency and better housing will each have due consideration. The only danger, if danger it may be called, is that the standard will be placed so high that no single town planner, and no single town plan, will venture to attempt so much.

Meeting Postponed.—As we go to press we learn that the projected meeting of the Royal Sanitary Institute at York on the 24th inst. has been postponed.

* Extracts from paper read at the annual general meeting and conference of the Institution of Municipal and County Engineers at Cheltenham.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to the Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Communications are invited to suggest questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

The premium for September is awarded to

Mr. N. S. Jeffery,
24 Westerdale Villas,
Darlington,

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

Readers' answers are invited to the following questions.

424. Mechanics.—Distinguish between kinetic and potential energy, and show how they are measured in the case of a body falling from rest. Show that, if a body be let fall from rest, its energy remains constant till it reaches the ground.

425. Strength of Materials.—Explain why the resistance of a long strut depends more on the stiffness of the material than on its strength.

426. Geodesy.—Give a formula for computing the difference in height between two stations by means of the observed heights of the barometer, and state the meanings of the symbols used.

427. Testing Drains.—What tests should be applied to house drains before being passed? Describe any apparatus used.

428. Building Construction.—Draw a section through the eaves of a tiled roof, 45 deg. pitch, on a 14-in. wall. Show all details, including laths, sprockets and guttering.

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

422. Building Construction.—The earth in front of a semi-basement to a house has to be supported for a depth of 6 ft. Give a section of a suitable retaining wall, and prove its stability by a graphic diagram.

Fig. 1 represents the section of the wall, and Fig. 2 is the graphic proof of its stability. In Fig. 2 we

Fig. 1.

consider only that portion of the wall which is above the lower ground line, as it would be a point F on the lower ground line, about which the wall would tend to turn. Many tables give the weights of brickwork and earth to be about the same, and as the wall is to be of brick, we can consider its section to be AGEF, the weight of the section of earth BGDC rests upon CD.

Draw EH = angle of repose = 34 deg. From G draw GJ, so that angle JGE = 2×34 deg. = 68 deg. From point J, and with JE as radius, draw semi-circle ELK.

Draw JL at right angles to EK. With centre E

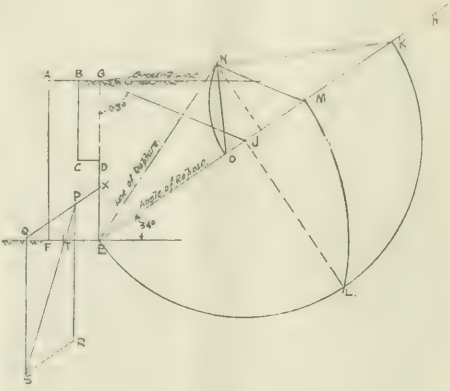

Fig. 2.

draw arc LM. From M draw MN parallel to JG. With centre M, and radius MN, draw arc cutting KE in O. Join OH.

Now triangle ONM is called the "pressure triangle" that is to say, its area multiplied by the weight of a cubic foot of earth represents the pressure of the wedge of earth 1 ft. wide between the line of rupture YE and the face GE.

It should be noted that this particular construction is inapplicable to angles of repose above 45 deg., when another construction has to be resorted to.

We must now find the weight of the wall acting through the centre of the wall, as we are considering the section BG DC to be part of it; also the weight of the earth retained as given by the "pressure triangle." This force acts through a point × ⅓ GE from the bottom, and parallel to the angle of repose (this takes into account the friction between the earth and the wall; otherwise it would be horizontal).

Weight of wall = W = 1′ 10½″ × 6′ × 112 lb. = 1,260 lb.

Weight of earth = P = $\frac{2'11 \times 3'6'' \times 112}{2}$ = 571 lb.

Note. Take the weight of cub. ft. of brickwork & of earth = 112 lb.

Now draw from the point P, which is the intersection of the lines of action of the two forces, PQ = 571 lb. to some scale, and PR = 1,260 lb. to the same scale. Complete the parallelogram QPRS, and we get the resultant of the two forces PS cutting the base of the wall at T within the middle-third of the base. This is necessary, else "creeping" will occur at E, owing to the back of the wall being in a state of tension. (N. S. J., *Darlington.*)

423. Sewer Construction.—Show by sketches (plan and section) the junction of a 3-ft. and a 5-ft. brick barrel sewer.

The annexed sketches give the plan, cross-section and longitudinal section required. The drawings

The Surveyor
And Municipal and County Engineer.

5-ft. sewer, which is not in the centre of the cross-section CD. To avoid a rough edge at the junction, and to form a good bond, a bull-nosed granite sill is fixed as shown. A blue-brick invert is shown to each sewer, and the intervening space between the top of the 3-ft. sewer and the under side of the 5-ft. sewer is filled up with 9-in. brickwork, as shown in the two sections. The under sides of the sewers are filled in with concrete. (T. W. P., *Bexhill-on-Sea.*)

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.
—Massinger: "The Fatal Dowry," Act ii., 2.

NOT GERMAN.

To the Editor of The Surveyor.

Sir,—We should be very grateful if you would publish the subjoined copy of correspondence between a corporation and ourselves.—Yours, &c.,

(For Wettern Brothers, Limited),
Herbert L. Wettern, Director.

16 Water-lane,
Great Tower-street, E.C.

* * * *

[copy.]
City Engineer's Department,

September 23, 1914.

Gentlemen,—I am in receipt of your letter of yesterday's date. Before I go any further into this matter, I am requested by the committee to ask you to be good enough to let me know who are the shareholders in your firm.

It is believed that your business is run principally with German money.

You can quite understand that, with present conditions, we English people are anxious to give preference to firms employing British labour and financed by British capital.

Perhaps you will kindly let me have this information.—Yours truly,

City Engineer.

To Messrs. Wettern Brothers, Limited.

* * * *

City Engineer,

Dear Sir,—On behalf of my firm, I reply personally to your letter. Any accusation that our business is run principally with German money is absolutely unjustified and unfounded. Were such a statement to be publicly made, we should without compunction bring an action, so that the whole of our books, deeds and statements could be publicly proved and examined by the Court, in order that any such German stigma could be forthwith refuted.

History.—The history of our firm is as follows: My grandfather (maternal)—Mr. Blichfeldt—a Norwegian, founded this business in 1851. My father, who succeeded him in 1882, naturalised himself the same year (1882), and thereby became a British subject. He died in 1902. My two brothers are associated with me, and we are all born and bred Britishers, and have never lived out of England. In 1911 the business we had succeeded to as Blichfeldt & Co. we turned into a limited liability company, under the name of Wettern Brothers, Limited.

Directors and Shareholders.—The enclosed, which can be verified at Somerset House, sets out in full the directors and shareholders in our business. All the gentlemen holding shares are our employees here, who have been with us a number of years. Needless to say they also are all Englishmen.

Shareholders.

Herbert L. Wettern (Director).
Fred. R. Wettern (Director).
Eric F. Wettern (Director).
Mrs. R. M. Wettern.
A. Percy Beaumont (Secretary).
Geo. H. Jeff (Accountant).
John Wm. Penny (Manager).
John Palmer (Manager).
Alfred A. Bradley (Assistant Accountant).

Our Trade.—We have interests as quarry owners and agents in Cornwall, Scotland, Norway, and Belgium. We have no German trade or interests, and

are thankful to say we have not a friend (personal or business) in Germany.

Capital.—There is not one penny of German capital or even of foreign capital in our business, and there never has been. It is entirely British, being in our hands and put up by ourselves.

If there is any further information I can give you I shall welcome your enquiries. I should be quite willing to appear before any of your committees should you wish it, to answer any further questions or to refer you to solicitors, bankers, mayors or engineers of other boroughs and councils who have dealt personally in business with us since we started. . . .

May I ask you to read or send this letter to your [illegible] that we may keep our reply?

Yours faithfully,

(Signed) Herbert L. Wettles.

PREMATURE BURIAL.

To the Editor of The Surveyor.

Sir,—With reference to the "grim possibility of premature drive" alluded to in your excellent leader of 18th inst., may I say that of all the existing evils which exist, from a humane point of view, is more important than that for the prevention of burying people alive? To those who have not studied the facts, and to others who are sceptical as to the existence of trance, catalepsy, or other death-simulacra, sometimes known as human hibernation, such a movement appears unnecessary, Utopian, and a waste of energy. On the other hand those who have carefully examined the evidence brought together by numerous authorities, including professors of medicine, hospital surgeons, and scientific observers, lose their scepticism in the amount of cumulative evidence which besets the path of their researches. Narrow escapes from interment alive, it may be truly said, are almost of everyday occurrence all the world over (especially in countries like France, Spain, Portugal, Italy, Russia, and Turkey, where apparent death is more frequently followed by prompt burial than in these islands), the discoveries often being accidentally made during the preparations for the funeral. It may be reasonably inferred from these cases that some, if not many, do not escape, and are buried while in a state of suspended animation. This catastrophe is most likely to occur on the battlefield, and it is much to be feared that many a wounded soldier is buried alive.

Every session the Association for the Prevention of Premature Burial presents to Parliament a Bill to prevent these terrible tragedies by reforming the present very haphazard, unscientific, and dangerous system of death examination and certification. Free literature on this momentous subject will be sent on receipt of a stamped addressed envelope.—Yours, &c.,

Jas. R. Williamson.

180 Chedington-road,
Upper Edmonton, N.
September 24, 1914.

Pudlo.—The architects for the Sedbergh Grammar School swimming baths, which have just been completed, speak very favourably of the efficacy of Pudlo in the treatment of the cement for these baths. There has been no trouble since they were built, either of the ingress of soil water or seepage.

Edinburgh Road Improvements.—Several important road improvements are being carried out under the direction of the Edinburgh city road surveyor, Mr. Sim. The widening at West Savile-terrace in conjunction with the widening at Blackford-avenue and Charterhall-road is well advanced. The work at Blackford-avenue is completed, and the corner has been taken off Charterhall-road, which will allow of the road being widened at this point westwards to a width of 60 ft. At West Savile-terrace the filling up necessary to the diversion is almost completed, and when this is done this road and Charterhall-road will be one continuous line. At Milton-road great improvements have been made and projected, some of them being caused by the new Lothians Railway line. Seafield-road is being raised from a point near the level crossing at the Old Loaning to a point about ½ mile further along, to allow of two overhead bridges being built so that the necessity of having level crossings will be done away with.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is there any accounting for tastes? Is it not strange that so many young and active men should prefer to act as guards and in other capacities on our tubes and underground railways instead of serving their country in the field? Surely a soldier's life is much more healthy, and the risk of death cannot be greater.

* * * *

Is it not very satisfactory to hear that so many young members and students of the Institutions of Civil, Mechanical, and Electrical Engineers have joined the new Divisional Engineer Units and Signal Company of the Royal Naval Division recently formed by the First Lord of the Admiralty? Is it not splendid the way in which the upper and middle classes of this country have responded to the "call to arms"?

* * * *

Will not the training received by the men who join the above-mentioned corps be of the greatest value to them even if they should not be called upon to go to the front? Would not the knowledge they will acquire of "men and materials" be of incalculable value to them in after life, when they again resort to "civil" practice?

* * * *

Is there not much food for thought in Mr. Bertram Kershaw's excellent article in the issue of The Surveyor of the 16th ult.? Does he not rightly point out that the freedom from sickness among soldiers in the field is very much due to the greater individual knowledge of the soldier to the needs of personal sanitation, and does not this equally apply to all civil populations? Is not sanitary "education" of even more importance than "sanitary legislation," and "personal cleanliness" of the soldier of more importance than "General Regulations"?

* * * *

Is it a fact that in some districts in England where there has been a great influx of troops and recruits difficulties are being experienced with regard to the water supply, and even the sanitary arrangements? Where this is the case could not some well-known engineer of experience at once be called in by the War Office, or the responsible department, to investigate these cases and report on any temporary remedial measures that might be taken?

* * * *

What is to be done with the German prisoners, of whom there are already a great number in this country, and of whom we hope to "welcome" more before we have done with Germany? Could they not be employed on some useful national works of land reclamation, or similar improvements? Can they be kept in health otherwise if they are obliged to lead idle lives during the term of their imprisonment? Are not the Germans making their prisoners work very hard on various useful works?

* * * *

Could not the members of local authorities, where they have not already done so, arrange for meetings of their constituents, and give them a series of addresses on the reasons why this country was obliged to go to war? Is not such explanation badly needed in some parts of the country?

* * * *

Who can read that magnificent poem "The Day" without being stirred to his inmost heart by its genius and beauty? And when we realise that it was written by a railway porter at Bath, Mr. Henry Chappell, can we not understand the well-known saying that "War always brings out the best in every man who has got any 'best' about him"?

A Glossary of Road Terms (By H. Percy Boulnois, M.Inst.C.E., St. Bride's Press, Limited, 24 Bride-lane, E.C., Price 2s. nett).—The movement towards standardising the principal roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road terms in use in different districts, and Mr. Boulnois has compiled a glossary with the hope that it may form a basis for such a correlation.—*Times Engineering Supplement.*

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible*

INQUIRIES HELD.

Bath T.C. (September 22nd. Mr. Edgar Dudley). £18,000 for the purchase of leasehold interest in the Grand Pump Room Hotel and the freehold of certain properties adjoining. It was asked that the period of repayment of the proposed loan should be thirty years. The Pump Room Hotel, it was stated had been closed for a long period, and the property as it now stood was a blot in the centre of the city, and the corporation lost directly and indirectly in many ways.

Clayton West U.D.C. (September 24th. Mr. R. G. Hetherington). £9,739 for a sewerage and sewage disposal scheme. Mr. A. Brook Hirst, of Huddersfield, described the scheme and said that the council were entitled to take credit for the fact that they had already expended out of current rates nearly £1,000 on account of sewerage improvements made in anticipation of the present scheme. The inspector said it was the desire of the authorities in London to facilitate this and other similar schemes in order to alleviate the distress caused by unemployment.

Kidderminster R.D.C. (September 23rd. Mr. F. O. Stanfordi). £1,500 for a water supply scheme for Wribbenhall. It was explained that the council had arranged with Bewdley Town Council to take water in bulk at 4½d. per 1,000 gallons, the Bewdley waterworks being in Wribbenhall parish and the main passing through the village.

Marsden U.D.C. (September 8th. Major J. Norton). £7,384 for the purposes of sewage disposal. —The inspector said the scheme was an amended one, and he understood the council wished to use unemployed labour in carrying out the work. The clerk (Mr. J. W. Piercy): That was a suggestion of the West Riding Rivers Board, but the council wish to have the work done by contract. Mr. A. Robinson (chairman of the council): Most decidedly. There was little unemployment in Marsden, Mr. Robinson added, though mills were working short time. Dr. Wilson (chief inspector of the Rivers Board) said they did not wish to dictate to the council, but their suggestion regarding the use of unemployed labour was made on receipt of a circular from the Local Government Board. Perhaps the inspector would say that the plans were generally likely to be approved, and then the contracts could be prepared and no time lost in getting the work done during the winter. The inspector: We shall not delay the scheme five minutes as soon as we get the information we want. The inquiry then closed.

Plymouth T.C. (September 22nd. Mr. P. M. Crosthwaite). £1,900 for the provision of railway siding accommodation on the Prince Rock estate.— Mr. J. Paton, borough surveyor, submitted drawings and plans of the scheme, and it was explained that the proposed siding would provide access for cattle for transport purposes, a convenience much required; also for general purposes it would be convenient in connection with the whole estate of the corporation, for instance, in regard to the conveyance of stone for highway purposes. Further, it would be available for the electricity works.

St. Albans T.C. (September 11th. Mr. W. M. Cross).—£48,977 for works of sewerage and sewage disposal in connection with the extension of the city of St. Albans, and £489 for the provision of public conveniences.—Mr. H. Howard Humphreys submitted details of the scheme and the alterations that it is proposed to make at the sewage farm to deal with the sewage from the extended area. It was intended, he stated, to drain a population of about 7,000 extra persons to the works, and the population of St. Albans itself had increased, so that the scheme covered rather more ground than was covered by the estimate of £45,250 mentioned at the city extension inquiry. The old city was sewered almost entirely upon the separate system, and that system would be followed in the added area, the intention being to exclude all surface water from the foul sewers. The gradients throughout the scheme were very good; the only part that could be thought at all flat was that from the golf links to the purification works. He did not, however, anticipate any trouble there. The sewage would be treated by double filtration throughout, and the sludge would be used upon the land as at present. In answer to Mr. A. J. Hampton, of the Thames Conservancy, Mr. Howard Humphreys said that no storm water overflow was proposed. In answer to a question by the inspector, Mr. A. Eade, manager of the sewage farm, said that at present the pumps were working about eighteen hours a day. Previous to the troops coming to St. Albans they were working about seventeen hours. In winter they were sometimes running full time, but the average was twenty-one hours.

Sedbergh R.D.C. (September 24th. Mr. R. G. Hetherington).—£911 for the purpose of providing a water supply from Millbeck Spring for the village of Dent.—It was explained that the cost would probably be increased, as materials had become enhanced in value of late. The clerk to the council said the majority of the Dent ratepayers were opposed to the scheme, as it would only benefit the people living in the village itself. But the opposition seemed to have come to the conclusion that the establishment of the scheme was a foregone conclusion, and offered no formal evidence.

South Dublin R.D.C. (September 24th. Mr. A. D. Price).—£1,500 for the purpose of providing water supplies at Knocklyon and at Rathfarnham.— Mr. T. J. Byrne, clerk and engineer to the council, said the intention was to get a supply of water from the Rathmines system and make the connection at Ballyboden. There was a recommendation from the medical officer of health as to a necessity for an ample supply of water in these portions of the district. It was proposed to borrow the money from the Commissioners of Public Works, to be repaid in thirty years, the contributing district being the rural area. The inspector asked if this scheme would complete the water supply to the whole rural district. Mr. Byrne said there was an area in Chapelizod which stood in need of a supply, but that question was not in contemplation by the council at present.

Stourbridge U.D.C. (September 16th. Mr. R. H. Bicknell). £400 to purchase property at the junction of New-street and Bell-street for street improvements, and £650 for the provision of public conveniences.— The surveyor, Mr. F. Woodward, submitted the necessary evidence with respect to both schemes.

Swansea T.C. (September 22nd. Mr. A. G. Drury).—£10,000 for the extensions of water mains, and £629 for widening Dolfin Bridge, Morriston.—It was explained that the Local Government Board had in 1913 sanctioned the raising of a similar sum for prospective extensions of the water mains covering a period of three years, but this had been expended sooner than was anticipated. With respect to the proposed bridge widening, the proposal was for the corporation to pay the cost of widening the bridge to 33 ft., including a 7-ft. footpath, the Great Western Company at the same time to carry out a lengthening at an estimated cost of £354.

APPLICATIONS FOR LOANS.

Barrowford U.D.C. — £2,200 for private street works.

Beverley R.D.C.—£10,000 for draining the villages of Elloughton and Brough.

Bispham U.D.C.—£12,000 for private street works.

Brighton T.C.—£15,000 for the Loder-road school.

Coventry T.C.—£25,005 for the erection of a technical school, and £10,150 for school extension.

Edmonton U.D.C.—£1,250 for road widening.

Enfield U.D.C.—£2,820 for the erection of lodges and public conveniences.

Harpenden U.D.C.—£331 for sewerage works.

Hayward's Heath U.D.C.—£500 for laying a portion of the new cemetery.

Holmfirth U.D.C.—£7,150 for a new reservoir.

Jarrow T.C.—£5,200 for the Field-terrace improvement.

Merthyr T.C.—£250 for the construction of a bowling green.

Okehampton T.C.—£105 for works of water supply.

Oswaldtwisle U.D.C.—£2,213 for works of water supply.

Penzance T.C.—£5,385 for a housing scheme.

St. Annes U.D.C.—£6,500 for open-air sea-water baths.

Sandown U.D.C.—£245 for road improvement.

Staines U.D.C.—£1,100 for private street works.

Sutton (Surrey) U.D.C.—£1,000 for road reconstruction.

Westbury R.D.C.—£5,000 for the erection of workmen's dwellings.

LOANS SANCTIONED.

Abergele U.D.C.—£260 for works of sewerage.

Barnsley R.D.C.—£1,728 for sewerage works.

Barrow T.C.—£13,261 for a new school.

Belfast T.C.—£1,130 for sewerage extensions.

Blaenavon U.D.C.—£12,000 for a housing scheme.

Bournemouth T.C.—£60,000 for a pavilion on the sea front.

Brighton T.C.—£8,000 for the purchase of 164 and 165 Western-road for the purposes of street improvement.

Briton Ferry U.D.C.—£1,800 for laying out a public park.

Castlebar U.D.C.—£3,000 for works of water supply.

Clones U.D.C.—£2,700 for works of drainage.

Cosford R.D.C.—£500 for water supply works at Whatfield.

Gravesend T.C.—£1,615 for street improvements.

Kettering Joint Hospital Board.—£1,500 for constructional works.

Launceston T.C.—£5,000 for workmen's dwellings.

Liverpool T.C.—£1,612 for road widening, £997 for a new footpath, and £20,679 for the erection of a school.

Mansfield T.C.—£2,200 for street improvement.

Newbury T.C.—£4,000 for works of wood paving and concrete foundations, and £225 for automatic raking gear at the pumping station.

Penybont R.D.C.—£8,494 for a drainage scheme.

Tilbury U.D.C.—£4,960 for the purchase of land for housing purposes, South Ward; £2,630 for street works; £3,125 for surface-water drainage, sewers, and channelling; £654 for land for a new depot; £1,594 for land for additional allotments; and £3,890 for land for public walks and pleasure grounds.

THE WAR.

LOANS TO LOCAL AUTHORITIES.

Immediately on the outbreak of war the Local Government Board, as is well known, urged upon local authorities the importance of mitigating the results of any dislocation of industry which might occur in the areas under their control by reason of the war by expediting any scheme of work within its powers.

The board itself has taken special steps to expedite the consideration of applications for their sanction to loans. During the period between August 4th and September 21st it has sanctioned loans desired by local authorities in England and Wales (other than Poor-law authorities) to the extent of over £3,500,000, as compared with about £1,928,000 sanctioned during the corresponding period of the year 1913. The increase thus shown exceeds 80 per cent. Included in the sum mentioned were loans to the extent of £332,000 in respect of the cost of schemes prepared by sixty local authorities for the erection of dwelling-houses for the working classes.

Valuable assistance is also being given by the Road Board to the local authorities of areas in which exceptional distress from want of employment exists. Three large schemes for the construction of new roads, including the new Western Approach Road to London, had been arranged with the local authorities before the outbreak of war. These schemes will be put in hand at an early date. In addition the Road Board have arranged to make grants to an aggregate amount of nearly £450,000 towards works of new road construction and road improvement in many parts of the country, which will involve a total expenditure of about £1,000,000.

Of the staff and employees of the Surrey County Council, thirty men joined the colours before the war and 103 have joined since. The Highways and Bridges Committee have been authorised to spend, if found necessary, £1,000 in road widening or other improvements so as to avoid the necessity of paying of labour employed, but at the moment temporarily discontinued owing to delay in the supply of materials.

Although over 19,000 members of the Automobile Association have volunteered their cars and motor cycles for war services, difficulty is still being experienced in keeping pace with the requirements of the authorities and organisations working in various parts of the country. To facilitate the supply and distribution of cars called for, the secretary will be grateful if members will kindly notify which branch of volunteer work they would prefer to undertake, also the time they have available. Communications should be addressed to the Secretary, A.A. and M.U., Fanum House, Whitcomb-street, Coventry-street, London, W.C.

Instances of the patriotism of private firms multiply daily. The latest is that of Messrs. Robert McAlpine & Sons, public works contractors. Dr. Douglas McAlpine is with our Army in France, and Captain Robert McAlpine has offered his services. The firm are paying 5s. per week to the wives of their men called to the colours, with 1s. 6d. per week additional for each child. They also offer a bonus of £3 to every man in their employment who joins the Army within four weeks, and will place these men on their return. They will give the same assistance to dependents of those who now join as they offered to the families of those already serving.

America's First Waterworks.—The first waterworks in America are said to have been constructed in 1754 by Hans Christopher Christiansen to supply the Moravian settlement at Bethelehem, Penn. The waterworks included a pump of lignum-vitæ, of 5-in. bore.

Ironite is being used on the following jobs: Mount Vernon Hospital, Northwood; new reservoir for the Metropolitan Water Board at Shooter's-hill, Eltham; Bank of British West Africa, Limited, Liverpool; York Waterworks, Lendal Bridge, York; Stockport Corporation Waterworks; Great Grimsby Waterworks; heating chamber and subway, Lord's Cricket Ground; cattle pens, Bordesley Station, Birmingham; Union Bank of Manchester, York-street, Manchester.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings—Bath £86,000, Deptford £6,500, Folkestone £20,000, housing and town planning—Tynemouth; roads and materials—Dartford, Deptford, Nottingham £8,000, Worcestershire £2,167, sewerage and sewage disposal—Croydon, Marlow, water, gas and electricity—Berwick £70,000, Lewes £5,400. Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Bath T.C.—It is proposed to carry out an extension scheme at the bathing establishment, at an estimated cost of £86,000.

Blackpool T.C.—The borough surveyor, Mr. J. S. Brodie, has prepared plans for baths, laundry, and wash-houses on a site at the corner of Central-drive and Bloomfield-road, at an estimated cost of £30,000. The Baths Sub-Committee have, however, postponed the consideration of the project in order that the borough surveyor might prepare a plan and estimate for a smaller bath minus the laundry and wash-houses.

Deptford B.C.—It is proposed to erect public baths and washhouses in the North Ward district, at a cost of £6,500.

Devon C.C.—It has been agreed to reconstruct the bridge on Exeter-Barnstaple road, near Umberleigh Bridge, at an estimated cost of £1,532.

Fleetwood U.D.C.—In connection with the proposed foreshore improvements at Fleetwood the surveyor, Mr. E. Frobisher, has submitted plans showing the levels of the foreshore above high-water mark from the pier to Laidley's-walk, and he has been instructed to prepare estimates of the cost of erecting a concrete wall and of piling.

Folkestone T.C.—A scheme has been approved for the erection of a band pavilion, at an estimated cost of £20,000.

Holmfirth U.D.C.—A scheme for the erection of a generating station has received the sanction of the Local Government Board.

Honiton R.D.C.—The council have decided to inform the county council that they are prepared to combine with other districts in the provision of a temporary small-pox hospital.

Ipswich T.C.—It has been decided to build a small-pox hospital at Foxhall Heath, at an estimated cost of £5,110.

Loughborough R.D.C.—The surveyor, Mr. H. J. Morgan, recently submitted plans for a proposed new bridge at the dangerous corner at the entrance to Wymeswold, providing a wider carriageway, and a footpath, which did not exist on the present bridge. The council decided to forward the scheme to the Road Board with a request for a grant towards the cost.

Newbury T.C.—A new roof is to be constructed on the corn exchange, at an estimated cost of £1,000.

Newmill U.D.C.—Messrs. Marriott, Son & Shaw have been authorised to submit to the Local Government Board the details of the proposed new reservoir scheme.

Tamworth T.C.—A decision has been reached to build a chapel at the cemetery, at an estimated cost of £950.

HOUSING AND TOWN PLANNING.

Ardrossan T.C.—The Local Government Board having inquired what action the town council propose to adopt with respect to the scarcity of houses for the working class, the Public Health Committee have been asked to report on the subject.

Dawlish U.D.C.—The council have agreed in principle that housing accommodation is needed in the district.

Irvine T.C.—Plans have been passed for the erection of ten double cottages in a street to be formed to the south-east of Ballot-road; four blocks of dwelling-houses on the south side of Kirk Vennel, and eight blocks of dwelling-houses on the east side of Ayr-road.

Rochdale T.C.—The corporation are recommended by the Health Committee to build a number of workmen's dwellings.

Shoebury U.D.C.—The surveyor, Mr. E. Read, submitted recently a plan for the proposed workmen's dwellings. He said he had considered the different types of cottages being erected in other districts, and had visited those at Chelmsford. That type of cottage would, he thought, be suitable for the district. He estimated the cost at £200 per cottage, inclusive of fencing. The plan was referred to the Buildings Committee for consideration.

Stoke-on-Trent T.C.—A resolution has been passed instructing the Housing Sub-committee to prepare a scheme for the erection of workmen's dwellings in the borough.

Tynemouth T.C.—A scheme has been adopted for the erection of ninety-five workmen's dwellings.

PARKS AND OPEN SPACES.

Rothesay T.C.—The extension of the municipal golf course is under consideration.

REFUSE COLLECTION AND DISPOSAL.

St. Andrews T.C.—The council have given the Patent Lightning Crusher Company, Limited, 14A Rosebery-avenue, Gray's Inn-road, London, an order for a dust manipulator plant for reducing house refuse to manure.

ROADS AND MATERIALS.

Bracebridge U.D.C.—An appeal has been made to the Road Board and the Local Government Board for a grant towards the cost of the proposed Fountain Corner improvement.

Chesterton R.D.C.—Road improvements on an extensive scale are to be carried out under the direction of the Road Board, which will make a grant of 75 per cent of the cost.

Coventry T.C.—The Works Committee recommend the construction of a new street across Gosford Green, at an estimated cost of £1,900.

Dartford R.D.C.—The question of participating in the cost of constructing a new lower road from Dartford to Erith has been referred to the Highways Committee. At the last meeting Councillor Vinson stated that the proposed road would be 2 miles and 20 yds. long, and its construction would cost £19,232, towards which the Road Board and the Kent County Council would advance £12,482. The Erith and Dartford Urban District Councils were quite prepared to contribute their proportion of the remaining £6,750. The owners were giving the land, and would construct footpaths 8 ft. wide on each side of the road, which would be 40 ft. in width. The county council would take over the road and maintain it when completed. It was their wish that the work should be put in hand as quickly as possible.

Deptford B.C.—The General Purposes Committee have been authorised to carry out the repaving of New Cross-road with wood, and to make application to the Road Board for a loan, free of interest, to meet the cost of the work.—It has been agreed to repair a number of roads at an estimated cost of £6,000.

Enfield U.D.C.—The surveyor, Mr. R. Collins, has received instructions to prepare plans for making up two streets.

Falkirk T.C.—An estimate of £400 has been passed for works of road repair.

Forfarshire C.C.—It has been agreed to reopen Shielhill Quarry in connection with the reconstruction of the Lumley Den-road. The quarry was closed down eighteen years ago when it was found that the stone was not satisfactory. The committee thought, however, that the stone might be given another trial. It was explained that there would be a considerable saving by taking the stone from Shielhill rather than from Craigie Quarry. The cost per ton worked out at 5s. as against 8s. 8d. from Craigie.

Grays U.D.C.—The Road Board have sanctioned a scheme for the improvement of Stifford-road at an estimated cost of £5,800.

Inverness-shire C.C.—Schemes are under consideration for the improvement of Loch Ness-side Beauly and Glenelg roads at an estimated cost of £4,500.

Linlithgowshire C.C.—The road surveyor to the Bathgate District Committee, Mr. T. Y. Ramsay, reports that, to date, large grants have been received from the Road Board in aid of the improvement of the sections on the Bo'ness-road and on the Bathgate-Airdrie road.

Manchester T.C.—The plans for the new road which is proposed to be made from Stockport to Cheadle have been approved by the Improvements Committee, and the work will now be proceeded with as early as possible. The Road Board has already sanctioned the scheme, and the local plans have been submitted to that body. The road when completed will be one of the finest in the district. It will be 5 miles long and 80 ft. wide, including footpaths 15½ ft. wide. In the centre of the road will be a long stretch of greensward, which may in the future be converted into a tramway, while between the roadway and the asphalted footpath there will be a gravel path along which trees will be planted. The estimated cost of the proposed road is £198,728, towards which the Road Board has made a grant of £60,000.

Middlesbrough T.C.—The borough surveyor, Mr. S. E. Burgess, has prepared plans for widening Marton-road and Acklam-road, at an estimated cost of £30,000.

Nottingham T.C.—The question is being considered of carrying out various repairs to footpaths and carriageways at an estimated cost of £8,000.

Romford R.D.C.—Alternative schemes for the widening of Station-road, which have been prepared by the surveyor, Mr. G. Lapwood, have been forwarded to the county council.

Romford U.D.C. It has been agreed to proceed with private street works in the parish of Dagenham, at an estimated cost of £2,095.

St. Austell R.D.C.—Conditional upon the owners contributing half of the cost, it has been agreed to construct a new road on the Poltair estate, at an estimated cost of £603.

Sunbury U.D.C.—The council have accepted the tender of Messrs. Langley & Johnson, of Slough, at £12,089, for road widening work at Charlton, subject to the approval of the Metropolitan Water Board. The surveyor (Mr. H. F. Coales) stated that the firm had given him an assurance that they would be prepared to carry out the work with local labour, as far as possible, after appointing their own foreman and a few of the principal men.

Worcestershire C.C.—As a result of an interview which the county surveyor, Mr. C. F. Gettings, had with them on the subject of special additional road improvement works, the Road Board have intimated that they would be prepared provisionally to approve the proposals submitted for suggested work to be carried out in case it should be necessary, in view of the state of employment, to initiate additional road improvement works in the county. The estimated cost of the suggested work is £29,457, and the terms are stated to be far more favourable than those usually granted.

SEWERAGE AND SEWAGE DISPOSAL.

Aberdeen T.C.—Sewer extensions are to be carried out at a cost of £125.

Ashton-under-Lyne T.C.—The tender of Ames-Crosta Sanitary Engineering Company, Limited, of Nottingham, has been recommended for acceptance for two of their patent "Simplex" rectangular travelling distributors.

Bath R.D.C.—The Local Government Board have approved the plans of the Freshford sewage disposal scheme as generally satisfactory, but suggest various minor amendments, which will be duly carried out.

Brighouse T.C.—The tender of Ames-Crosta Sanitary Engineering Company, Limited, of Nottingham, has been accepted for their well-known "Simplex" rotary sprinklers.

Croydon R.D.C.—The advice of an expert is to be obtained on the scheme for the proposed reconstruction of the sewage works prepared by the surveyor, Mr. R. M. Chart.

Disley R.D.C.—The amended plans of the Newtown sewerage scheme, as suggested by the Local Government Board, have been passed, and application is to be made for authority to borrow £302 to cover the cost.

Mansfield T.C.—The council are giving consideration to a report by Mr. J. D. Watson on certain suggested improvements at the sewage disposal works.

Oswestry R.D.C.—The council have instructed Messrs. Berrington, Son & Watney, of Wolverhampton and Westminster, to prepare a scheme of sewerage for St. Martins.

Romford U.D.C.—Sewerage works estimated to cost £470 are to be carried out in the parish of Dagenham.

Rotherham T.C.—A further repeat order has been placed for patent "Simplex" rotary sprinklers with Ames-Crosta Sanitary Engineering Company, Limited, of Nottingham.

Sedgefield R.D.C.—The surveyor, Mr. J. Stones, has submitted alternative schemes for the extension of the sewage works, one consisting of the addition of 2 acres of land, and the other of filter-beds. The matter has been sent to the local committee.

Tendring R.D.C.—The council have instructed Messrs. Taylor & Wallin, civil engineers, of Newcastle-on-Tyne and London, to report upon the drainage of the parish of Thorpe-le-Soken.

Wolverhampton T.C.—It has been resolved to instal electrical plant at the sewage disposal works at an estimated cost of £780.

WATER, GAS, AND ELECTRICITY.

Anstruther T.C.—Under pressure from the Local Government Board, who wrote that they could not permit the question of the removal of the sources of pollution of the water supply to be indefinitely delayed, the council have agreed to hold a conference with the Pittenweem Town Council, with a view to settling the water supply problem.

Berwick T.C.—When the trials at the new borehole in Tweedmouth yielded such unsatisfactory results, it was decided to call in the services of outside engineers, with a view to finding an augmentation of the present water supply. Messrs. Leslie & Reid, Edinburgh, to whom the commission was given, have now presented their report, which has been printed and circulated among the members of the committee. The schemes proposed by the engineers are all gravitation supplies. One is to bring the water from one of the burns in the Wooler district; and the one which is most favoured by the engineers is to bring the water by gravitation from the Lammermoor district, a distance of about 26 miles. This, it is estimated, will cost something like £70,000.

Chertsey R.D.C.—The tender of Messrs. Hardy & Co., of Woking, at £1,780, has been accepted for the surface-water scheme for Byfleet Village.

Chippenham T.C.—A filtration system for the improvement of the water supply is to be provided at a cost of £1,500.

Cowes U.D.C.—The pumping machinery at the waterworks is to be duplicated, and a new main laid, at an estimated cost of £5,000.

Dungannon U.D.C.—The council have sanctioned an application by the Joint Committee of the urban and rural district councils for a Provisional Order for the acquisition of a number of springs in the water catchment area at Altmore. The council's engineer estimated the cost of the scheme at £2,000.

Hampton U.D.C.—The council having entered into a contract with the Hampton Court Gas Company for the automatic lighting of the public street lamps in East and West Molesey, a commencement of the installation was made on Friday. There are upwards of 200 lamps in the district, and the system to be adopted is the "Gunfire," the clockwork arrangement of which will be set weekly according to a time schedule.

Ipswich T.C.—The work of laying the Shotley water main for the purpose of supplying the Naval Barracks with Ipswich water has been completed by the contractor, Mr. J. Moran, well under the contract time. The pipes covered a distance of 10 miles. The undertaking was carried out under the supervision of the Ipswich waterworks engineer, Mr. C. W. S. Oldham.

Larne R.D.C.—It has been decided to proceed with a water supply scheme for the parish of Woodburn.

Newton Abbot U.D.C.—Ilsington and Liverton are

to be provided with water supplies, at an estimated cost of £3,208, the works including the construction of a reservoir.

Norman Cross R.D.C.—The Local Government Board having written advising the council to obtain a water supply for Orton Waterville from the Peterborough water mains, the council discussed the subject, and eventually instructed the surveyor, Mr. H. Hawkins, to invite tenders for boring still further an existing well, in which there is stated to be always plenty of water.

Plymouth T.C.—The report of the water undertaking for 1913-14 shows a nett profit of £8,351, an increase of £948 upon the preceding year.

Stoke-on-Trent T.C.—The total revenue from the electricity undertaking was reported to be £52,560, and the gross profit £16,629, but after paying sinking fund charges there was a nett loss of £5,139, to which was added £1,023 on account of capital expenditure paid out of revenue. The loss was chiefly accounted for by extraordinary repairs to plant, increase in rate assessment, and the higher cost of fuel.

Wem R.D.C.—Instructions have been given for the preparation of a report upon a water supply scheme for Prees.

MISCELLANEOUS.

Hull T.C.—Mr. Christopher Pickering, of Hornsea, has given 11¼ acres of land at Pickering Park for the purpose of a boating lake. His object is to provide work for the unemployed, and it is estimated that in the construction of the lake 93 per cent of the wages will be expended upon unemployed workmen, and the greater part of the remaining 7 per cent will be distributed among the workmen affected by the war. The minimum value of the land is £300 per acre. The scheme, towards which the Local Government Board will contribute £3,000, will give employment to 200 men for seven months.

Stepney B.C.—In reference to the London County Council's proposal to reconstruct the trackwork of the old horse tramway in Burdett-road and Grove-road, the Works Committee report that there is reason to apprehend that the London County Council have in view the installation of the overhead system of traction. The borough council having held that the only system suitable for the roads in question is the underground conduit system, the committee will recommend that a communication be addressed to the London County Council in opposition to the suggested reconstruction under the circumstances.

Stoke-on-Trent T.C.—It has been decided to proceed with public works to the amount of £15,000 to relieve unemployment in the six Potteries towns. Of this amount £12,000 will be spent in labour alone.

PERSONAL.

Mr. David Edwards, of Burry Port, has been appointed borough surveyor and inspector of Kidwelly.

Mr. J. Dunn, assistant surveyor to the Alfreton Urban District Council, has been appointed assistant surveyor to the Maidenhead Town Council.

Mr. W. Langford, engineer at the Longton gasworks, has been appointed chief engineer and manager of the gas undertakings of the Corporation of Stoke-on-Trent, at a salary of £600 rising to £700.

Mr. Frank J. Harris, surveyor to the Holsworthy Rural District Council, has been appointed assistant surveyor to the Devon County Council, under Mr. R. M. Stone, county surveyor for No. 1 Division, at a salary of £150, rising to £200, and an allowance of £40 per annum for a motor cycle.

Mr. F. A. Furber, surveyor to the Quarry Bank (Staffs) Urban District Council, has for many years been a lecturer in sanitary science at the Birmingham Technical Institute. As a result of his teaching last year the whole of his pupils succeeded in passing the examination, and 85 per cent of them first-class. Mr. Furber has been offered and has accepted two additional certificates.

Mr. Herbert Chatley, M.Inst.C.E.I., Professor of Civil Engineering at the Chinese Government Engineering College, North China, formerly of the borough engineer's department, Fulham, and of the Municipal Technical College, Portsmouth, has received the degree of Doctor of Science (Engineering) from the University of London. His thesis deals with the subjects of convex contact and rolling resistance, and will probably be published in the *Journal* of the Institution of Municipal and County Engineers. Numerous papers and books on engineering subjects which he has published were presented in support of his candidature.

Mr. Charles H. Waithman, the engineer and surveyor to the Cleethorpes Urban District Council, a portrait of whom is given on another page of this issue, was educated at Cranleigh and Hutton Grammar School. He received his training in the offices of the Teignmouth Urban District Council, and has since held appointments under the urban councils of Kingswood (Bristol), Lynton, Leighton Buzzard, and Newmarket. During the period covered by these appointments he has designed and carried out many important improvement schemes. Noteworthy among these was a main road steel girder bridge and road widening, and the reconstruction of the sewerage outfall works at Leighton Buzzard; also the reconstruction of the sewerage outfall works, and a new technical school at Newmarket, for which latter work he was architect. Mr. Waithman has taken a particular interest in the modern methods of road making, and has carried out many miles of reconstruction work on various systems, including a resurfacing scheme at Newmarket, for which a loan of £5,000 was granted. He is the patentee of the "Waithman" reservoir tar broom, which is used so extensively by county and municipal authorities, both throughout this country and abroad. In addition to the municipal works mentioned in his paper at the recent meeting of the Institution of Municipal and County Engineers at Cleethorpes, he is now engaged upon a scheme for the reconstruction of a marine lake, open-air bathing place, and promenade extension. He is an associate member of the Institution of Civil Engineers, and holds the diploma and is a member of the Municipal and County Engineers. He also holds the diploma of the Royal Sanitary Institute.

SOME RECENT PUBLICATIONS.*

The Public Health Acts, annotated, with appendices containing the various incorporated Statutes and Orders of the Local Government Board, &c. First Edition, Public Health Act, 1875, by W. G. Lumley, LL.M., Q.C., Counsel to the Local Government Board, and Edmund Lumley, B.A., of the Middle Temple, Barrister-at-Law. Eighth Edition. In two volumes. By Alexander Macmorran, M.A., one of His Majesty's Counsel, and Joshua Scholefield, of the Middle Temple and North-Eastern Circuit, Barrister-at-Law, assisted by Gerard R. Hill, M.A., of the Inner Temple and North-Eastern Circuit, Barrister-at-Law, and Kenneth M. Macmorran, M.A., LL.B., of the Middle Temple and Western Circuit, Barrister-at-Law. Price £3 15s. net. London: Butterworth & Co., and Shaw & Sons.

It is six years since the last edition of this valuable standard work was published. During that period some twenty Acts of Parliament relating wholly or partially to matters within the scope of the work have been passed. To mention only one or two of the more important, there are the Housing and Town Planning Act, 1909, the Development and Roads Improvement Funds Act, 1910, the National Insurance Act, 1911, and the Shops Act, 1912. Moreover, some of these Acts delegate what are practically legislative powers to Government Departments; so that, as camp followers trail behind an army, a horde of rules, regulations, orders and departmental circulars have followed in the wake of these statutes. And, again, as probably no Act of Parliament ever was, or ever will be, passed without sooner or later presenting conundrums and enigmas for the solution of His Majesty's judges, not a year passes without its crop of judicial decisions on points of public health and local government law, amounting on an average (according to the learned editors of these volumes) to not far short of 100 per annum. It is not surprising, therefore, to learn from the preface that the most difficult problem which the editors had to face in preparing the present edition was that of space. The last edition extended to two decidedly bulky volumes, and how was so much new matter to be

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

[illegible] By a process of elimination of [illegible] and [illegible] has been attained. Provisions [illegible] are [illegible] to Scotland and Ireland [illegible] are [illegible] in constituting existing [illegible] and a few explanatory sections have been inserted. Acts of Parliament are referred to in the text by their short titles only (the regnal years and chapters being given in the Table of Statutes), and references to cases are restricted to two sets of reports (other references appearing in the Table of Cases).

By the use of these expedients the two new volumes bulk little more than their predecessors, notwithstanding the very considerable enlargement of their contents. Special attention has been devoted to the housing and town planning provisions, which have been so to the fore since the passing of the Act of 1909, and to the revision of the notes dealing with the practice of the Local Government Board—by no means one of the least useful features of the work to the practical official. The case law has been brought right up to date, and includes the recent very important decision of the House of Lords, under the Settlement Act, in *Local Government Board v. Arlidge*. The new edition, in short, fully maintains the high reputation of those which have preceded it, as a thoroughly reliable and self-contained text-book on all that is included in the comprehensive expression "The Law of Public Health," and the powers and duties of district councils.

FOR OTHER ADVERTISEMENTS

See End of Paper.

EASTERN VALLEYS (MONMOUTHSHIRE) JOINT SEWERAGE BOARD.

APPOINTMENT OF ENGINEER.

The above-mentioned Board invite applications for the position of Engineer to the Board, to advise the Board as to the preparation of a Sewerage Scheme, &c.

Applications, stating qualifications and terms required, to be sent to me on or before the 9th prox.

W. H. V. BYTHWAY,
Clerk to the Board.

Pontypool.
September 30, 1914. (1,972)

HOLSWORTHY RURAL DISTRICT COUNCIL.

APPOINTMENT OF SURVEYOR OF HIGHWAYS.

The above Rural District Council are prepared to receive applications for the appointment of Surveyor of Highways.

The district comprises 21 parishes with about 40 miles of main roads and 233 miles of district roads.

The salary will be £130 per annum, rising by annual increments of £5, on satisfactory service, to a maximum of £150, to include all out-of-pocket expenses except stationery and postages.

The person appointed must have a good practical knowledge of road making, and be competent to properly supervise the working of the steam roller and the roadmen in the Council's employ.

He will be required to devote the whole of his time to the duties of the office, to keep the necessary books and accounts applicable thereto, reside at such place as shall be approved by the Council, and to provide his own means of locomotion.

Approved security in the sum of £100 will be required, and the appointment will be subject to the approval of the County Councils of Devon and Cornwall, and be terminable by three months' notice on either side.

Applications, in candidate's own handwriting, stating age (which must be between 25 and 45 years) and present and previous occupations, accompanied by copies of not more than three testimonials of recent date, to be sent to me on or before Tuesday, the 13th day of October next, endorsed "Surveyor of Highways."

Canvassing the Councillors is strictly prohibited, and will be deemed a disqualification.

(By order)
CLAUDE KINSMAN,
Clerk to the Council.

8 North-road,
Holsworthy.
September 30, 1914. (1,971)

CITY AND COUNTY OF THE CITY OF EXETER.

ARCHITECTURAL ASSISTANT.

Required, in the City Surveyor's Office, a temporary Architectural Assistant.

Candidates must be experienced in the preparation of Contract Drawings and Quantities.

Salary, £2 2s. per week.

Applications, stating age, experience, past and present employment, and accompanied by copies of not more than three testimonials, to be sent to me not later than 13th October, 1914, endorsed "Architectural Assistant."

THOS. MOULDING, M.INST.C.E.,
City Engineer and Surveyor.

Municipal Offices,
Exeter.
September 29, 1914. (1,973)

SECOND CLASS OVERSEER required for the Public Works Department, Hong Kong, for three years, with possible extension. Age 23-30; unmarried. Salary £200, rising by £10 every two years to £230. Free unfurnished quarters and passages. Candidates should be experienced in construction and maintenance of macadamised roads, tar-macadamised roads, tar-painted roads, compressed asphalted roads, and paved footways, and in working a stone quarry with stone-crushing plant, capable of measuring up and preparing statements of work done. Candidates with the above experience should apply at once, by letter, to the Crown Agents for the Colonies, 4 Whitehall-gardens, London, S.W. (1,977)

BOROUGH OF HAMMERSMITH.

TO PAVING CONTRACTORS AND OTHERS.

The Council invites Tenders for Paving the Carriageway of Dalling-road (between Paddenswick-road and Brackenbury-road; approximate area, 5,200 super. yds.) with 4½-in. Creosoted Deal Blocks upon 8-in. Concrete Foundations, in accordance with Specifications which, with Forms of Tender, may be obtained on application to Mr. H. Mair, M.INST.C.E., Borough Surveyor.

Sealed Tenders, endorsed "Tender for Wood Paving Works, Dalling-road," must be delivered to me not later than 4 p.m. on Wednesday, the 14th October, 1914.

The Council does not bind itself to accept the lowest or any Tender.

LESLIE GORDON,
Town Clerk.

Town Hall, Hammersmith, W.
September 29, 1914. (1,976)

BOROUGH OF KINGSTON-UPON-THAMES.

The Corporation invite Tenders, not later than the 14th October, 1914, for about 6,000 yds. of Press Cloth for their Sewage Works, according to the Specification to be obtained of the Borough Surveyor.

HAROLD A. WINSER,
Town Clerk.

Municipal Offices,
Kingston-upon-Thames.
September 29, 1914. (1,975)

BOROUGH OF KINGSTON-UPON-THAMES.

SULPHURIC ACID.

The Corporation invite Tenders for the supply, during the ensuing twelve months of about 300 tons of 80 per cent Sulphuric Acid for their Sewage Works.

Further particulars and Forms of Tender may be obtained of the Borough Surveyor, Mr. R. Hampton Ciucas, at the Municipal Offices.

Sealed Tenders, endorsed "Sulphuric Acid," to be delivered at this office not later than Wednesday, the 14th October, 1914.

The lowest or any Tender will not necessarily be accepted.

HAROLD A. WINSER,
Town Clerk.

Municipal Offices,
Kingston-upon-Thames.
September 29, 1914. (1,974)

ACTIVE AND CAPABLE CITY GENTLEMAN, having had to give up business owing to the war, is anxious to find employment in any capacity which may enable him to support his wife and family. References, the Editor of THE SURVEYOR.—BOX 1,472 office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,970)

Institution of Municipal and County Engineers.

THE CLEETHORPES MEETING.

(*Conclusion.*)

Presidential address [illegible] that a portion of [illegible] the proceedings at the present meeting of the Institution of Municipal and County Engineers at Cleethorpes. The opening speeches are given herewith.

Mr. A. E. Collins (Newport) said he did not know whether it was in connection with the proposed modification of the building bye-laws in Cleethorpes that discussion had taken place as to what the height of rooms should be. They were [illegible] to get [illegible] at the

Alderman Wm. Grant, J.P., C.C.,
Chairman, Cleethorpes Urban District Council.

[illegible] and it had been suggested that the bye-laws in force required too great a height. It was not necessary, so far as health was concerned, to have rooms of greater height than 7 ft. if proper means of ventilation were provided. The difference of cost between rooms of 7 ft. and 9 ft. in height was pretty considerable. As to [illegible], these were, of course, essential, but the question was, what materials should be allowed. Builders put in felt and so-called bituminous materials, but tests would show that they were quite useless for the purpose they were intended to serve. It was a question to be settled as to what should be allowed. At present they had to lead a man before a magistrate in order to prevent the use of what they considered to be objectionable materials. Then as to the matter of bye-laws for different classes of buildings, there were, doubtless, in Cleethorpes certain areas where they would like to allow a cheap class of building, for instance where it was far enough from the sea for the land not to be of great value. He thought they should be in a position to permit the erection of a cheaper class of building in certain situations, and that the by-laws should be governed by the amount of open spaces round the buildings. As to rounded corners, he quite agreed as to the rounding of boundary fences, but disagreed as regarded the kerbs. Kerbs kept out to the ordinary radius prevented reckless driving, and he thought they ought to be very careful indeed in rounding-off corners to large radii at the kerb lines. Mr. Alford, in speaking of the motive power adopted for the pumping of sewage, had said that, for reasons which would probably not be questioned, it was considered town's gas engines were the best to adopt; but perhaps he would say why he had so chosen. It would be interesting to know the governing consideration in that connection, and, perhaps, in dealing with the point, he would tell them the average dry-weather flow and the maximum for storm water. Mr. Alford gave what he considered the proper times for the discharge of the sewage; that was not in accordance with the usual practice, and he would like to know what were the special conditions in the mouth of the Humber which made it advisable there. He fancied Mr. Whyatt had not grasped Mr. Alford's meaning as to the matter of tendering. It was a very awkward position to be put in to be obliged to accept the lowest tender, and that, he understood, was Mr. Alford's complaint.

Mr. E. J. Silcock (Westminster and Leeds) said he quite agreed with the remark made by Mr. Whyatt that it was not quite in good taste to refer to the Grimsby sewage outfall. He had had occasion to examine this professionally, and knew something about it, and he did not think it was a remark quite called for. He was very pleased indeed to see that the county council were wise enough to have a scheme prepared by so competent a man as Mr. Alford, and that they had carried out this scheme on the best lines for the town. He knew something of the scheme

Mr. Chas. H. Waithman, Assoc.M.Inst.C.E.,
Engineer and Surveyor, Cleethorpes.

which was previously considered, and there were grave defects in that scheme which would have made themselves felt as the town grew in importance. It might have done for the time being, but as the town grew it would have become apparent. Mr. Alford had adopted a combination of machinery which appeared to be a very good one—reciprocating pumps for the dry-weather flow and centrifugal pumps for storm water. One of the difficulties was to provide elasticity in the pumping arrangements for the difference in the volume of sewage to be dealt with. He did refer to this matter indirectly in the meeting at Cheltenham, and he was rather criticised for saying that the pumping machinery ought all to be duplicated. He noticed here that Mr. Alford had got duplicates, but it only provided for the dry-weather flow. He had got three storm-water units; they were not working constantly or very often, and consequently if one got out of order there was more chance of putting it right again than with the ordinary flow. With regard to the tank, the cost of massed concrete worked out at more than the reinforced concrete. His experience was that for covered tanks the cost of massed concrete and reinforced concrete was, approximately, the same. There was not very much saving to be effected by the adoption of reinforced concrete. He appreciated that the foundations were bad, and the total amount of weight might have had an important bearing on the decision as to the size and strength of the

"The Municipal Works of Cleethorpes," by Mr. C. H. Waithman, Assoc.M.Inst.C.E., the engineer and surveyor, and "The Cleethorpes New Sewerage Scheme and Outfall Works," by Mr. John S. Alford, M.Inst.C.E.

meetings. That might have caused the unusual condition of things to be the same weeks, but with the exception of the [illegible] of the unusual circumstances that [illegible] the meetings would be held. The Chairman of the Authority had [illegible] rather a pity that [illegible] would be held in future [illegible] it was in a measure [illegible] the usual [illegible] By the way [illegible] a bill [illegible] Mr. [illegible] [illegible] the [illegible] [illegible] [illegible]

for some years past, and the surfaces of the roads were such that a large quantity of tar was not required. The tar was not distilled, but it was of very excellent quality. Scavenging was, of course, augmented in the season, but not to the extent one might think, their method is being consistently good throughout the year. They had various places for tipping the handcarts, and they sent round each day and collected the material. As regarded the dampness of the tar, he was not quite so positive as to the course to be pursued, in some cases they had found it was useless. The matter of temporary buildings was one that engaged the attention of the council for a considerable time, and he was sure all the members would admit that that class of building was a very great eyesore, and one that in time became a nuisance. Their practice was to license them at a charge of 1s. per annum. They were placed under temporary agreements, all falling due on June 30th, and being renewable each year. As to the room in the roof, he thought Mr. Collins had a tendency to lean somewhat towards the builder, and he could not agree with him. The Model By-laws which were enforced under the Act of 1875 gave one that distinction as to the height of the attic room in the roof. He could say without hesitation that the conveniences paid very well; last year the proceeds were just over £200. The electricity undertaking in the North Ward had not yet been able to show a profit. The price of 2s. 8d. per yard super. for tarmacadam was in reference to a particular street carried out in dry granite with bituminous binder, and afterwards painted. The cost was a little more, but there was some difficulty in obtaining delivery of material. Their usual work was 4 in. of tar-macadam. They paid 14s. 5d. and 15s. 4d., and, including subsequent tar-painting, they could not do it much cheaper. In regard to the specification for private street works, they had had no occasion to go before the magistrates. As to the corners, he was entirely in accord with his council on the point. With reference to compensation, in many cases they had the land given, but in other cases they purchased at the rate of the ground rent at 3d. per yard for thirty years. The site of the destructor was put forward some two years ago by himself, and no objection was raised to it, although the Local Government Board inspector, Mr. Hooper, referred to its close proximity to dwelling-houses. The inquiry, however, resulted in a considerable increase of the height of the shaft.

Mr. ALFORD, in reply, said he was particularly glad to hear Mr. Whyatt say that he agreed with him as to the times of discharge. Mr. Whyatt knew the foreshore, and his opinion was valuable. In arriving at the time of discharge they did it after considerable experiment. Regarding the criticism of the statement in his paper that "the Grimsby sewage outfall, which is near high-water mark, is a source of pollution to the shores of both Grimsby and Cleethorpes," he should not have thought there was any doubt about it at all. It was a plain statement of fact of which he knew to his own knowledge. The Grimsby outfalls discharged at a point where they polluted the foreshore of both towns. The Cleethorpes outfall discharged lower down, and no doubt some of the matter went on the Grimsby shore. But the plain fact was this: that both authorities were polluting the other's foreshore. Cleethorpes had put their house in order, and they were hoping that Grimsby would put theirs in order too. He need hardly remind engineers that any money which Cleethorpes spent to purify its sewage would not be effective of its full value until the complementary part was done at Grimsby, and they felt that Grimsby would show, when this new dock was constructed and the outfall was removed, that that source of pollution was also removed. Mr. Collins asked him to say what decided them in the choice of power for the pumping station. They took town gas because it was cheap, and secondly because the stand-by power was always ready. They had a cheap town gas in Cleethorpes, and it was a power they could call upon at any time when they wanted it. That was the guiding principle. He was afraid he could not say more than this: they did not know what the dry-weather flow was going to be. The dry-weather flow was expected to be 30 gallons per head, while the pumping power was 400 gallons per head per day. With regard to the discharge of sewage, he could not say that he disagreed with what had been said as to that, but criticised the suggestion that had been made that a certain thing was usual in discharging into the sea. Every case required special investigation. Mr. Silcock had spoken as to the flexibility of the plant, and he agreed as to the necessity of that. As to whether the filtration of air was effective, the air filter for the tank it was proposed to put down was largely based on the work at Hampton, where the whole of the air was passed out through an air filter. He could not say what length of sewer was laid on piles. As to Mr. Pickering's remarks upon the subject of rainfall, he did not attach much importance to the stereotyped methods of calculating the volume of storm water: he preferred to go to the town and study the conditions before deciding.

An Appointment Wanted.—We have heard, with regret, of an exceedingly hard case arising out of the war crisis. A gentleman had, after some years of unremitting industry, built up in London a business which provided his sole income. It depended on Continental connection, and the war has put an instant and effective end to it. We appeal to our readers for assistance in the form of work. Anything that would enable him to support his wife and family would be welcomed. He is in the prime of life, active and industrious, a linguist, an excellent correspondent, and a capable organiser. We can testify personally to his high character and general culture.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. S. PICKERING, M.INST.C.E., Borough Surveyor and Water Engineer, Cheltenham.

HINCKLEY MEETING.

An East Midland District meeting is to be held at the council offices, Hinckley, to-morrow (Saturday).

PROGRAMME.

10.45 a.m.—The district committee to meet at the council offices, Hinckley, to discuss general district business.

11.15 a.m.—The members and visitors will be received by the chairman (Mr. G. Kinton, J.P.), and members of the Hinckley Urban District Council.

11.30 a.m.—Discussions on the following papers: "Eleven Years' Municipal Work at Hinckley," by Mr. E. H. Crump, ASSOC.M.INST.C.E., F.S.I., engineer and surveyor to the Hinckley Urban District Council; and "By-laws and the Housing Question," by Mr. W. H. Court, ASSOC.M.INST.C.E., borough engineer's department, Leicester.

12.45 p.m.—Inspection of the public baths adjoining the council offices.

1 p.m.—Luncheon at the Union Hotel, at the kind invitation of the chairman and members of the Hinckley Urban District Council.

2.15 p.m.—Proceed in motor conveyances (at a charge of 3s. per person) to inspect the workmen's dwellings erected and in course of erection in Rugby-road, &c., and thence to the Snarestone Waterworks, 14 miles distant, to inspect the pumping station, &c., where tea will be provided by Mr. E. H. Crump.

4.15 p.m.—Leave Snarestone and drive to Gopsall Park, where members will be given the opportunity of inspecting the gardens, by kind permission of Earl Howe.

6 p.m.—Arrive at Hinckley Railway Station.

E. H. CRUMP, A.M.I.C.E., *Hon. District Secretary*, Hinckley.
E. G. MAWBEY, M.INST.C.E., *District Chairman*, Leicester.

J. W. DUDLEY ROBINSON, B.SC.(LOND.), *Secretary*.
92 Victoria-street, Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

Meetings will be held at Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

B. WYAND, *Secretary*.
39 Victoria-street, S.W.

ROYAL SANITARY INSTITUTE.

YORK MEETING.

On Saturday, October 24th, at a meeting of the Royal Sanitary Institute at York, Mr. F. W. Stobie, the city engineer, will read a discussion on "The Municipal Treatment of the York Sewage."

In the afternoon visits will be made to the pumping station at Dalton Holme, the works at Naburn, and the new Dispensary [illegible].

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

INSPECTOR OF NUISANCES.—October 3rd.—For the corporation of Bootle. £80-£120. Dr. John E. Gould, medical officer of health.

INSPECTOR OF NUISANCES.—October 5th.—For the Leake Rural Rural District Council. £60 per annum. Mr. A. W. [illegible], clerk, Union Offices, Loughborough.

BURGH SURVEYOR.—October 5th.—Rutherglen Town Council. £220—£300 per annum. Mr. G. Gray, town clerk.

ARCHITECT.—October 5th.—Aberdare Education Committee.—Mr. T. Botting, director of education, Education Offices.

RESIDENT ENGINEER.—October 8th.—Fareham Rural District Council. 3½ guineas per week. Mr. Alfred Laker, clerk, 97 West-street, Fareham, Hants.

SANITARY INSPECTOR.—October 10th.—Fulham Borough Council. £120 per annum.—Mr. J. P. Shuter, town clerk.

ASSISTANT SURVEYOR (Temporary).—October 10th.—Harrow-on-the-Hill Urban District Council. £2 per week.—Mr. John Strachan, clerk.

TOWN FOREMAN.—October 10th.—Willenhall Urban District Council. 35s. per week.—Mr. T. Edgar Fellows, engineer and surveyor, Town Hall.

ENGINEER AND SURVEYOR.—October 13th.—Portland Urban District Council. £200 per annum. Mr. R. A. Colenutt, clerk, Council Offices, New-road, Portland.

ASSISTANT ENGINEERS.—East Africa Protectorate Public Works Department. £300.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ASSISTANT ENGINEERS.—Government of the Gold Coast, Public Works Department. £350—£400.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

TEMPORARY DRAUGHTSMAN.—Corporation of Southend-on-Sea. — Mr. Ernest J. Elford, borough engineer and surveyor.

ENGINEER AND SURVEYOR'S ASSISTANT.—Friern Barnet Urban District Council.—Mr. E. J. Reynolds, engineer and surveyor, The Priory, Friern Barnet-road, N.

CLERK OF WORKS.—October 8th.—The Valley (Anglesey) Rural District Council. £2 10s. per week. Mr. O. J. Hughes, clerk.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

RATHDRUM.—October 11th.—For a scheme of water supply from Ballinderry Brook, for the Rathdrum Rural District Council. Prize of £50.—Mr. P. W. Sheehan, clerk, Workhouse, Rathdrum.

ST. HELENS.—October 31st.—Drawings of police buildings and fire station, for the St. Helens Corporation. Premiums, £100, £50, and £25.—Mr. A. W. Bradley, borough engineer.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

WEST RIDING.—October 3rd.—For the erection of [illegible] for the Education Committee.—Education Architect, County Hall, Wakefield.

SHEFFIELD.—October 3rd.—For the execution of works in connection with the covering of the river Sheaf [illegible] bridge widening, new weir, new bridge, retaining wall, and new street, for the corporation. City Engineer.

DARTFORD.—October 3rd.—For the extension of the electricity works, for the urban district council.—The Surveyor.

BRADFORD.—October 3rd.—For the erection of a branch library, for the corporation.—City Architect.

BLACKBURN.—October 5th.—For the erection of a dispensary, for the corporation.—Mr. W. Stubbs, borough and water engineer.

EXETER.—October 5th.—For the erection of fourteen blocks of houses and flats, for the corporation. City Surveyor.

HEYWOOD.—October 5th.—For extensions to electricity works, for the corporation.—Mr. J. B. Nuttall, borough surveyor.

DEVIZES.—October 5th.—For the erection of six workmen's dwellings, for the rural district council.—Mr. T. V. Trumper, Ivy House, Devizes.

WEYBRIDGE.—October 5th.—For the supply of granite, broken flints, gravel and screenings, and team labour, for the urban district council.—Mr. J. S. Crawshaw, surveyor.

SHREWSBURY.—October 5th.—For the erection of piggeries and public conveniences, for the corporation.—Mr. A. W. Ward, borough surveyor.

KEIGHLEY.—October 6th.—For foundation and levelling work for new garage, for the corporation.—Mr. H. Webber, borough electrical engineer.

LEEDS.—October 6th.—For additions to sanatoriums and hospital, for the corporation.—Mr. W. T. Lancashire, city engineer.

SWANSEA.—October 6th.—For private street works, for the corporation.—Mr. G. Swarbrick, acting borough surveyor.

TOTTENHAM.—October 6th.—For resurfacing a roadway, for the urban district council.—Mr. W. H. Prescott, engineer.

SEVENOAKS.—October 6th.—For the erection of sixteen cottages, for the urban district council.—Mr. S. Towlson, surveyor.

HUDDERSFIELD.—October 6th.—For the erection of a urinal, for the corporation.—Mr. K. F. Campbell, borough engineer and surveyor.

PONTEFRACT.—October 7th.—For the erection of an ambulance station, for the corporation.—Mr. John E. Pickard, borough surveyor.

GLAMORGAN.—October 7th.—For the erection of new schools and the repair of existing schools, for the county council.—County Hall, Cardiff.

STRATFORD-UPON-AVON.—October 7th.—For the erection of thirty-six workmen's cottages, for the corporation.—Mr. R. Dixon, borough surveyor.

SHEFFIELD.—October 7th.—For hospital extension, for the corporation.—City Architect, Town Hall.

COLWYN BAY.—October 8th.—For the erection of a refuse destructor, with steam boiler and auxiliary machinery complete, for the urban district council.—Mr. E. M. Lacey, consulting engineer, 12 Victoria-street, Westminster, S.W.

WARRINGTON.—October 9th.—For the erection of a school, for the Education Committee.—Mr. J. M. Murray, secretary, Education Office.

HINCKLEY.—October 10th.—For laying about 4 miles of water mains, erection of a workshop, and approach road, and the provision and fixing of wrought-iron fencing, for the rural district council.—Mr. E. H. Crump, engineer, Hinckley.

LANCASHIRE.—October 10th.—For the erection of a police station, for the Standing Joint Committee.—Mr. H. Littler, county architect, 16 Ribblesdale-place, Preston.

MANCHESTER.—October 10th.—For the erection of a school, for the corporation.—Education Offices.

CORNWALL.—October 10th.—For the erection of a new school and additions to existing school, for the Education Committee.—Mr. S. Hill, architect, Greenlane, Redruth.

WALLASEY.—October 13th.—For the erection of tramway workshops, for the corporation.—Borough Engineer and Surveyor.

WEST SUSSEX.—October 13th.—For the erection of new schools and alterations to existing schools, for the Education Committee.—Mr. H. P. Roberts, county education architect, Thurloe House, High-street, Worthing.

COLWYN BAY.—October 15th.—For the erection of an electric power station, for the urban district council.—Mr. E. M. Lacey, 12 Victoria-street, Westminster.

LEICESTER.—October 17th.—For the supply and erection of steel plate girders and steel troughing, and the widening of Bow Bridge over the river Soar, for the corporation.—Borough Surveyor.

COSFORD.—October 17th.—For the construction of a brick tower, laying water mains, standpipes, valves, and other works, for the rural district council.—Mr. C. Dudley Bright, Polstead Heath, Polstead, Suffolk.

GODSTONE.—October 17th.—For the erection of ten working-class dwellings, for the rural district council.—Mr. T. C. Barralet, surveyor.

LONDON.—October 20th.—For the extension of engine-house, boiler-house, coal store, and other works, for the county council.—Chief Engineer.

MANCHESTER.—October 21st.—For the restoration of the embankments of the Audenshaw reservoirs, for the corporation.—Messrs. G. H. Hill & Sons, Albert Chambers, Albert-square, Manchester.

IPSWICH.—October 22nd.—For the erection of public health offices, for the corporation.—Mr. J. R. Mead, borough engineer and surveyor.

WEST HAM.—October 27th.—For the extension of the asylum, Goodmayes, Essex, for the corporation.—Borough Engineer, Town Hall.

BOMBAY.—January 7th.—For the complete manufacture, erection and equipment of a refuse destructor for the incineration of 200 tons of refuse per day, for the municipality.—Mr. P. R. Cadell, municipal commissioner, Municipal Offices, Bombay, India.

Iron and Steel.

BRADFORD.—October 7th.—For the duplication of seven pipe syphons, the supply of 7,500 tons of cast-iron pipes, and the supply of 900 tons of mild-steel pipes, for the corporation.—Mr. J. Watson, waterworks engineer, Town Hall.

SOUTHEND-ON-SEA.—October 8th.—For the supply of approximately 200 tons of 8-in. diameter cast-iron spigot and socket pipes, for the corporation.—Mr. Ernest J. Elford, borough engineer.

GRAYS THURROCK.—October 8th.—For the supply of 680 lin. yds. of wire fencing, with wrought-iron standards, and four wrought-iron field gates, for the urban district council.—Mr. A. C. James, surveyor.

Roads.

KIRKCALDY.—October 3rd.—For laying a road with granite setts, for the corporation.—Burgh Surveyor.

TANGIER.—October 3rd.—For road construction, for the Moroccan Adjudications Commission.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

BATTERSEA.—October 5th.—For the supply of materials and works for resurfacing roadways and asphalt-macadam, for the borough council.—Mr. Marcus Wilkins, town clerk.

PRESTWICH.—October 5th.—For work of road improvement, for the urban district council.

WHEATLEY.—October 6th.—For work of road construction, for the urban district council.—The Surveyor.

SALFORD.—October 6th.—For paving, flagging and sewering works, for the corporation.—Borough Engineer.

BEDLINGTON.—October 6th.—For the supply of 5,000 tons of hand-broken road whinstone, for the urban district council.—Mr. J. E. Johnston, surveyor.

NEWPORT (Mon.).—October 7th.—For private street works, for the corporation.—Borough Treasurer.

HORNSEY.—October 7th.—For making good a passage, for the corporation.—Mr. E. J. Lovegrove, borough engineer and surveyor.

ASHTON-IN-MAKERFIELD.—October 7th.—For private street works, for the urban district council.—Mr. T. Burgess, surveyor.

HENDON.—October 8th.—For making up Love-lane, for the rural district council.—Mr. J. A. Webb, surveyor.

PAIGNTON.—October 8th.—For paving footpaths with concrete, and contingent works, for the urban district council.—The Surveyor.

BARCELONA.—October 9th.—For street paving works, for the municipality.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

KESTEVEN.—October 10th.—For the supply of granite, slag chippings and rejections, gravel, and tarred macadam, for the county council.—Mr. W. B. Purser, county surveyor, Grantham.

WANDSWORTH.—October 12th.—For the repair of part of Wimbledon Park-road, Mount Ephraim-lane, Gatton-road, and Idlecombe-road, for the borough council.—Mr. P. Dodd, borough engineer.

LONDON.—October 13th.—For paving works with creosoted deal blocks, for the county council.—Mr. G. W. Humphreys, chief engineer, Spring-gardens, S.W.

STOKE-ON-TRENT.—October 14th.—For making up certain streets, for the corporation.—Borough Surveyor.

ROCHDALE.—October 14th.—For making good part of a street, for the corporation.—Borough Surveyor.

SOUTHEND.—October 14th.—For making up a certain road and passages, for the corporation.—Mr. E. J. Elford, borough engineer and surveyor.

HARROW.—October 17th.—For widening and surfacing, and laying out an open space, for the urban district council.—Mr. J. P. Bennetts, engineer and surveyor.

Sanitary.

BANBURY.—October 3rd.—For the construction of about 1 mile of 18-in., 15-in., and 9-in. cast-iron and stoneware pipe sewers, with manholes, storm overflow chamber, erection of engine-house, refuse destructor-house, and other works, for the corporation.—Messrs. Willcox & Raikes, Union Chambers, 63 Temple-row, Birmingham.

WATH-UPON-DEARNE.—October 3rd.—For the alteration and reconstruction of the sewage disposal works, for the urban district council.—Mr. J. H. Drew, engineer.

MANCHESTER.—October 3rd.—For the supply of graded slag, stoneware pipes, best bends, stoneware covers, and stoneware underdrainage tiles, for the Rivers Committee.—Secretary, Town Hall.

BISHOP AUCKLAND.—October 5th.—For the supply of disinfectants, for the rural district council.—Dr. Penfold, medical officer of health, 9 Craddock-street, Bishop Auckland.

BILLERICAY.—October 5th.—For the construction of a pipe sewer and manholes, for the rural district council.—Mr. R. J. W. Leyland, surveyor.

WEST LANCASHIRE.—October 5th.—For sewerage extensions, for the rural district council.—Mr. A. Dickinson, clerk.

ROYSTON.—October 7th.—For alterations to sewers, manholes, and ventilators, and the construction of flushing tanks, for the urban district council.—The Surveyor.

TUTBURY.—October 8th.—For the construction of sewers and connections, and repair of drains, for the rural district council.—Mr. H. S. Tebbitt, surveyor.

PRESTON (Lancs).—October 9th.—For taking up earthenware pipes and relaying in cast-iron and earthenware socket pipes, for the rural district council.—Messrs. Myres, Veevers & Myres, 15 Chapel-street, Preston.

SOUTHPORT.—October 10th.—For a supply of salt-glazed vitrified stoneware socket-jointed pipes, bends, junctions, and gullies, for the corporation.—Mr. A. E. Jackson, borough engineer and surveyor.

ROMFORD [illegible] for the construction [illegible] for the rural [illegible] M. W. J. Grant, [illegible]

LEEDS [illegible] for the [illegible] for the corporation.—Mr. Geo. A. Hart, sewerage engineer.

SHIPLEY [illegible] tion of main outfall sewer, for the Sewerage Board. —Messrs. Willcox & Raikes, 63 Temple-road, Bir[illegible]

ALEXANDRIA.—December 8th.—For the construction of a sewerage system, for the municipality.—"M. le Président de la Commission Municipale d'Alexandrie," Alexandria.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance
‡ Provisionally accepted

ASHTON-UNDER-LYNE.—The following tenders have been accepted by the corporation:—Mr. J. Rowbottom, engineer:—

Contract No. 1: Sludge Press.—Manlove, Alliott & Co., Nottingham.
Contract No. 2: Pumps.—P. Pilkington & Co., Bamber Bridge.
Contract No. 3: Travelling Distributors.—Amos-Crosta Sanitary Engineering Company, Nottingham.
Contract No. 5: Filter Tiles.—Naylor Brothers, Denby Dale.
Contract No. 6: Filtering Media.—C. L. Stiff & Co., Birmingham.

BROMSGROVE.—For the construction of 536 lin. yds. of 6-in. stoneware pipe sewers, with manholes, ventilating columns, and other works, for the rural district council. Mr. Robert Green, engineer, Birmingham.

G. Law, Kidderminster	£479
J. White, junr., Handsworth	422
W. Thorpe, Hollywood	415
Tilt Brothers, Bromsgrove	353
Childs & Withers, Willenhall	345
Martin & Element, Smethwick*	333

CARLISLE.—For laying 1,200 yds. of 3-in. water main, for the rural district council.—Mr. F. Barker:—

W. Ferguson, Silloth	£211
Oliphant & Co., Carlisle	210
Thomson & Sons, Carlisle	205

ENFIELD.—For making up Waverley-road, Crescent-road, and Old Park-road, for the urban district council.—Mr. R. Collins, surveyor:—

Waverley-road.

Jennings & Grenfell, Waltham Cross	£1,087
E. Greenfield, Bush Hill Park	1,020
E. J. Betts, Enfield Highway*	965

Crescent-road.

Jennings & Grenfell, Waltham Cross	£555
E. Greenfield, Bush Hill Park	500
E. J. Betts, Enfield Highway*	485

Old Park-road.

Jennings & Grenfell, Waltham Cross	£982
E. Greenfield, Bush Hill Park	860
E. J. Betts, Enfield Highway*	835

HINCKLEY.—For the supply of cast-iron water pipes, for the Burbage water scheme.—Mr. E. H. Crump, surveyor and water engineer:—

Jordans, Limited, Newport	£1,614
Clay Cross Ironworks Company, Chesterfield	1,527
Sheepbridge Ironworks Company, Chesterfield	1,512
Holwell Ironworks Company, Melton Mowbray	1,511
Cochrane & Co., Dudley	1,510
Staveley Ironworks Company, Chesterfield	1,499
Stanton Ironworks Company, Nottingham*	1,486

HINCKLEY.—For the supply of hydrants, valves, &c., for the Burbage water scheme.—Mr. E. H. Crump, surveyor and water engineer:—

G. Waller & Sons, Stroud	£255
Ham, Baker & Co., Birmingham	251
Stone & Co., London	242
Glenfield & Kennedy, Kilmarnock	236
Bird & Co., London	213
Blakeborough & Sons, Brighouse	211
Hamilton, Woods & Co., Salford*	201

SUNBURY.—For the reconstruction of two roads, for the urban district council.—Mr. H. F. Coales, engineer:—

E. Free & Sons, Maidenhead	£15,384
S. Kavanagh & Co., Surbiton Hill	14,934
J. Mowlem & Co., Westminster	14,485
Franks, Harris Brothers, Limited, Guildford	13,858

Road Maintenance Company, London	12,929
Langley & Johnson, Slough*	12,089

SHIPLEY.—For construction of works at the sewage disposal works, for the urban district council. Messrs. M. Paterson & J. N. Chesson, Bradford.

W. & J. Kendall, Pudsey	£1,585
Ward & Tetley, Bradford	1,488
[illegible] & Sons, Bradford	1,250
[illegible] & Sons, Bradford	1,162

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

OCTOBER

3.—Institution of Municipal and County Engineers: East Midland District Meeting at Hinckley.
24.—Royal Sanitary Institute: Meeting at York. Discussion on "Biological Treatment of the York Sewage."

APPOINTMENTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

ARTICLED PUPIL. Vacancy occurs in office of a County Engineer and Surveyor. For full particulars apply Box 1,467, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (1,943)

THE URBAN DISTRICT COUNCIL OF PORTLAND.

The above Council invite applications for the post of Engineer and Surveyor to their district.

The person appointed will be required to act and to carry out all the duties appertaining to the office of a Surveyor to a District Council, and also Engineer to their Waterworks Undertaking, and to devote his whole time to the service of the Council. He will also be required to attend meetings of the various Committees and Council which are held in the evenings.

The salary will be £200 per annum.

Duties to commence on the 1st December, 1914.

Three months' notice to terminate engagement to be given by the person appointed.

Applicants must have had experience in a Municipal Waterworks Undertaking, and in his application must state age, qualifications and previous experience.

Accompanying the application there must be twenty copies of it, and the same number of not more than three recent testimonials. These must reach my office by 1 o'clock p.m. on the 13th October next, endorsed "Surveyor."

Canvassing members, directly or indirectly, will disqualify a candidate.

R. A. COLENUTT,
Clerk to the Council.

Council Offices,
New-road,
Portland.
September 29, 1914. (1,966)

WILLENHALL URBAN DISTRICT COUNCIL.

TOWN FOREMAN.

The above Council invite applications from competent persons for the position of Town Foreman.

Applicants must have a thorough knowledge of the duties to be performed, must be fully qualified in modern construction and maintenance of roads, sewers, &c., and experienced in the management of men and team labour.

Preference will be given to candidates who are cyclists.

Wages 35s. per week, with house.

Applications, in candidate's own handwriting, stating age (which must not exceed 45) and experience, together with copies of three recent testimonials, and endorsed "Town Foreman," to be delivered to me not later than Saturday, October 10th, 1914.

List of duties can be obtained from the undersigned.

Canvassing, directly or indirectly, will disqualify.

T. EDGAR FELLOWS,
Engineer and Surveyor.

Town Hall,
Willenhall.
September 22, 1914. (1,949)

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. OCTOBER 9, 1914. No. 1,186.

Minutes of Proceedings.

The Hinckley Meeting. At the conclusion of the East Midland District meeting of the Institution of Municipal and County Engineers which was held at Hinckley on Saturday last, Mr. E. H. Crump, Assoc.M. Inst.C.E., the engineer and surveyor to the urban district council, was warmly congratulated upon the great success which had attended the gathering. The proceedings were noteworthy for the many tributes, thoroughly well deserved, to the excellent work he has accomplished since taking up his present appointment. Mr. Crump's paper, entitled "Eleven Years' Municipal Work at Hinckley," was of considerable interest, and contained an account, at once exhaustive and concise, of the principal works carried out during the period named. The historical associations of Hinckley and its neighbourhood are unusually interesting, and some account of them formed an appropriate introduction to the paper. Among the more important questions discussed was that of the provision of workmen's cottages, and Mr. Crump gave an account of a scheme now in course of execution for the erection of twenty-eight dwellings, upon which it is estimated that there will be a very trifling annual loss after paying the instalments of principal and interest and other outgoings. He spoke with some diffidence on the question of policy, but we entirely agree with his opinion that in a district such as Hinckley, where working-men's houses are urgently required and private enterprise does not provide them, it is the duty of the local authority to build, even if the rental charged is less than it would be if the houses were erected by a speculative builder.

Among the most difficult problems which the council have had to face in recent years are those connected with sewerage and sewage disposal. In the first place, the old main sewer was in such a bad condition that a burst was not an uncommon occurrence. This has been remedied by the construction of a new outfall sewer consisting of oviform concrete tubes, the works having been designed by Mr. Crump and carried out under his supervision. The difficulty of treating the sewage may be gathered from the fact that over one-third of the total dry-weather flow consists of the waste from the dye and dry-cleaning works. The proportion of chemical refuse is therefore exceedingly high, and consequently not only is the final effluent of poor quality, but it is also dark in colour and so peculiarly liable to produce complaints. Experimental percolating beds have now been put down with the object of ascertaining whether a colourless and satisfactory effluent can be obtained by passing the sewage through a primary and secondary bed without using any lime, which has the effect of solidifying the filtering medium. In addition to the sewage disposal works, the council own the gasworks, public baths, cemetery, free library, and waterworks. In regard to the last-named undertaking, a gradual decrease in the available supply led Mr. Crump to recommend the council to proceed with the driving of certain headings, and after consulting Messrs. Hawkesley, under whom the original scheme had been carried out, it was decided to undertake this work, Mr. Crump acting as resident engineer. During the period reviewed in this paper the surveyor's department has carried out a considerable amount of work of a more routine character in connection with streets and roads, new streets, private streets, street improvements, sanitation, recreation grounds, and other matters. The general impression left by last Saturday's visit was that the present condition of the district shows what can be done by an enlightened council in conjunction with a well-qualified and energetic engineer.

* * *

Chiswick Rifle Range. The establishment of a ratepayers' rifle range at Chiswick, the formal opening of which was reported in our last week's issue, seems to deserve, and indeed to demand, some special comment. Assuming that the object is laudable, commendation is certainly due for the conception of the idea and for the promptitude and thoroughness with which it has been carried out. It was stated by one of the principal speakers that the original suggestion came from a private in the Territorials. The suggestion was adopted by the local Chamber of Commerce, at whose request the urban district council granted a site at a merely nominal rent and an open corrugated-iron shed for conversion into a range, and the council's energetic engineer, Mr. Edward Willis, acted as honorary surveyor for the reconstruction scheme. The cost of erecting the range has been defrayed by donations, so that the question of using the

[illegible] while the [illegible] to the duration of the [illegible] Chiswick [illegible] [illegible] [illegible]

The Study of Town Planning.

The important part which town planning is destined to play in the future development of towns and cities is now generally recognised. Much has already been accomplished since the Act of 1909 came into operation, and the advocates of compulsion are beginning to make themselves heard. It is evident therefore that the well-equipped municipal engineer of to-morrow ought, in addition to his other qualifications, to have had some systematic training in the laying out of towns. The announcement that a department of town planning has been established in connection with the University of London School of Architecture, and that Mr S. D. Adshead, M.A., F.R.I.B.A., has been appointed as the first professor, will therefore be welcomed by those who desire thoroughly to train themselves for the new duties which they may have to undertake in the near future. In a circular announcing the several courses, Professor Adshead outlines the principles upon which the instruction will be based. While the Town Planning Act deals exclusively with the development of land likely to be used for building purposes, and while town planning, as a subject included in the curriculum of a university, must treat the subject in a much broader way, at the same time the immediate importance of the operations of the Town Planning Act in this country justifies the department in arranging its courses of study so as to have some special reference to procedure under the Act, and while the Town Planning Act and other Public Health Acts have very little practical bearing on those purely architectural issues which are involved in the reconstruction and extension of towns, the result will prove disastrous unless the matter is considered from the point of view of elevation as well as plan. In the realisation of a town plan it is the complete effect of the architecture, as well as the underlying arrangement of the streets, that counts. The foundation of a school of town planning in London should attract not only students who may be permanently resident in the Metropolis and its vicinity, and who may be desirous of availing themselves of the advantages of a university training in this subject, but also many from the provinces and abroad who are able to spare the necessary time.

* * *

By-laws and Housing.

The paper on "By-laws and the Housing Question," which Mr. W. H. A. Court, Assoc.M. Inst.C.E., of the borough engineer's department, Leicester, read at Hinckley last Saturday, consisted in the main of a shrewd and practical defence of the model code. In analysing the influence of by-law requirements on the building of cottages by private enterprise, Mr. Court pointed out that the possibility of producing a remunerative scheme depends not only upon the cost of the building proper, but also upon the cost of the site, which is not affected by the by-laws, and the cost of road making. It has been suggested in many quarters that the actual cost of building might be reduced either by a general modification of the requirements of the by-laws, or at least by rendering the by-laws flexible so that they can be adapted to the circumstances of particular cases. The matter is one in regard to which there has been a good deal of general discussion without a true appreciation of the real considerations involved. It must be borne in mind that the existing code represents what have hitherto been deemed to be the minimum requirements to secure stability and to safeguard the public health. In certain districts, no doubt, antiquated by-laws need revision, and the Local Government Board have taken steps to urge on this work. With regard to road making, we think that a better case for relaxation can be made out. Mr. Court urges as an argument in favour of the retention of existing requirements that the admittedly high cost of construction is balanced by the comparatively low cost of subsequent maintenance, repair, and cleansing. It must not be forgotten, however, that the cost of construction falls upon one body of persons—namely, the frontagers—whereas the cost of maintenance falls upon another distinct body of persons—the general ratepayers. It is often a difficult matter to hold a fair balance between the two, and we are by no means sure that a uniform application of model by-law requirements in regard to road making does not in many cases cause appreciable hardship upon the former.

* * *

Municipal Housing and Distress.

The minds of many surveyors and others have been much exercised by what has come to be a very general opinion as to the suitability of the erection of workmen's cottages as works which may be undertaken by a local authority with a view to relieving distress. Some official sanction has been given to this opinion by reason of the fact that at the outbreak of the war the Government allotted a large sum of money to be devoted to assisting local authorities to finance housing schemes. It is of course assumed that such works will not be undertaken unless a real need exists for more cottages in the district, but even where this condition exists, what proportion of the total sum spent on each trade goes to pay for labour? A suggestion has reached us from an influential quarter that reliable information on this point at the present juncture would be not merely interesting, but really valuable; and, feeling sure that many of our readers who have themselves carried out housing schemes must have such information in their possession, we venture to ask that they will send it to us for publication in the common interest. It is suggested that information regarding a semi-detached cottage, built in a medium-sized or small provincial town at a cost of about £200, reckoned on a basis of 4¾d. per foot cube, apart from levelling and fencing, but including drainage, would be specially useful. We trust that the urgency and importance of the matter will produce a ready response to our correspondent's request.

* * *

Sanitation and War.

The letter from Captain Arthur J. Martin, of the 2nd London Sanitary Committee, which appears on another page of this issue, should be the means of inspiring many of our readers with the answer to the question that so many of us are now asking—"What can I do at this crisis to help my country?" It is evident that the sanitation of our numerous camps is of the utmost importance. It is impossible to gather together large bodies of men without some risk of epidemics, unless proper precautions are taken, and it is on these lines that volunteers are required to assist in the sanitation of our home camps. There must be a large number of men, who have more or less knowledge of sanitation, who would greatly benefit by at once enlisting in this Sanitary Company for home service. They would not have to go abroad, and the experience they would gain would be invaluable to them in after life. This is an opportunity for patriotism and self-advancement combined that does not often occur in a man's life, and we feel confident that there will be a very general response to this appeal.

D*

Institution of Municipal and County Engineers.

EAST MIDLAND DISTRICT MEETING AT HINCKLEY.

Municipal and County Engineers at Snarestone Waterworks.

[illegible] East Midland District, has every reason to be grati[illegible] the Institution of Municipal and County Engineers in the progressive Leicestershire town which he serves [illegible] surveyor. Although officially described as a district, as distinct from an ordinary meeting, the president, Mr. J. S. Pickering, and many other prominent members from distant parts of the country, were among the company of seventy or more who attended the gathering, which opened at the offices of the district council shortly before mid-day. Two papers: "Eleven Years' Municipal Work at Hinckley" and "By-laws and the Housing Question," by Mr. Crump and Mr. W. H. Court, Assoc.M.Inst.C.E., Leicester, respectively, were submitted for discussion, and the afternoon was devoted to an interesting round of [illegible] waterworks, about 14 miles from the town. There was one unlooked-for difficulty, for the surmounting of which considerable credit is due to Mr. Crump. During luncheon it transpired that the motor charsa-banes which had been ordered for the journey had been unexpectedly requisitioned by the military, and it says much for the promptitude with which Mr. Crump dealt with the situation when it is stated that when the time came for departure he had managed—[illegible] to secure nearly thirty cars in the place of the commandeered vehicles. No fewer than a dozen private cars were placed at the disposal of the members, and the remainder were hired from various garages. Without the private vehicles, however, it is somewhat doubtful whether the visit could have taken place, and it is fitting, therefore, that the action of the owners should not pass unrecorded. Other undertakings inspected in the course of the day were the public baths adjoining the council offices and the workmen's dwellings which have been erected, or are in course of erection, under Mr. Crump's superintendence; and a visit which was paid to Gopsall Park Gardens, by the permission of Earl Howe, brought to an end a meeting which was as enjoyable as it was instructive to those who participated in it. The attendance included Messrs. L. Baldwin (Coalville), F. Bennett (Leicester), R. Blanchard (Cannock), A. Carter (Oakham), W. G. Clarke (Wigston), H. Coleby (Atherstone), F. C. Cook (Nuneaton), W. H. Court (Leicester), H. Coales (Market Harborough), G. E. Clarke (Boston), E. H. Crump (Hinckley), S. Douglas (Kenilworth), G. E. Fryer (Melton Mowbray), E. J. Goodacre (Shrewsbury), A. D. Greatorex (West Bromwich), T. W. Hayward (Battersea), E. Jeeves (Melton Mowbray), G. Killick (Finsbury, London), T. Lake (Bourne), F. W. Mann (Leicester), R. MacBrair (Lincoln), R. Moon (Nuneaton), W. Moorhouse (Melton Mowbray), T. Negus (Meriden), W. Plant (Stafford), J. S. Pickering (Cheltenham), G. Pearson (Marlborough), A. G. Ross (Lutterworth), G. Rawson (Worksop), S. Turner (Ashby), F. Tyson (Leicester), T. Wood (Leicester), A. H. Walker (Loughborough), W. S. Woodcock (Oakham), H. G. Whyatt (Grimsby), F. Wright (Ilkeston), members; A. S. Atkins (Hinckley), A. Abbott (Hinckley), J. Bennett (Hinckley), J. Burnett (Nuneaton), P. Benn (Lichfield), W. H. Bott (Hinckley), W. Bray (Hinckley), G. Cholerton (Hinckley), G. Featherston (Worksop), J. S. Featherston (Hinckley), W. Greatorex (West Bromwich), Dr. Bostock Hill (Birmingham), T. Harrold (Hinckley), C. Hands (Burbage), F. Harris (Charlton Kings), W. Johnson (Hinckley), W. Keay (Leicester), G. Kinton (Hinckley), F. Lee (Hinckley), D. W. Lansdown (Hinckley), A. Mitchell (Charlton Kings), A. W. Oakey (Leicester), J. W. Preston (Hinckley), J. Pratt (Hinckley), Dr. Robinson (Leicester), F. A. Simmonds (Hinckley), F. Tuckey (Earl Shilton), W. Veasey (Hinckley), G. Woodston (Snarestone), G. Walker (Nuneaton), F. Warner (Birmingham), W. Warner (Hinckley), J. Warner (Hinckley), T. Williams (Nuneaton).

Mr. G. Kinton, chairman of the urban district council, gave the members a hearty welcome to Hinckley. They felt that the institution had paid the town a very great compliment in deciding to hold their meeting in Hinckley. They knew how very dependent they were upon the labours of municipal engineers for the health and welfare and comfort of the community, and they sincerely hoped that the interchange of ideas would be for the benefit of the public. Hinckley, though small, was a progressive and prosperous town from the industrial point of view.

Mr. W. H. Bott, a member of the council, also joined in the welcome to the institution.

The President (Mr. J. S. Pickering) said that it was his privilege to thank the chairman and the council very heartily for the kind reception they had given them. He was engineer and surveyor to the neighbouring town for many years, and he had something to do with the training of Mr. Crump and his predecessor, both having been very valued assistants of his own. Both Mr. Cook and Mr. Crump had by their

efforts won the high opinion of the Hinckley Council, and gained the esteem and respect of their fellow members of that institution. The paper prepared by Mr. Crump was undeniable testimony to the great progress the town had made. He remembered the time when Hinckley did not possess a public water supply; he also remembered the very great difficulties which had to be overcome of securing a source of supply, and their present scheme had been a very great boon to the inhabitants, and, fortunately, had proved a financial success. That could only have been brought about by an authority imbued with the determination of overcoming the great difficulties with which they had to contend. The same spirit of progress could be seen in connection with their gasworks.

Mr. G. Kinton, J.P.,
Chairman of the Hinckley Urban District Council.

their baths, and their dwellings for the working class. They as engineers recognised that none of those works could have been brought to a successful issue unless they had the advice and management of the able officials who were entrusted with the management of those undertakings.

Letters of apology for non-attendance were announced from Messrs. E. G. Mawbey (Leicester), Norman Scorgie (Hackney), H. J. Clarson (Tamworth), S. Maylan (Basford), T. Fenn (Belper) and F. Hopkinson (Worksop). It was also announced that Mr. E. P. Hooley (Notts) was on service with the Territorials.

On the motion of Mr. T. W. A. Hayward (Battersea), a vote of sympathy was passed with Mr. Mawbey, whose absence was due to illness.

ELEVEN YEARS' MUNICIPAL WORK AT HINCKLEY.

By E. H. Crump, Assoc.M.Inst.C.E.,
Engineer and Surveyor to the Urban District Council.

Hinckley is midway between Leicester and Coventry, and within 2 miles of the old Roman-road, the Watling-street, part of which is in the urban district. It is also within 6 miles of the High Cross, where the Fosse Way crosses, the acknowledged centre of England, as defined by the Romans.

The early days of Hinckley were mostly agricultural, as the numerous old farmyards in existence in various parts of the town revealed, less than a century ago.

The first stocking frame was introduced in 1640, gradually developing into the staple trade. The boot and shoe industry was installed in later years, and this has also become another important industry in the town. At present there are twenty-five hosiery and boot factories in the town. The well-known Sketchley dye works, although not situate in the urban district, are just beyond the boundary, and the majority of their large number of employees reside in Hinckley. There is also another dye works in the town, and at these two dye works the greater part of the hosiery manufactured in the town is dyed.

STATISTICS.

The following are the general statistics:—

Area of district, 3,729 acres.
Number of inhabited houses, 3,050.
Average number of persons per house, 4·34.
Rateable value, £47,720.
Annual amount produced by a 1d. rate, £150.
Rates: General District, 4s. 8d.
Poor, 3s. 10d.
Water, 1s. 6d.
Total, 10s. in the £.
Height above sea level at lowest part of district, 300 ft.
Height above sea level at highest part of district, 450 ft.
Death-rate last year, 13·1.

The population in 1881 was 7,673; in 1901, 11,304; in 1911, 12,838; and the estimated population is now about 13,250, thus showing that the growth of the town is gradually on the increase each year.

The council own the gasworks and waterworks, and also have their own sewage disposal works, public baths, cemetery, and free library.

STREETS AND ROADS.

The total length of roads repairable by the council is about 15 miles, and of these 2½ miles are main roads, towards the maintenance of which the county council contribute £150 per mile per annum.

The whole of the stone used in repairing these roads is obtained from the neighbouring quarries of the Enderby and Stoney Stanton Granite Company, Limited, and the Mountsorrel Granite Company,

Mr. E. H. Crump, Assoc.M.Inst.C.E.,
Engineer and Surveyor to the Hinckley Urban District Council.

Limited, which are only 4 miles distant, and from which the stone is hauled direct on to the roads.

During the past four years various experiments have been tried in the coating of roads with bituminous material, the author being of opinion that every surveyor should himself experiment to ascertain which is the best and most economical method of road making for his particular district.

The following experimental portions have been laid down:—

3-in. coating of quarrite material at 2s. 10d. per square yard.
3-in. coating of tarred slag at 2s. 8d. per square yard.
3-in. coating of granite, tar and pitch grouted, at 1s. 7d. per square yard.
3-in. coating of tarred limestone at 2s. 7d. per square yard.
3-in. coating of tarred granite at 2s. 6d. per square yard.

Sufficient information has not yet been obtained to state definitely which method is the best for this district.

It must be confessed that one or two lengths have been failures. However, the author feels satisfied that such experiments were made, as it taught him not to proceed any further in the methods which proved rather disastrous.

found necessary last year to resurface it in the middle.

One great drawback in the Hinckley roads towards [illegible] and consequently, when tarred or resurfaced with tarred material, are rather dangerous in wintry weather.

[illegible] vours, as economically as possible, to lower the crown of the roads by scarifying the surface, removing the dirt and dust, and replacing the screened stone.

Up to the present the experiments led the author to believe that, for an urban district like Hinckley,

Mr. A. S. Atkins,
Clerk to the Hinckley Urban District Council.

where the traffic is not very excessive and where initial cost is a very important item, seeing that a 1d. rate only produces about £150, a good serviceable road can be obtained by a layer of granite laid in the water-bound method, such surface being tar-sprayed twice after the road has become quite dry, and also that the tar-spraying of roads as quickly as possible after the road has been repaired and becomes dry considerably enhances the life of a road.

There is no doubt that all district surveyors would like to pave the whole of their roadways with a proper bituminous material, but the initial outlay is always the barrier, whereas a road can be surfaced and doubly tar-sprayed for a matter of 1s. 6d. per square yard.

The argument that a bituminous road lasts three or four times longer than a water-bound road is no doubt correct, but the fact still remains that the initial outlay of the former cannot be undertaken by smaller authorities.

The experiments with the tar and pitch grouted methods have not proved altogether successful, the nuisance experienced from the "weeping" of the road in hot weather, and the complaints received concerning damaged carpets and dresses have definitely deterred the author from attempting any similar work in the future, yet at the same time it is only fair to state that the experimental portions, although having been laid down now three years, show very little signs of wear.

Hinckley during the past eighteen months has been in the unfortunate position of having most of the roadways and footways in the town disturbed by the new electric and telephone cables laid down by the Electric Power Company and the Post Office Department, consequently the streets do not possess such a neat and level appearance as the author would like. The work of reinstatement of these trenches is undertaken by the council, the whole expense being borne by the authorities making the trenches.

Most of the roads in the town are tar-sprayed, the [illegible] amounting to approximately 5 miles, at a cost of 1d. per square yard.

Distilled tar is used, the material being obtained from the council's gasworks, at the rate of 3d. per gallon, or £2 10s. per ton, a proper still having been erected by the manager for this purpose. Granite chippings are used for binding the surface after the spraying, and the whole of the work is carried out by machines manipulated by the council's workmen.

During the past few years many of the footpaths of the town, which formerly were of roughly dressed setts, &c., have been repaved, either with tarred limestone or concrete slabs, and properly kerbed [illegible]. A sum of £2,000 is spent in this direction last year, and there still remains a fair amount of new work to be done, but with other larger schemes on hand the council have been compelled to postpone other new paving, &c., for a time.

Akonia is used as a dust layer on the streets which cannot be tarred owing to their steep gradient, and has been found most successful.

New Streets.

During the past eleven years six new streets have been laid out by speculators, and all have been taken over by the council after completion, under the Private Street Works Act, 1892. All streets are 36 ft. wide, and have a 6-ft. paved footpath on either side.

The following is a brief specification required to be adhered to by the council in the formation of new streets: A 2-in. layer of ashes before the 8 in. of granite pitching is laid, then another 2 in. of ashes are placed on the pitching before the two 3-in. layers of broken granite are put on.

The ashes prevent, to a very great extent, the clay working up into the pitching and macadam, and thus no creeping is experienced when steam rolling.

The footpaths are kerbed with 6-in. by 12-in. dressed granite kerbs and four rows of 4-in. by 4-in. granite setts, and paved with 2-in. concrete slabs.

A new street, including a 9-in. sewer, paved footpaths, &c., complete costs about £4 7s. 6d. per lineal yard.

In all new streets trees are planted to improve the bare appearance, seeing that there are not many in the existing streets of the town. Limes and planes have been adopted in each case, and the cost per tree fixed, including an inexpensive guard, works out at about 7s.

Private Streets.

At the time of the author's appointment there was a considerable number of private streets and private yards in the town, and all of these have now been properly made up and put into a good state of repair.

The streets were carried out under the Private Street Works Act, 1892, while the repair of the yards was carried out by agreement with the owners. Before the work was undertaken all the yards were paved with "petrified kidneys," which material also formed the surface of several roads in the town.

Altogether there are about twenty private yards in Hinckley, and most of these yards contain a fair number of dwelling houses, and have a public right of way through them, leading from one street to another. The paving of these yards with granite setts or tarred limestone has been completed in most cases, but a few still remain to be done. The cost of the whole of this work has been carried out at the expense of the owners, by the council, by agreement. It was not thought advisable to carry out this work under the Private Street Works Act, and it can easily be understood that a fair amount of persuasion had to be used in order to obtain the sanction of the owners, who, however, finally saw the great improvement effected in the cleanliness of the yards, and acknowledged the necessity of it.

Street Improvements.

Hinckley being a very old town, many of the streets are narrow, and the council have never lost any opportunity of widening such streets when the chance arose. In most cases the owners have given up the necessary land, the council bearing all cost of new fences and the widening of the road and footpath. Since the author's appointment about £2,500 has been spent in this direction, while in one case the council purchased a site known as the Workhouse-yard, containing ten houses, at a sum of £1,000, demolished the whole of the buildings, and constructed a new street through the site, and provided an excellent connection between two important thoroughfares.

The author commends this spirit of owners in Hinckley of giving up land for street widening without payment to other towns, for the council here has always been readily and generously met by the parties owning the required land.

applications are still being received for the ones now being completed, thus showing the need for the council to proceed further in the matter.

The following is the estimated balance-sheet of the sixteen houses now in course of erection.

ESTIMATED BALANCE SHEET.

Estimated Receipts.	£	s.	d.
Rents from 16 houses, let at 5s. per week	208	0	0
Less two weeks' loss of rent each 16 at 10s.	8	0	0
	£200	0	0
Estimated yearly loss	2	9	1
	£202	9	1

Estimated Expenditure.	£	s.	d.
Repayment of loan, principal and interest (at 3½ in respect of—			
(a) Land, 3,044 square yards, estimated at 2s. 9d. per square yard (£419 for 80 years)	15	13	2
(b) 16 cottages (£2,800 for 60 years)	112	5	3
District and poor rates, 16 at £1 16s. 8d. per annum	29	6	8
Water rates 16 at 15s. per annum	10	8	0
Insurance—16 at 3s. per annum	2	8	0
Property tax 16 at 9s. per annum	7	4	0
Yearly repairs—16 at 25s. per annum	20	0	0
Supervision and collection of rents (2s. per week)	5	4	0
	£202	9	1

SANITARY CONDITION OF THE TOWN.

Up to within fourteen years ago most of the sanitary conveniences of the town were of the privy midden and pan type.

Mr. F. C. Cook, the author's predecessor, first tackled the problem, and obtained the conversion of a number of these nuisances into water closets. The author continued the work, and has been successful in practically abolishing the whole of the privies and pans in the town, with the exception of a few isolated cases. The whole town is now provided with proper water-closets, and the old type of brick ashpit as a receptacle for ashes is now very rapidly disappearing to give place to the galvanised bin.

No portion of the cost of this conversion has been paid by the council, the owners having been persuaded to carry out the work, and in only a very few cases was it found necessary to serve statutory notices.

The whole of the refuse is tipped at the council's sewage farm and burnt, but as the site is now becoming filled up, the question of a refuse destructor is being considered. All dustbins are emptied once weekly, and trade refuse is collected at a charge of 1s. per load.

HOUSING.

The question of the provision of workmen's houses has occupied the attention of the council, especially since the Housing, Town Planning, &c., Act, 1909, came into operation; but it was not until last year that an area of 4½ acres was purchased in Coventry-road for the purposes of a small recreation ground for this portion of the town, and also for a site for workmen's dwellings. An area of 2½ acres was levelled and laid out for the recreation ground, and 2 acres were allotted for houses and a new road. The author was instructed to prepare several designs of types of houses, and the council were originally in favour of the six-roomed cottage, but the Local Government Board did not approve of this type, and houses containing five rooms were then decided upon. The area allotted for houses will, when built upon, contain twenty-eight cottages, and of these twelve are completed and occupied, and the remaining sixteen are in course of erection. The dimensions of the various rooms are shown on the accompanying drawings, and each house stands on a site of an average area of 180 sq. yds. There is nothing extraordinary in the design of the cottages except that all rooms are of a good size, well lighted and ventilated. The closets and coal-houses are under a different roof to that of the main building, as this arrangement, in the author's opinion, is preferable to these offices taking up the space out of the scullery. The division walls between the bedrooms are of "Fram" partitions, 2½ in. thick, and the whole of the paving at the rear and side of the cottages is of 2-in. concrete slabs. The houses are set back 10 ft. from the street fence line, the front garden being turfed. Each house is provided with town and soft water and gas, and the rent is 5s. per week.

There is no doubt that such houses were urgently required in the town, as there has been a marked decrease in the number of new houses erected during the past few years, such depression being general throughout the county; also a fair number of houses have been closed, either by the council or voluntarily by the owners, and demolished, and consequently the supply of new houses is quite insufficient to the demand. Over seventy applications were received from probable tenants for the first twelve houses, and daily

At present there is not a house of a weekly rental between 4s. and 6s. unoccupied in the town.

As to whether it is wise procedure for councils generally to undertake the building of cottages is not a question for the author to comment upon, but it is his opinion that in a district such as Hinckley, where working-men's houses are urgently required, and private enterprise does not provide them, then it is the council's duty to build, even if the rental charged is less than it would be if the houses were erected by speculators.

RECREATION GROUNDS.

The council possess one recreation ground of 10 acres in area, which is provided with a bandstand, swings, &c. It is now being improved by the construction of walks and shrubberies, and it is proposed to level a considerable portion of it next year, as the present condition is far from satisfactory. The other recreation ground is the one recently formed in connection with the housing scheme, and is only 2½ acres in area.

PUBLIC BATHS.

These buildings were erected from the author's design in 1910, and are very plain in character, yet at the same time are quite sufficient for the needs of the town. The buildings comprise an entrance hall, swimming-bath hall, with pond 75 ft. by 25 ft., four slipper baths, and laundry and boiler-house. There is sufficient space for additional slipper baths to be erected when required.

The heating of the swimming-bath water is by steam admitted from the deep end, and the hot water for the slipper baths is obtained from a calorifier fixed in the pipe subway.

Like most other baths in the county, the annual expenditure considerably exceeds the receipts, and for the past four years the average total expenditure, including repayment of interest and instalment of loans, has been £575, while the receipts have been £263, showing an average annual nett loss of £312, which means, approximately, a 2d. rate. The cost of the baths was: Buildings, £3,000; site, £300; or a total of £3,300.

The baths are appreciated and considerably used in the town, and are only open from April to October each year. Special facilities have been provided for bathing for the scholars of the various schools in the town. The dressing-boxes are collapsible, so that additional space is thus provided for spectators at polo matches, &c. The whole of the buildings are heated throughout by means of hot-water pipes and radiators, and the washing and laundry work is executed by steam machines.

CEMETERY.

The cemetery is about 7¼ acres in extent, and is provided with the usual chapels and sexton's house. Difficulty has been experienced with water in the excavation for graves, and the council are now considering a scheme for underdrainage. The nett expenditure after deducting all receipts per annum is about £100.

SEWERAGE AND SEWAGE DISPOSAL.

The sewerage of the district is, generally speaking, by the combined system.

Up to last year the main outfall sewer for the whole town was only 18 in. and 21 in. in diameter, and was in an extremely bad condition owing to the running sand, &c., in which it had been laid. It frequently burst and caused a collapse in the roadway, and also

a portion of the town was flooded in times of storm. In 1912 the author was instructed to prepare scheme for a new outfall sewer, and carried out the work, and consisting of concrete tubes varying in size from 42 in. by 28 in. to 30 in. by 24 in., was laid last year at a cost of about £5,200, the total length being just under a mile.

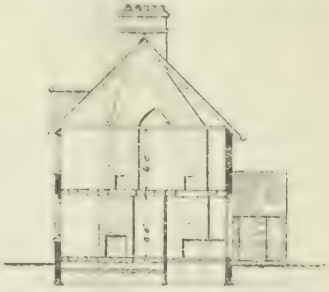
A fair amount of running sand and water was again

All drain connections to the sewers are carried out by the Council at a uniform charge of 25s., paid in advance.

The council have a sewage farm, of which the following are the general particulars:—

Area of farm, 119 acres 1 rood.
High-level portion of farm, 52 acres 3 roods.
Low-level portion of farm, 66 acres 2 roods.

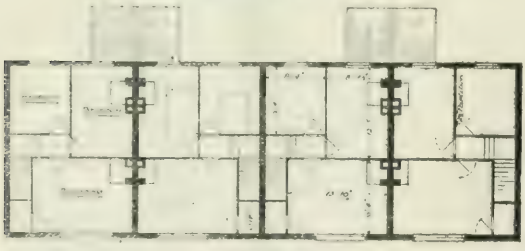
Front Elevation of One Block.



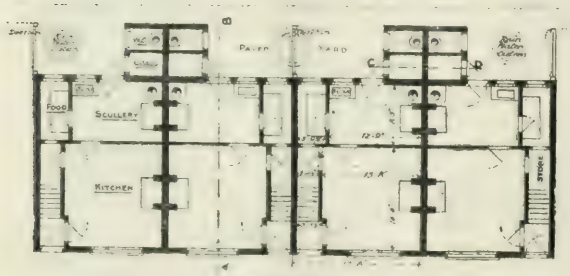
Section A B.

Back Elevation of One Block.

Section C D.



First Floor Plan.



Ground Plan.

Hinckley Workmen's Dwellings.

Area of ploughed land, 51 acres.
Area of grass land, 61 acres 1 rood.
Settling tank accommodation, 350,000 gallons.
Average dry-weather flow from town, 310,000 gallons per diem.
Average daily flow treated from Sketchley Dye Works, which works are outside the urban district, 120,000 gallons per diem.
Quantity and cost of lime used per annum, 265 tons, costing £195.
Cost of gas for engines per annum, £270.
Total expenditure on farm (including £800 for repayments of loan and interest) per annum, £2,570.
Amount per annum received from the Sketchley Dye Works for treating 120,000 gallons per diem, £150.
Other receipts from grass-keeping and crops, £360.

The method of treatment of the sewage is as follows:—

On arrival at the works the sewage is screened, mixed with lime water, and flows into one of the settling tanks. When the tank is filled—each tank holding about 60,000 gallons—compressed air is admitted by means of perforated pipes laid at the bottom of the tank, and thoroughly agitates the whole of the contents and mixes the existing sludge at the bottom of the tank with the sewage recently admitted, and causes an effective precipitation, and to a certain degree aerates the sewage.

The compressed air is admitted for about ten minutes, then shut off, and the sewage allowed to precipitate. After settling for an hour, the clarified sewage is drawn off by means of floating arms to a depth of about 12 in. from the bottom of the tank, this depth of sludge always remaining in until such time as the tank requires cleaning out and the accumulated sludge removed. The effect of the compressed air is

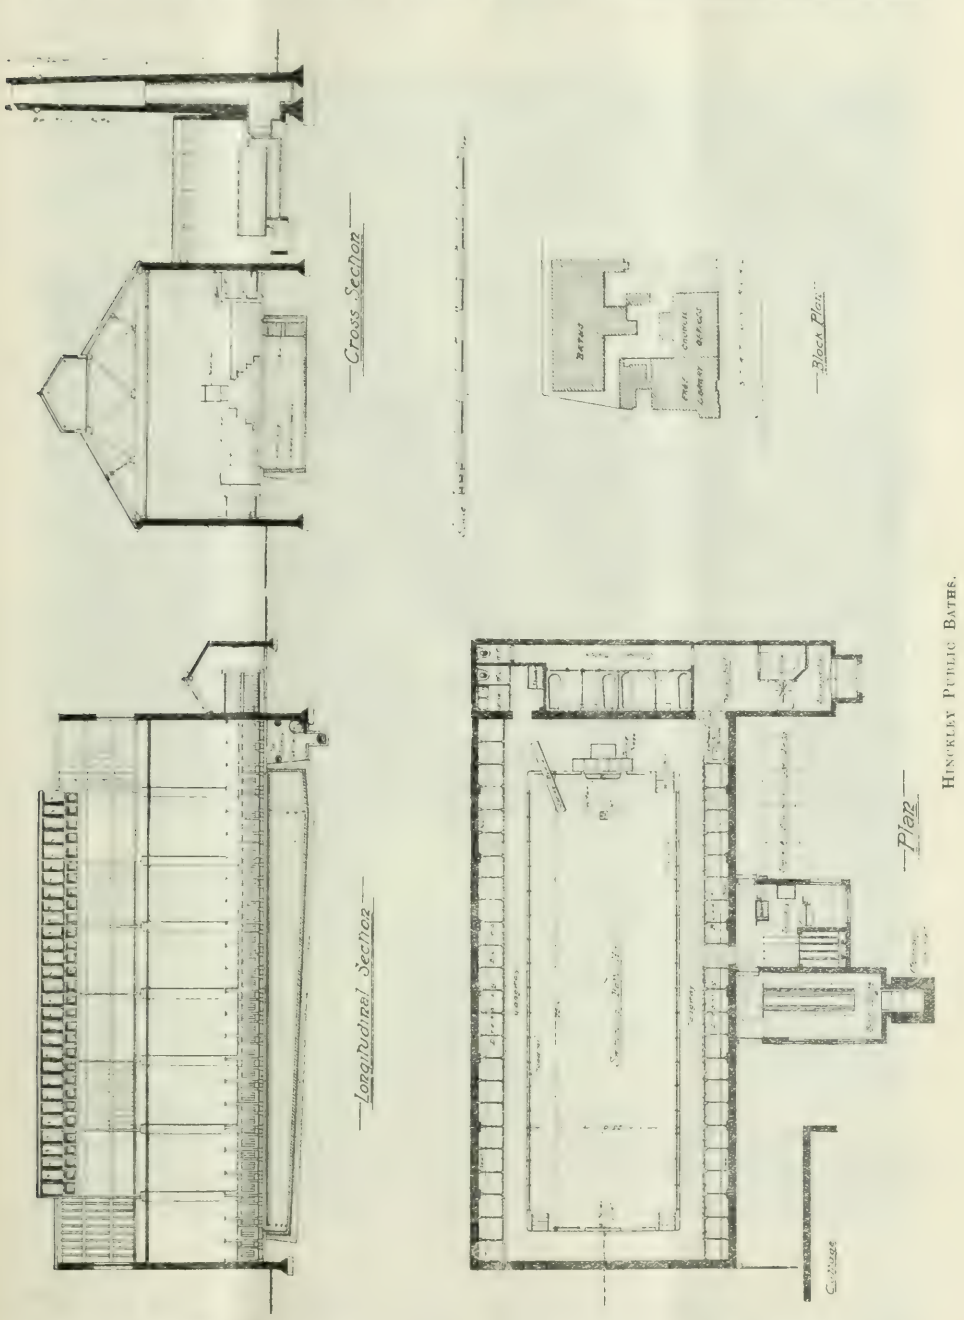
encountered, but the work was carried out by contract in a satisfactory manner.

As regards ventilation of the sewers, ventilating columns are erected where necessary, and advantage has been taken of connections to one or two tall factory chimney shafts.

wonderful in the clarifying of the sewage, considering the most difficult sewage which has to be treated. This "blowing up" was inaugurated about three years ago by the author and Dr. Robinson, the county medical officer of health, and it is gratifying to note the improvement on the surface of the land by reason of the less amount of suspended matter now pumped up in the sewage. The effect of the blowing up is only in the clarification of the sewage and not in the purification. The sewage, after being pumped on to the high-level land, passes into the under-drains; thence it is conveyed on to the low-level land, which is also under-drained, and finally the effluent is conveyed, by means of open carriers, into the Sketchley Brook.

(To be concluded.)

We understand that Messrs. J. Baxter & Sons, Castlestreet, Hinckley, who photographed the members at the Sharestone waterworks, are prepared to supply copies of the group at the usual postcard rate.



By-laws and the Housing Question.—The paper read at Hinckley by Mr. W. H. Court will appear next week.

VOIDLESS ASPHALT MACADAM ROAD CONSTRUCTION.

NEW MIXING PLANT: DEMONSTRATION AT SUNNINGDALE.

On Wednesday of last week a number of Press representatives had an opportunity of inspecting the new Asphalt macadam mixing plant used by Highways Construction, Limited, Finsbury-pavement, E.C., in operation at Sunningdale in connection with the reconstruction of long lengths of road on each side of Virginia Water. The visitors were accompanied by representatives of the firm in the persons of Mr. H. F. Berry (director), Mr. Lovatt, Mr. H. G. Gray, and Mr. E. W. Delacour.

The plant operating at Sunningdale is one of a number of such plants which are at present working at Harold Wood, Putney, Wanstead, Southend, Cornwall, Bristol, and Newcastle. Further plants are being erected at other points for the manufacture of the company's voidless asphalt macadam, which has taken a premier place among modern road systems.

The plant at Sunningdale represents some improvements on the original plant, securing greater mechanical efficiency, but apart from this all the above-mentioned plants work on the same principle.

The process, briefly stated, comprises the following operations:—

(1) Drying and heating the sand and stone.

(2) Mixing and delivering the material to mixing chamber.

(3) Melting, heating and adding the bitumen.

(4) Thorough mixing and delivering to carts at correct temperature.

The hot asphalt macadam is then carted away to be laid on the road at a temperature of about 300 deg. Fahr. The approximate output of the plant is from 70 to 80 tons per day, which is equal in yards super. to about 700 or 800 yds. of carpet work; or, in the case of double-coat work, 400 to 450 sq. yds.

As there are two of these plants located at Sunningdale the work is being carried out at a very expeditious rate. The object that has been kept in sight in the design of the plant has been to secure the absolute control of the grading of the asphalt macadam mixture, and of its temperature at all stages of the process. This object has been attained with such accuracy that any predetermined percentage of bitumen can be readily secured and the temperature of the materials at any stage of the process can be regulated with exactitude. The importance of this is that there is no risk whatever of the materials being overheated or burnt—a valuable feature where bitumen is concerned.

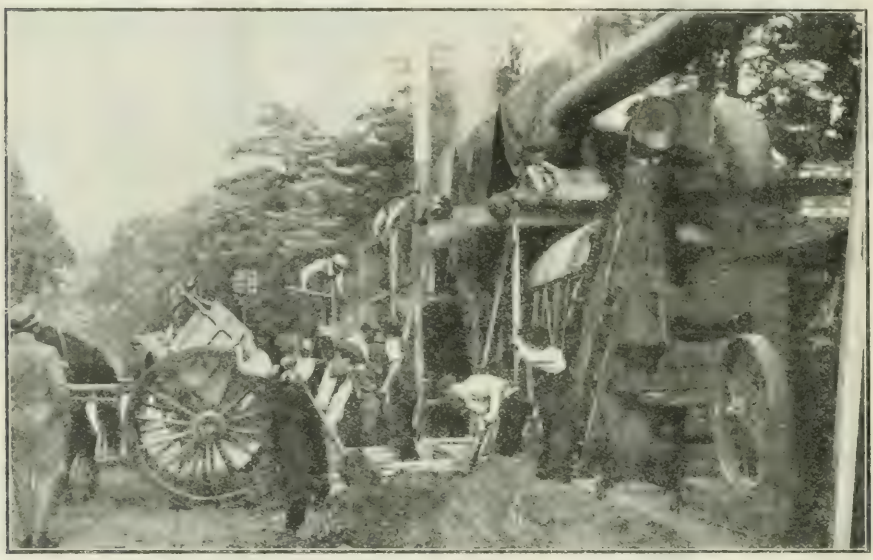
The character of the plant will be seen from the accompanying photographic views.

The process of voidless asphalt macadam road construction is now well-known to surveyors, and comprises single coat or carpet works and double coat work. In the latter case the first course contains a mineral aggregate of fairly large gauge, and when this has been rolled and shaped the carpet course is superimposed. In the single coat work only the carpet course is used. It may be mentioned that carpet work has been very successfully employed on granite setts and worn macadam roads. The thickness of the two coats is approximately 2 in. and 1 in. respectively.

Among other important contracts now being carried out by Highways Construction, Limited, the following may be mentioned:

At Essex [illegible] 5 and 6 miles of road are being laid between Romford and Brentwood.

At Sunningdale the present work comprises about 5 miles of road which are being laid under the supervision of Mr. A. Dryland, the county surveyor of Surrey; and at Southend a contract for about 7 miles of roads is being carried out. It is interesting to note that over 23,000 sq. yds. have already been laid at Southend, and the present contract is a proof of the satisfactory results of the previous work.



The Asphalt-macadam Mixing Plant at Sunningdale.

There are other contracts being carried out at Grove End-road, Marylebone, Chorley-road, Black Rod, at Ramsbottom, Cornwall, and Bristol.

In all the above cases the company is carrying out the entire contract, but interesting variations from these arrangements may be noted:—

(1) In the metropolitan borough of Battersea, where the asphalt macadam is delivered to the site, and the council supply the labour and equipment, the road is being constructed under the supervision of Mr. T. W. A. Hayward, the borough surveyor.

(2) The borough of Hornsey have arranged for the hire of a plant, and are themselves carrying out the entire process. In this case the borough surveyor, Mr. E. J. Lovegrove, is using as the mineral aggregate clinker from the local dust destructor crushed to a suitable gauge, and the results so far appear to be exceedingly satisfactory. Numerous further examples of the company's work are to be seen in other parts of the country.

The bitumen used is the well-known brand Mexphalte, and an inspection of the road being laid at Sunningdale reveals the efficiency of the process, while the results in service will doubtless demonstrate its durability—already proved in roads which were laid in and around London several years ago, and which at the present day look none the

[illegible] for the [illegible] heavy motor traffic that has been passing over it. It will be recalled that in a recent issue Mr. L. S. McKenzie, the city surveyor for Bristol, described the excellent wearing capacity of roads laid under his supervision in that city by Highways Construction, Limited.

Messrs. Highways Construction, Limited, have this year been extending their operations abroad, although these have naturally been curtailed by the war, and

Laying Voidless Asphalt-macadam.

it may be mentioned that just prior to the outbreak of hostilities arrangements had been made for trial stretches to be laid in certain cities of Belgium, while an important contract for 1,000,000 sq. yds. has been secured for a Continental capital. Work on this contract will shortly be commenced.

It is generally agreed that bituminous roads are the highways of the future, and there is a tendency on the part of municipal engineers to acquire a mixing plant to execute their own work. Accordingly a small compact mixing plant has been devised embodying all the features of the larger apparatus at [illegible]. This is now being manufactured and will shortly be available for hire or purchase.

Rolling a Section.
The road is laid in half-width sections.

H. S. T.—Your application duly received and having attention of authorities.

MUNICIPAL WORK IN NEWCASTLE-ON-TYNE.

CITY ENGINEER'S REPORT.

Covering an area of 5,452 acres, the city of Newcastle-upon-Tyne possesses at the present time an estimated population of 273,415. Its rateable value is £1,270,918. Of inhabited houses—each flat being counted as one house—there are 50,699. The city's highways have a total length of 253 miles, and there are 276 miles of sewers. Bridges maintained by the corporation number twenty-seven; parks and open spaces cover an area of 1,400 acres, and there are no less than 62 miles of tramways (measured as single track).

A diagram in the last-issued report of the city engineer and surveyor, Mr. W. J. Steele—from which the above statistics are extracted—indicates a somewhat remarkable change in the character of dwellings erected in the city. In 1898, of the total number of dwellings erected, 9 per cent were in self-contained houses and 91 per cent in flats, whereas last year 84 per cent were in self-contained houses and 16 per cent in flats. "Prior to 1909," observes Mr. Steele, "it seems evident that in several years more dwellings were erected than were necessary to meet the natural

increase of population, but the rapid decline in building since that year has filled up the voids at such a rate that, unless there is a marked increase in the number of new dwellings in the near future, the shortage of houses will become a serious problem."

ROADS.

Nowadays [illegible] about 48 miles of the highways surfaced with tar-macadam. During the last five [illegible] paving [illegible] with this material, but as there remain about 100 miles of chip-paved streets, it will be many years before the whole of them can be resurfaced. "In some towns," Mr. Steele remarks, "it is claimed that modern methods of road construction will reduce the cost of maintenance of the highway, but this much-desired result will probably not be realised in Newcastle; against all the disadvantages of chip pavement it has the virtue of being a cheap surface to maintain. However, it is so unsatisfactory to the demands of modern traffic that it will not be tolerated any longer than the necessity for keeping maintenance costs within reasonable limits will permit."

The approximate total length of highway now maintained by the corporation is 253 miles. The cost of maintenance per mile, exclusive of debt charges, varies with the amount of traffic, but over the whole length, and after reducing the total mileage to a figure which makes the back streets equal in width to the front streets, it is about £131, whereas the average cost in fifteen of the large towns is £179.

REFUSE DISPOSAL.

During the year 135,238 tons of refuse were disposed of; 46,784 tons were deposited on tips within the city, 27,815 tons sent to sea, 39,141 tons burnt at the destructors, and 21,498 tons sent by rail to various farms. Exclusive of trade refuse, the house refuse amounted to 88,415 tons, and is equivalent to 6·46 cwts. per head of the population, or 34·88 cwts. per house, the cost of removal and disposal being 20·36d. per head of the population, or 9s. 1·83d. per house. The street refuse amounted to 43,430 tons, and is equivalent to an average of 171 tons per mile of highway cleansed.

TOWN PLANNING.

In the two areas for which the Local Government Board have given sanction to prepare town planning schemes, negotiations, the city engineer states, have been continued with the adjoining local authorities and the owners of land, and preliminary plans are being prepared for two additional areas, which will embrace the whole of the remaining undeveloped land within the city.

TRAMWAYS.

The maintenance of the tramway permanent way cost £8,295, or £133 per mile; in addition to ordinary maintenance, £20,631 was expended in renewals, equivalent to £333 per mile, so that the total cost of the permanent way was £28,926, or £466 per mile. Mr. Steele points out that the annual total cost of maintaining the permanent way has now reached a high figure, adding that it is doubtful if it can be reduced for many years to come. The renewals on the quick-service routes are not only tedious, but costly, owing to the necessity for a large proportion of night work.

SALFORD BOROUGH SURVEYORSHIP.

Twelve candidates for the position of borough surveyor of Salford came before the corporation Finance Committee on Wednesday, and there were selected five whose qualifications will be further inquired into before the final appointment is made by a special sub-committee.

Manchester's New Main Sewer.—The Rivers Committee of the Manchester Corporation, who are charged with the care of the drainage arrangements of the city, have received reports that the work of constructing the new main sewer is progressing satisfactorily. The scheme is estimated to cost £1,000,000, and will require several years for its accomplishment.

Protection of Water Undertakings.—We received yesterday from Mr. F. C. Uren, surveyor to the urban district council, a letter with reference to a rumour which has been circulated to the effect that a German spy had been caught attempting to introduce typhoid cultures into the Aldershot camp and town water supplies. The rumour, Mr. Uren states, is without foundation.

DEVON COUNTY ROADS.

A RECONSTRUCTION SCHEME ESTIMATED TO COST £565,000.

The Devon County Council appointed recently a Special Main Roads Committee to consider the whole question of main roads, and especially whether a policy of reconstruction, based on a loan, would not be better and cheaper in many cases than the system of making repairs from year to year, as required. This course was adopted because it was generally felt that the main road problem was one which will entail a great expenditure if the principal arteries of traffic in the county are to be brought up to the high standard which seems to be the aim of the Road Board.

It is understood that before the Special Committee met each member received a memorandum, in which it was submitted that there were no fewer than 1,000 miles of main road in the county in urgent need of thorough treatment to make it capable of carrying modern traffic. One thousand miles at the estimated cost of £1,000 per mile would bring the cost up to £1,000,000. But from the first the Special Committee did not contemplate this great scheme, for, as the memorandum itself stated, "it is no use suggesting a loan on such a scale, although the expenditure of the sum or something like it will have to be incurred some day." Reasons why such a large scheme could not be undertaken immediately included the limit of the mileage which could be withdrawn from public use at any one time and the lack of sufficient labour and staff.

Information before the Special Committee showed that there are some 300 miles of the most important main roads incapable of sustaining without very costly outlay on repairs every year the heavy weights now being put upon them. The estimated cost of making these roads capable of bearing this traffic was about £565,000, to which was added £13,000 for an urgently required widening of one road. The recommendation resolved upon by the committee was that a loan should only be raised for work in respect of which long periods of repayment are allowed, other work for which short period loans only are granted being paid for out of revenue. The estimate was, therefore, divided as follows:—

Roads.	Total estimated cost.	Short loan percentage.	Long loan percentage.
Division 1 ..	£350,000	50	50
Division 2	174,000	45	55
Division 3.	41,000	40	60
	£565,000		

On this basis it will be seen that a loan of £259,000 is contemplated, subject, of course, to any grant which may be made by the Road Board. The committee decided to recommend to the county council that as far as possible loans should be raised for the reconstruction works in respect of which long loans would be granted, the money to be obtained in instalments and spread over a short period of years, and that not more shall be raised in any one year than can profitably be expended therein. They suggest that the county could probably borrow money at 3½ per cent interest, to which they add 2½ per cent as the probable sinking fund, making a total charge of 6 per cent. The committee cannot estimate the amount of the grant likely to be made by the Road Board, but they suggest that the loans raised by the council should not involve an annual charge upon the rates of more than 1½d. in the £.

The report was submitted to the meeting of the county council on September 25th, and received formally, the discussion being adjourned.

Glasgow Cleansing Department.—The annual report of the Glasgow superintendent of cleansing shows that during the year ended on May 31, 1914, the ordinary expenditure amounted to £181,726, which was an increase on the estimate of £11. The principal increases were in salaries and wages, £1,686, and in workshop materials, &c., £1,039. The revenue of the department, which was estimated at £43,300, amounted to £43,602, an increase of £302. The estimates for the year anticipated a nett cost of £138,415, but the actual result of the year's working shows the charge against assessment for general cleansing purposes to be £138,124, or a saving of £290. In the course of the twelve months 713 ashpits were replaced by 2,307 portable bins. The total amount of material collected was over 288,976 tons, or a daily average of 938 tons.

The Surveyor
And Municipal and County Engineer.

PRO PATRIA.

[FIFTH LIST.]

We present herewith a fifth list of municipal, engineering and sanitary officials who are taking part in the war, and shall be glad to hear of other cases within the knowledge of our readers.

Arthur, G. J. (Miss), education office, Ealing, Territorial Force Nursing Staff, Territorial Army.

Ashfield, L., town clerk's department, Ealing, 13th Kensington Battalion London Regiment, Territorial Army.

Baker, B., chief assistant, electricity department, Morecambe Town Council, 5th King's Own Royal Lancaster Regiment.

Baxter, N., junior clerk, surveyor's department, Morecambe Town Council, 5th King's Own Royal Lancaster Regiment.

Brown, T., junior clerk, accountant's department, Morecambe Town Council, 5th King's Own Royal Lancaster Regiment.

Budgett, W. H., assistant surveyor, Wood Green Urban District Council, Royal Naval Division, Engineer Units.

Cary, F. E., assistant, borough surveyor's department, Wandsworth, 1st London Divisional R.E., Territorials.

Cook, Albert, accounts department, Featherstone Urban District Council, with the "Pals" Battalion, Lincolnshire Regiment.

Cox, W., electric light department, Ealing, 8th Battalion Middlesex Regiment, Territorial Army.

Cozens, G., electric light department, Ealing, Royal Army Medical Corps, Territorial Army.

Cullen, C. O., electric light department, Ealing, Queen's Westminster Rifles, Territorial Army.

Davey, R., electric light department, Ealing, Royal Army Medical Corps, Territorial Army.

Davis, W. J., clerk to surveyor, Finchley Urban District Council, Herts Imperial Yeomanry.

Duffield, A. E., borough surveyor's department, Ealing, 8th Battalion Middlesex Regiment, Territorial Army.

Dunman, F. W., clerk, borough surveyor's department, Wandsworth, 5th East Surrey Regiment, Territorials.

Ficklin, A. H., borough surveyor's department, Ealing, 28th London (Artists' Rifles), Territorial Army.

Furber, R., education office, Ealing, 23rd Battalion of the London Regiment, Kitchener's Army.

Garrett, R., electric light department, Ealing, H.M.S. "Macedonia," Navy.

Glenn, A. J., education office, Ealing, 5th Battalion Seaforth Highlanders, Territorial Army.

Harland, N. L., clerk to public health department, Finchley Urban District Council, 4th East Anglian R.F.A. Ammunition Column.

Higgins, Thomas, assistant, borough surveyor's department, Leicester, Royal Naval Division, Engineers' Unit.

Holmes, C. N., clerk gas department, Morecambe Town Council, 5th King's Own Royal Lancaster Regiment.

Jackson, H. V., assistant, county surveyor's office, Peterborough, corporal, 3rd Battalion, Northamptonshire Regiment, Territorials, Weymouth.

King, H. J., assistant, engineer and surveyor's department, Ruislip-Northwood Urban District Council, 9th Battalion Middlesex Teritorials.

Lewis, L. O., second assistant, surveyor's department, Weybridge Urban District Council, R.A.M.C. Field Ambulance Detachment (Territorials). Has volunteered for foreign service.

Lissaman, A. J., engineering assistant, Finchley Urban District Council, University of London O.T.C.

Lister, G., road foreman, borough surveyor's department, Wandsworth, 2nd London Divisional R.E., Territorials.

McNaught, D., borough treasurer's department, Ealing, London Rifle Brigade, Kitchener's Army.

Manser, J. W., electric light department, Ealing, Duke of Cornwall's Light Infantry, Kitchener's Army.

Melhuish, H. W., engineering assistant, Finchley Urban District Council, 1st Home Counties R.F. Artillery.

Metcalf, F., clerk in rating department, Finchley Urban District Council, G Company, Kent Cyclists' Battalion.

Mortimer, W., chief clerk, electricity department, Morecambe Town Council, 5th King's Own Royal Lancaster Regiment.

Mulliner, P. C., clerk, borough surveyor's department, Wandsworth, 7th London Brigade R.F.A., Territorials.

Palmer, H. A., sanitary inspector, Wandsworth, 1st London Sanitary Company R.A.M.C., Territorials.

Peake, A. E., divisional surveyor and inspector, Essex County Council, with the Engineering Unit of the Royal Naval Division.

Potter, J., assistant, borough surveyor's department, Wandsworth, 1st London Divisional R.E., Territorials.

Roberts, William, surveyor's clerk, Featherstone Urban District Council, with the "Pals" Battalion, Lincolnshire Regiment.

Rogerson, W. A., divisional surveyor and inspector, Essex County Council, with the Engineering Unit of the Royal Naval Division.

Smart, Vincent, assistant engineer and surveyor's department, Cheshunt Urban District Council, 5th Battalion, East Kent Regiment (The Buffs).

Smith, Harold T. M., pupil, engineer's department, Southwick-on-Sea Urban District Council, 7th Durham Light Infantry.

Smith, J. H., town clerk's office, Morecambe, Sergeant, 2nd West Lancs R.F.A.

Templeman, P. L., education office, Ealing, Royal Field Artillery, Kitchener's Army.

Voice, H. Guy, assistant surveyor, East Grinstead Urban District Council, Second Lieutenant, Royal Lancaster Regiment.

Wallingford, A. C., county surveyor, Peterborough, Lieutenant, 4th East Anglian Royal Field Artillery, Territorials.

White, R., electric light department, Ealing, Royal Army Medical Corps, Territorial Army.

Wright, H. H., advertising manager, Morecambe Town Council, 5th King's Own Royal Lancaster Regiment.

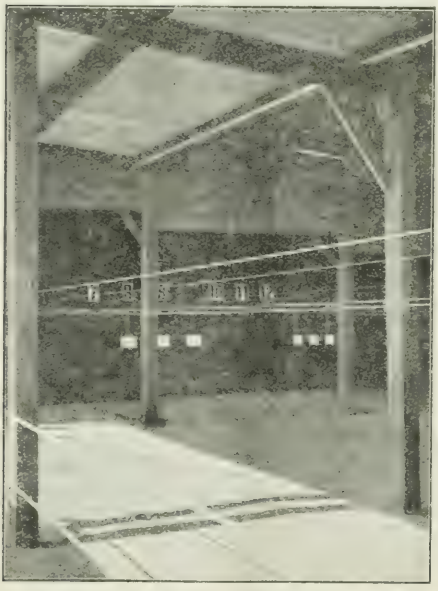
Mr. Reginald A. Dibdin, partner of Mr. W. J. Dibdin, the bacteriologist and chemist, and not, as stated in our issue of the 18th ult., Mr. L. A. Dibdin, the engineer to the Slate Bed Biological Sewage Disposal Company, Limited, has joined the 10th Battalion King's Royal Rifles (Kitchener's Army), and Mr. F. J. A. Dibdin, partner of Mr. L. A. Dibdin in the firm of Messrs. Dibdin & Dibdin, sanitary engineers, is a Lieutenant in the 3rd Battalion Royal Sussex Regiment (Regular Army).

CHISWICK RIFLE RANGE.

We [illegible] the opening of a miniature rifle range which has been constructed at the expense of the Chiswick Chamber of Commerce for the use of ratepayers of that district.

The accompanying photographic views, which we are enabled to reproduce by the courtesy of Mr. Edward Willis, ASSOC.M.INST.C.E., engineer to the district council, who acted as honorary surveyor for the work and prepared the necessary scheme, will serve to illustrate the working of the range. As we stated last week, the building, which is roofed over in order that shooting can proceed all the year round, contains twelve targets. These are movable in sets of three. Ample space is provided at the firing platform, and the range length is 25 yds. Special provision is made, by means of 2-ft. grooved wheels, acting on a continuous cord attached to the target supports, for easily bringing the targets to the firing point for examination or removal. The supports are light wooden framework hung to galvanised iron wire by means of pulleys, and the whole apparatus is both simple, quick, and effective.

CHISWICK RIFLE RANGE: VIEW OF FIRING PLATFORM, SHOWING APPARATUS FOR MOVING TARGETS.



VIEW OF STOP BUTT, SHOWING MOVING TARGETS, DEFLECTION PLATES, &C.

LOWER THAMES VALLEY DISTRICT SURVEYORS' ASSOCIATION.

The annual meeting of the above association took place at Twickenham on Saturday, the 3rd inst., when a fair number of members attended.

The following were unanimously elected as officers for the ensuing session: -

President: J. W. Croxford, engineer and surveyor, Brentford Urban District Council.

Vice-president: R. H. Jeffes, engineer and surveyor, Maldens and Coombe Urban District Council.

Hon. Secretary and Treasurer: J. G. Carey, engineer and surveyor, Heston and Isleworth Urban District Council.

Hon. Auditors: J. Webb, engineer and surveyor, Hendon Urban District Council; R. W. Hindhaugh, engineer and surveyor, Ham Urban District Council.

The retiring officers were warmly thanked for their efforts on behalf of the association during the past year. The hon. secretary presented a report of the work done, and pointed out that the association was in a very healthy condition. Several papers of a most interesting and instructive nature had been read. All of these were of a high order, and had created a good discussion. Among other matters, the question of superannuation had received much attention, and promises of support to the Bill promoted by the National Association of Local Government Officers had been obtained from several Members of Parliament.

The auditors' report showed the finances of the association to be in a satisfactory condition. The programme for the ensuing session was left in the hands of the president and hon. secretary. A discussion was opened on the question of contracts, more particularly the items referring to variations, &c.; also on pumping plant and screening of sewage.

Association of Engineers-in-Charge.—"The British Empire, and Our Work in It," is the subject of the presidential address which Mr. Frank Bailey, M.INST.C.E., will deliver before the members of this body on Wednesday, October 14th, at St. Bride's Institute, E.C. Dr. R. T. Glazebrook, the retiring president, will take the chair at 8 p.m.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions.

425. Strength of Materials.—Explain why the resistance of a long strut depends more on the stiffness of the material than on its strength.

426. Geodesy.—Give a formula for computing the difference in height between two stations by means of the observed heights of the barometer, and state the meanings of the symbols used.

427. Testing Drains.—What tests should be applied to house drains before being passed? Describe any appliances used.

429. Mechanics.—A pair of blocks have three sheaves in the upper and two in the lower block. Find the pull required to raise ½ ton, assuming ⅓ of the energy wasted.

430. Materials.—In what respects do Portland and Roman cements differ, and in what circumstances is the latter used? ("Beginner.")

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

424. Mechanics.—Distinguish between kinetic and potential energy, and show how they are measured in the case of a body falling from rest. Show that, if a body be let fall from rest, its energy remains constant till it reaches the ground.

Kinetic energy is the energy which a body possesses by virtue of its motion, and it possesses this energy until it is destroyed by the external forces (such as friction, the resistance of the air, and so on) which are always acting on it. A common example of kinetic energy is an express train travelling at a high rate of speed by reason of its momentum after steam has been shut off. The neutralisation of its kinetic energy by the forces enumerated above causes the train to come to rest.

Potential energy is the energy which a body possesses by virtue of its position, which is best described as an abnormal one. For instance, a watch-spring in uncoiling does work, and it is therefore a type of potential energy.

In the case of a body falling from rest the kinetic energy is measured as follows:—

Let a body of weight W lb. be moving at a velocity of V feet per second, and let it move through a distance of S feet before coming to rest. Let f be the retardation;

then $V^2 = 2fS \quad \therefore S = \frac{V^2}{2f}$

As in Newton's Second Law of Motion, $F = Wf$

and kinetic energy = work done in coming to rest

= Work done by a force F in moving S feet

$= F.S. = \frac{WfS}{g} = \frac{WfV^2}{g \cdot 2f} = \frac{WV^2}{2g}$ foot lb.

Now, considering potential energy, it is obvious from the principle of work that where W = weight and h = vertical distance it is raised from some standard position, work done = (Wh) ft.-lb., and that the body is capable of doing (Wh) ft.-lb. of work—*i.e.*, that its potential energy = (Wh) ft.-lb. of work.

The above arguments are perfectly clear in the case of a body falling from rest. We can now prove that in this case the sum of kinetic and potential energies is constant. Let H be the point from which the body is let fall, and O be the point at which it reaches the ground. Let the body be of weight W, and let h be its original height above the ground. At H its potential energy is the work it can do from H to O—that is, Wh ft.-lb. At H the body has no motion, therefore its kinetic energy is zero; so that the sum of its energies at H is (Wh) ft.-lb.

Again, at O its potential energy is zero, and its velocity is V. Therefore its kinetic energy at O is

$$\frac{WV^2}{2g} = \left(\frac{W}{2} 2g\right) \text{ (W}h\text{) ft.-lb.}$$

so that the sum of its energies at O is (Wh) ft.-lb.

Now let P be any point where HP = x.

At P we have potential energy = W . OP = W($h-x$), and kinetic energy

$$\frac{WV_1^2}{2g} \text{ (where } V_1^2 = 2g \text{ HP} = 2gx\text{)}.$$

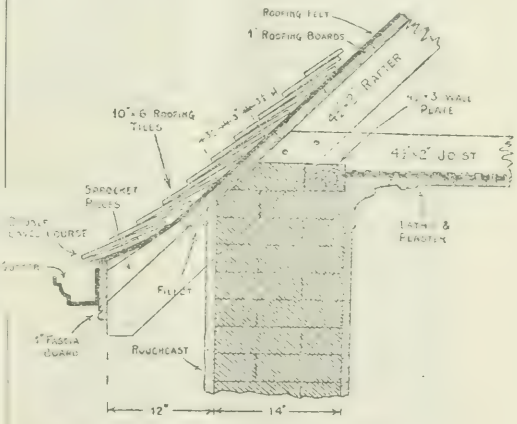
Therefore kinetic energy =

$$\frac{W}{2g} 2gx = Wx \text{ ft.-lb.}$$

Therefore sum of energies at any point P = W($h-x$) + Wx = (Wh) ft.-lb. Hence the total energy remains constant till the body reaches the ground. (B. K., *Hayes.*)

428. Building Construction.—Draw a section through the eaves of a tiled roof, 45 deg. pitch, on a 14-in. wall. Show all details, including laths, sprockets and guttering.

The following drawing is submitted in answer to this question:—



Section through Eaves of a Tiled Roof.

Chartered Surveyors' Golfing Society.—Owing to the war, it has been decided to cancel the meetings fixed for October 7th (Croham Hurst) and October 14th (Birmingham) and also the annual dinner.—The result of the Summer Tournament is as follows: Winner, O. B. Pearse; runner-up, S. F. Monier Williams; semi-finalists, A. Goddard and M. M. Webb. The result of the Northern and Scotch Tournament is as follows: Winner, S. Addison Smith; runner-up, R. G. Kirkby. The Running Quarterly Bogey Competition for the quarter ending September 29th was won jointly by W. Jennens Hackett and R. G. Kirkby, each with a card of 4 up.—The Running Quarterly Bogey Competitions will be discontinued until further notice.—The annual general meeting will be held at the Surveyors' Institution, 12 Great George-street, S.W., on Wednesday, November 11th, at 5.30 o'clock.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Now that we are [illegible] accept the German [illegible] to hold the next International Road Congress at Munich, would it not be well to ask the Russian Government to grant us an invitation to hold it at Berlin, as the Servian Government might ask us to hold it at Belgrade? Could not the Permanent Committee also ask the Kaiser if he would be good enough, if he could spare the time, to submit to the congress a paper with some such title as "Obstructions on the Road to Paris"?

• • • •

It is [illegible] to be regretted that there are [illegible] two sides to every question? Is it not [illegible] considered that female employment at good wages is an excellent thing for the country? But is it a fact in connection with this that there is a certain large town in Scotland where women are very largely employed at high wages, with the result that there are more "corner men" to be seen than in almost any other town in the United Kingdom, and that these young and apparently active men are leading such happy, lazy lives that they will not enlist? What about the well-known poem which [illegible] "Men must work and women must weep"?

• • • •

Is not the statement very true that it is an ill wind that blows nobody any good? Does not this apply to the manufacturers of commercial motor vehicles, who we hear are busier than ever and their shops working day and night making motor lorries and other similar vehicles for the Government? Is it not found that in modern warfare it is essential to have this class of vehicle in large numbers for the purpose of conveying food and ammunition to the Front?

• • • •

Should not everyone read the excellent and instructive article in *Education* of the 2nd inst. on "Why Did We Go to War," by the Right Hon. Joseph A. Pease, M.P., who clearly explains the whole circumstances in a lucid and concise manner? Could anything be better than the following passage: "We are helping for the independence of Belgium against the domination of a great military Power: we stand for the freedom of nations and the sanctity of treaties against militarism and military aggression"? Could we not say after reading this article that we are fighting for an "Honourable Pease"?

• • • •

When are we likely to hear the results of the trials which have been made of the road testing machine at the National Physical Laboratory? This machine, which has now been at work for several months, was expected to solve many problems of road wear, and especially that of the cause of waves on the surface. Has it done this: and whose duty is it to publish the results?

• • • •

Is it a fact that the roads in Russia are so bad that the Czar's troops are already experiencing considerable difficulty in making their way to the Front? Would it not be a good move if an English road engineer of experience were employed by the Russian Government to proceed there at once in order to advise them as to what should be done to place these roads in a good condition and thus make them passable in the hour of need?

• • • •

When may we expect the London County Council to issue their long-promised "Reinforced Concrete Regulations"? May we not expect them to be as near perfection as possible when they are issued, for have they not been subjected to rigorous criticism and amendment by the Local Government Board and by the experts of the Concrete Institute? Is there not always some danger of cast-iron regulations with regard to new methods of construction, tending to cripple improvements and experiments in fresh directions if the rules are too rigid and without sufficient elasticity to meet such cases?

• • • •

Apropos of a point raised by an inspector at a recent Local Government Board inquiry at York with reference to the disadvantage of asking long periods for repayment of loans, was not the inspector quite right in pointing out that the longer the period the greater the cost to the ratepayers? Does not a simple calculation show that if £100 is borrowed at 4 per cent for ten years it will cost £123 5s. 10d., whereas if it is borrowed for forty years the cost will be £202 1s. 8d., and should not local authorities realise this when asking to borrow money for the longest possible period"?

INSTITUTION OF MUNICIPAL ENGINEERS.

COUNCIL MEETING.

At a meeting of the council held in London on September 30th the following applicants were recommended for admission:

To Membership.—Messrs. E. T. Fox, deputy and acting surveyor, Alnwick Urban District Council; R. A. Pereira, acting district board engineer, Godavari, India; W. Gunn, shire engineer, Surat, Queensland; C. D. Hardy, shire engineer, Gilgandra, N.S.W.; R. D. Speed, shire engineer, Ararat, Victoria; St. Eloy D'Alton, shire engineer, Dimboola, Victoria; J. Sands, town engineer, Wynnum, Queensland; and T. L. Thompson, shire engineer, Harwood, and engineer, Maclean Corporation, Queensland.

To Associate-membership: Messrs. M. Wahby, King's College, Strand, W.C., and J. R. Jussawalla, executive engineer's department, Bombay Municipality.

Transfer to Membership: Mr. C. A. Trimm, chief surveyor and engineer, Co-partnership Tenants.

Transfer to Associate-membership: Mr. F. A. W. Clarke, county surveyor's office, East Suffolk.

(Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days.)

Elected to Studentship: Mr. F. S. Nixon, surveyor's office, Bedale Rural District Council.

New Members, &c.—From the applicants recommended for admission at the last meeting twelve members and four associate-members were elected.

Public Health Acts (Building By-laws) Amendment Bill.—The text of this Bill is being considered by the General Purposes Committee, who will report at the next meeting of the council.

Departmental Committee on Building By-laws.—This committee is prepared to receive evidence from the institution. The committee has been appointed to inquire into the working of the building by-laws, and it has been decided, as a preliminary, that the institution submit to the committee a memorandum embodying shortly its views. Members are requested therefore to let the secretary have any suggestions they may have to make as to present codes of by-laws, their working and administration, and so forth, and these suggestions will then be dealt with by a special committee of the institution that has been appointed to prepare the memorandum.

N.A.L.G.O. Battalion. — The resolution of the N.A.L.G.O. of September 9th, that a battalion be recruited from members of the National Association for service during the war, was before the council, who are of opinion that, as there are many assistants able to leave their official duties who might desire to avail themselves of the opportunity, the matter should be brought to the notice of the members of the institution.

Delegates to N.A.L.G.O.—Messrs. Latham, Pegge and Stickland were reappointed institution delegates to the National Association.

The next meeting of the council will be held in London on Wednesday, October 28th.

The annual general meeting will be held in London in November on a day to be arranged.

York Town Planning Scheme.—Mr. George L. Pepler, Local Government Board inspector, held an inquiry on Tuesday at York into the application of the corporation to prepare a town planning scheme with reference to an area situate partly within the city and partly within the rural districts of Escrick and Flaxton. The scheme comprises three different areas, 1,806 acres in Hull-road, 543 acres in the Burton Stone-lane, and 515 acres in the New Earswick suburban districts. In regard to the Flaxton rural district, the rural council have joined with York in town planning.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

INQUIRIES HELD.

Bradford T.C. (September 29th. Mr. M. K. North).—£2,500 and £5,000 respectively for recreation grounds at Knowles-lane, Dudley Hill, Legrams-lane and Northside-road, Lidget Green, and for bowling greens at Girlington and Eccleshill recreation grounds. The necessary details were submitted by the corporation officials.

Clayton West U.D.C. (September 23rd. Mr. R. G. Hetherington).—£5,739 for a sewerage and sewage disposal scheme. It was stated that the council had already spent sums approaching £1,000 out of current rates on account of sewerage improvements in anticipation of and on account of the proposed scheme.

Exeter T.C. (October 5th. Mr. W. O. E. Meade-King). £4,100 for the widening and improvement of Haven-road and Water-lane.—The town clerk, Mr. H. Lloyd Parry, and the city surveyor, Mr. T. Moulding, stated that Haven-road was the only vehicular approach to the canal wharf, to the corporation electricity works, the Exeter gasworks, timber yards, a fish-curing factory, and other works, while Water-lane was the approach to various factories and the city refuse depot.

Grimsby R.D.C. (September 24th. Mr. W. O. E. Meade-King).—£4,990 for the widening and improvement of King's-road, Immingham.—The surveyor, Mr. Hobson, gave details of the proposed scheme. It was explained to the inspector that it was essential that King's-road, which was the main road from Habrough Station and Immingham to the docks should be improved. At present it was only a very narrow road, about 26 ft. to 30 ft. wide, and the proposed width was 50 ft.

Sheffield T.C. (October 1st. Mr. F. O. Stanford). £10,342, the cost of sewerage work which is to be carried out, mainly with a view to providing work for the unemployed.—It is proposed to lay an extension to Stannington, and to substitute modern sewers for the present rubble drains in Earl Marshal-road, Heeley Bank-road, Norwood-road, and Whirlowdale-road. The corporation annually spends about £25,000 in the reconstruction of rubble sewers. The substitutions now proposed are in addition to the ordinary programme. The town clerk, Mr. W. E. Hart, and the surveyor of highways, Mr. W. J. Hadfield, gave evidence. Sanction was also asked for a loan of £2,290 for the widening and improvement of part of Meadow Hall road, and £2,088 for public conveniences.

Wem R.D.C. (September 15th. Mr. R. H. Bicknell).—£3,194 for the proposed new Smithfield.—It was stated that the sum asked for could be borrowed at 4 per cent, and as the income was estimated at £160, it was calculated that there would be a profit of £37.

Willesden U.D.C. (September 24th. Mr. M. K. North).—£2,617 for works of private street improvement in Gresham, Woodheyes and Bridge roads. Evidence was submitted by Mr. O. Claude Robson, the council's engineer, and Mr. Reginald C. Graves, the deputy clerk.

APPLICATIONS FOR LOANS.

Antrim R.D.C.—£10,768 for the erection of cottages.

Armagh U.D.C.—£1,000 for the enlargement of the reservoir.

Bromley T.C.—£666 for private street works.

Burgess Hill U.D.C.—£600 for road and park improvements.

Bury T.C.—£4,000 for road improvements.

Crick R.D.C.—£1,200 for a housing scheme.

Finchley U.D.C.—£26,550 for workmen's houses.

Lancaster T.C.—£4,304 for road construction.

Leyton U.D.C.—£3,500 for a circular tank at the sewage works.

Littlehampton U.D.C.—£200 for the purchase of land for hospital extension.

Mirfield U.D.C.—£2,421 for the purposes of road improvement and depots.

Paignton U.D.C.—£700 for works of sewerage.

Pontypool U.D.C.—£4,000 for the provision of a public slaughterhouse.

Ramsgate T.C.—£526 for road widening.

Rotherham R.D.C.—£325 for water supply works.

Willesden U.D.C.—£6,799 for wood paving, £8,539 for road improvement, and £23,143 for road widening.

Worcester T.C.—£3,400 for the St. Martin's Gate improvement.

LOANS SANCTIONED.

Barry U.D.C.—£6,900 for the erection of twenty-four workmen's houses.

Bridlington T.C.—£600 for the purchase of land in the vicinity of the waterworks.

Bromley T.C.—£13,677 for wood block paving.

Cheltenham T.C.—£6,497 in respect of municipal offices.

Darlington T.C.—£24,000 for the purposes of street improvement, and £4,170 for a water-tube boiler and a cooling tower at the electricity works.

Daventry R.D.C.—£1,626 for the erection of eight houses.

Dewsbury T.C. £9,071 for gasworks plant, and £580 for sewerage works.

Gwyrfai R.D.C.—£6,977 for workmen's dwellings.

Hinckley R.D.C.—£1,400 for water supply extension.

Ilford U.D.C. £8,750, the amount in excess of the original estimate of £27,500 for road improvement.

Knaresborough R.D.C. £260 for water supply works.

Spalding R.D.C. £1,385 for the erection of workmen's houses.

Teignmouth U.D.C. £672 for a motor fire engine.

Torquay T.C.—£850 for road improvement.

Wrexham T.C. £3,025 for electrical plant.

FORTHCOMING INQUIRIES.

	OCTOBER.	£

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important proposed works of which particulars appear below: Buildings—Devon, Nottingham, £15,000; Stepney, housing and town planning—Liverpool, roads and materials—Barrowford, £2,200; Lewisham, Marylebone, Newcastle, £9,000; Wandsworth, £30,000; water, &c.—Bedwellty, Cardiff, Glasgow. Particulars of other proposed works will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Derby T.C.—A tender, at £5,547, has been accepted for additions to the free library and art gallery.

Devon C.C.—It was recently reported that the architect, Mr. Morris, was preparing alternative plans for the proposed technical school at Torquay.

Eastbourne T.C.—The Local Government Board have approved the council's tuberculosis hospital under the National Insurance Act, 1911, for the treatment of tuberculosis.

Erpingham R.D.C.—Arrangements have been completed by this council for the extension of the isolation hospital, and the matter is to be considered by the Sheringham Urban District Council, who are also concerned in the scheme.

Herne Bay U.D.C.—The tender of the Limmer Asphalte Company, at £275, has been accepted for asphalting the roof of King's Hall.

Ilfracombe U.D.C.—The council have referred to a special meeting a report of the surveyor, Mr. O. M. Prouse, on the suggested alteration of the public slaughter-house, so as to enable it to be used by all the butchers in the town. Mr. Prouse estimated the cost at £57.

Kingston (Surrey) T.C.—The tender of Messrs. Limpus & Son, at £200, has been accepted for providing and laying a removable flooring at the swimming bath.

Manchester T.C.—With regard to the Hulme Barracks site, the Parks Committee have decided to utilise the riding school as a covered playground for children, and in the centre of the square a couple of bowling greens will be laid out for the use of residents in the district. The most important scheme, however, is the proposed construction of an open-air bath 100 ft. in length.

Nottingham T.C.—The Carnegie trustees, having offered to give £15,000 to cover the cost of building, the corporation have decided to proceed with the erection of four new branch libraries and reading-rooms.

Stepney B.C.—The Finance and Parliamentary Committee have given instructions for notice to be served on the Mercers' Company of the council's intention to exercise the option of purchase of a site in Arbour-square, E., belonging to the company, upon which to erect new municipal buildings.

HOUSING AND TOWN PLANNING.

Bridlington T.C.—Tenders have been accepted, at £1,652, for the erection of workmen's houses off Quay-road.

Holsworthy U.D.C.—It has been agreed to complete the purchase for £200 of a meadow for the purpose of erecting five workmen's cottages.

Liverpool T.C.—The Housing Committee have accepted tenders for the erection of self-contained houses in Sparling-street, and tenements in Gore-street and Gordon-street, to rehouse the dispossessed in those areas. By pressing forward its rehousing schemes, the committee hope to assist men in the building trades to tide over the period of comparative unemployment.

Wrexham R.D.C.—Tenders have been provisionally accepted for the erection of twenty-two houses, at a cost of £3,945. A tender at £760 has also been accepted for the construction of the streets in connection with the scheme.

PARKS AND OPEN SPACES.

Edinburgh T.C.—It was stated recently at the meeting of the Public Parks Committee that a considerable amount of work could, in the event of unemployment, be put in hand. This would take the form of opening and laying out of new roads, improvement of cricket pitches and golf courses.

REFUSE COLLECTION AND DISPOSAL.

Hove T.C.—It has been agreed to erect additional refuse crushers on land at the Leighton-road electricity works.

Marylebone B.C.—The offer of the Western Cartage Company to extend the contract for the removal of house refuse in the borough for one year as from March 31, 1915, at the sum of £12,495, has been accepted.

ROADS AND MATERIALS.

Banffshire C.C.—The County Road Board have by resolution agreed to support the Lecht road scheme.

Barrowford U.D.C.—The council have approved the plans of the surveyor, Mr. F. Sutcliffe, for making up a number of streets, at an estimated cost of £2,200.

Bristol T.C.—The city engineer, Mr. L. S. McKenzie, has received instructions to negotiate for the purchase of property required for the widening of Stoke-road.

Burgess Hill U.D.C.—The council have agreed to the plans of the surveyor, Mr. Edwin Brown, for the widening of part of Church-road, and improvements at St. John's Park, at an estimated cost of £600.

Castlereagh R.D.C.—It is proposed to carry out tarring on the main roads at an estimated cost of £250.

Clitheroe R.D.C.—The surveyor, Mr. J. R. Taylor, has prepared a scheme for a new road to obviate the dangerous corners on the road leading from Chatburn Railway Station to Worston. The estimated cost is £900, towards which contributions of £600 are expected.

Eastbourne T.C.—Some of the roads on the proposed sites for workmen's dwellings are 20 ft. wide only, whereas the width required by the by-laws is 36 ft., and a letter was read from the Local Government Board suggesting that the by-laws should be amended so as to allow of the reduced width. The town clerk has been instructed to draft an amending by-law accordingly.

East Grinstead R.D.C.—The council have agreed to allow the London Granite Company to substitute "Penmaenmawr" for "Quenast" granite owing to the impossibility of procuring the latter from the quarries in Belgium.

Erith U.D.C.—It has been agreed to contribute £1,000 towards the scheme for the construction of the proposed new road from Erith to Dartford.

Lewisham B.C.—The following schemes prepared by the borough surveyor, Mr. E. Van Putten, have been submitted to the Road Board: Improvement, Burnt Ash-lane by borough boundary next Bromley, £2,513; improvement, Perry-hill, £2,863; Brownhill-road, wood paving, £13,689; Catford-hill, wood paving, £5,680; Sangley-road, wood paving, £5,400; Sandhurst-road, from Sangley-road to Muirkirk-road, wood paving, £411; Eltham-road and Lee Green, wood paving, £1,448; Sandhurst-road, from Muirkirk-road to Torridon-road, tar-macadam, £1,590; St. Mildred's-road, from Birch-grove to Baring-road, £666.

Marylebone B.C.—In response to a request for suggestions, it was proposed to the Road Board that the paving of a portion of Albert-road with wood might usefully be carried out, and it is understood that the board is prepared to make a grant for the cost of this work—viz., about £6,000—in the event of distress arising. The grant is conditional on the whole of the repaving work already sanctioned and included in the estimates being carried out during the present financial year.

New Forest R.D.C.—A letter has been received from the county council, in reply to one from the district council, stating that it was intended to tarmac the main road from the junction with the borough county of Southampton to Lyndhurst.

Newmarket R.D.C.—Several road improvements are to be carried out for the better movement of troops, the cost being estimated at between £8,000 and £9,000.

the Road Board will bear the whole cost of a new length of road, and contribute 75 per cent towards the cost of the other works.

Norfolk C.C.—It has been agreed to pay the contractors for 10,000 tons of granite an extra rate of 9d. per ton, Lloyd's rate for war insurance. The county surveyor, Mr. T. H. B. Heslop, stated that the granite came from two supplies, Northumberland and Guernsey.

Nottingham T.C. Land costing £627 is to be purchased for the widening of Thorneywood-lane.

Strood R.D.C.—The surveyor, Mr. L. Randerson, has submitted proposals for widening and improving roads at various parts of the district, in the case of its becoming necessary to find work for unemployed.

Swansea T.C.—A grant has been obtained from the Road Board of nearly £7,000 towards the cost of widening Mumbles-road.

Tottenham U.D.C.—The engineer, Mr. W. H. Prescott, has submitted a report stating that the London Traffic Branch of the Board of Trade have approved the formation of a proposed new arterial road at a point midway between the gasworks and Park Station, and that until that authority have come to a final decision it is not possible for any action to be taken in connection with the proposed scheme. In any event Parliamentary powers must be obtained to form the road across the Marshes and the 25 acres on the east side of the river Lea, as these lands have been acquired for recreation purposes only.

Wandsworth B.C.—A wood paving scheme, estimated to cost £30,000, is to be carried out with the aid of a Road Board grant.

Worcester T.C.—The Streets Committee recommend the council to make considerable purchases of property for the St. Martin's Gate improvement scheme.

SEWERAGE AND SEWAGE DISPOSAL.

Bristol T.C.—The council last week agreed to the recommendation of the Sanitary Committee to construct new sewers in the Meg Thatcher's Green district, at an estimated cost of £1,660.

Clitheroe R.D.C.—The sewerage works at Wiswell have been completed satisfactorily, with a saving of nearly £100 on the contract.

Leicester T.C.—The Highways and Sewerage Committee have submitted to the council schemes of sewerage and storm-water drainage with a view to the utilisation of surplus labour through unemployment. The estimated aggregate cost of the works is about £7,200.

Worthing T.C.—An agreement has been reached with the Steyning West Rural District Council to receive the sewage of the whole of the parish of Lancing and a small portion of the parish of Findon at Cokeham.

WATER, GAS, AND ELECTRICITY.

Cardiff T.C.—The Finance Committee recommend the council to apply to the Local Government Board for permission to borrow £14,000 for the waterworks department—viz., £10,000 for mains, £3,000 for new services, and £1,000 for meters.

Glasgow T.C.—Since the rejection of the Lochs Voil and Doine water supply scheme by the House of Lords' Committee the corporation have been prospecting for other possible sources of supply. Investigations were made by the engineer (Mr. Sutherland) with Mr. E. P. Hill, consulting engineer, London, and a report was presented embodying the results of their inquiries with regard to the various sources of supply north and south of the city suggested by the opponents to the Loch Voil scheme. In the result the city council last week resolved that a Provisional Order be promoted for the utilisation of the water of the river Turk and for the conveying of the water to Loch Katrine. The river Turk, which lies to the east of the Trossachs Hotel, flows through Glenfinlas into Loch Vennacher. It is estimated that the scheme will yield an addition of 15,000,000 gallons per day to the city's supply. Calculating the increase of consumption at 1,000,000 gallons per day and taking into account a supply of 15,000,000 gallons from Loch Arklet, the water resources of the city would thus be sufficient to meet the demands of the next thirty years.

Hinckley R.D.C.—It has been decided to proceed with the Burbage water scheme, and in connection with the work the council have accepted the tender of the Stanton Ironworks Company, at £1,486, for pipes, and Messrs. Hamilton, Woods & Co., at £251, for valves and hydrants.

Hove T.C. — The General Purposes Committee recommend the corporation to carry on the electricity undertaking as a complete municipal trading concern. The undertaking was acquired from a company which has carried on the business for twenty-one years under a lease of the council.

Machynlleth U.D.C.—The Local Government Board recently wrote urging the council to augment the water supply so that a constant service might be provided, but it was decided that no action be taken.

PERSONAL.

Mr. W. A. Lavender, of Herne Bay, has been appointed temporary surveyor and inspector to the Swaffham Rural District Council.

Mr. P. B. Conway has been appointed, under the Mayo County Council, assistant county surveyor for the Belmullet and Killala rural districts.

Mr. Dennis V. Howard, of Chesham, has been appointed borough surveyor and inspector of Okehampton, at a salary of £85, rising to £100.

Mr. E. W. Vallis, an assistant surveyor to the Langport Rural District Council, has been appointed assistant surveyor to the Frome Urban District Council.

Mr. R. S. Henshaw, surveyor and water engineer to the Portland Urban District Council, has been appointed surveyor to the Wellingborough Urban District Council.

Mr. H. Heather, of the surveyor's department, Winchester Rural District Council, has been appointed assistant surveyor to the Hartley Wintney Rural District Council.

Mr. H. L. Richardson, surveyor to the Martley Rural District Council, has had his salary increased by £45 for one quarter only, to enable him to purchase a new motor cycle.

Mr. George Nicholas Yourdi, of Ditton Dene, Surbiton, resident engineer of the Elan Valley waterworks, 1893-1907, who died on September 4th, aged sixty-four, left £17,638 gross.

Mr. O. Hilton, second assistant in the surveyor's department, Watford Urban District Council, has been appointed second assistant surveyor to the Heston and Isleworth Urban District Council.

Mr. A. H. Brain, who for seven years has been deputy surveyor and sanitary inspector to the Kingswood Urban Council, has been appointed surveyor of the Hursley Rural District Council, Hants, out of 263 applicants.

Mr. Roy B. Herd, STUD.I.M. AND C.E., who was the junior assistant to the borough engineer of Newport, and who served his articles with Mr. W. J. Newton, ASSOC.M.INST.C.E., borough engineer of Accrington, has been appointed chief assistant to the borough engineer of Morley, Yorks. He will commence his new duties on the 12th inst.

Mr. Thomas Ashby, who was road foreman to the Hampton Urban District Council, but on Monday took up his new position as assistant superintendent of roads at Willesden, has been the recipient from his late confrères of a 400-day clock and a biscuit barrel bearing appropriate inscriptions. The presentation was made by Mr. S. Chambers, the Hampton surveyor, who referred to Mr. Ashby's ten years of harmonious work with all concerned with him.

Mr. E. H. Crump, surveyor and waterworks engineer to the Hinckley Urban District Council, a portrait of whom appears on another page of this issue, has held his present appointment since 1903. He was articled to Mr. Joseph Hall, then borough engineer of Cheltenham, and afterwards served for several years as assistant in his department. He subsequently became an assistant to Mr. J. S. Pickering, the latter then being borough engineer of Nuneaton. Mr. Crump is an associate-member of the Institution of Civil Engineers, a fellow of the Surveyors' Institution, and a member of the Institutions of Municipal and County Engineers, Water Engineers and Royal Sanitary Institute. At Hinckley he has carried out new sewage disposal works, public baths, new waterworks, water

schemes for the parishes of Burwell, Earl Shilton and Barlestone, and a new main outfall sewer, among other undertakings.

Mr. S. Evans, county surveyor of Flintshire, had some gratifying references made to himself at the meeting recently of the Flintshire County Council. Mr. Hugh Peel, as the chairman for four years of the Main Roads Committee which, under the new system of committees, now ceases to exist, spoke highly of the excellence of the work achieved by the county surveyor, and moved that he be congratulated. This was seconded by the chairman, Mr. F. J. Gamlin, who said that there had been some likelihood that Mr. Evans would go elsewhere. Speaking purely from a selfish point of view, he was pleased that Mr. Evans did not obtain the appointment for which he had been a candidate, and he hoped that the county surveyor would still remain with them for many years to come. Mr. J. E. Buckley Jones, supporting, said that the county roads were now a credit to the county council. The motion was carried unanimously.

FOR OTHER ADVERTISEMENTS

See End of Paper.

DORSET COUNTY COUNCIL.

MAIN ROADS AND BRIDGES DEPARTMENT.

ASSISTANT SURVEYOR.

Wanted, a Temporary Assistant Surveyor for the South District of the County, and to act generally under the direction of the Acting County Surveyor in the work of the Department, both on the roads and in office work.

The person appointed must devote his whole time to the work, and take up his duties as soon as possible.

Salary at the rate of £150 per annum, with an allowance of 1½d. per mile for travelling and other out-of-pocket expenses, except offices, postages and stationery, which will be provided.

All applications to be made on an official Form in candidate's own handwriting, and sent in, endorsed "Assistant Surveyor," with copies of not more than three recent testimonials, not later than Saturday, 24th October, 1914.

Forms of application and further particulars may be had from the undersigned.

E. ARCHDALL FFOOKS,
Clerk of the County Council.

County Offices,
Dorchester.
October 7, 1914. (1,991)

EAST AND WEST MOLESEY URBAN DISTRICT COUNCIL.

SURVEYOR'S DEPARTMENT.

Surveyor's Temporary Assistant required to fill position of one proposing going on active service.

Salary £80 per annum.

Preference given to one holding similar position.

Apply, with full particulars of experience, &c., before the 17th, to

J. STEVENSON,
Surveyor.

Council Offices,
East Molesey, S.W.
October 7, 1914. (1,990)

METROPOLITAN BOROUGH OF GREENWICH.

TUBERCULOSIS DISPENSARY.

TO BUILDERS AND CONTRACTORS.

The Council of the Metropolitan Borough of Greenwich is prepared to receive Tenders for the Erection of a Tuberculosis Dispensary at Maze Hill, Greenwich, according to the Drawings, Specification and Conditions of Contract, which may be seen at the Office of the Architect, Mr. Alfred Roberts, F.R.I.B.A., 92 London-street, Greenwich, on and after Tuesday, 13th October instant, between the hours of 10 a.m. and 4 p.m. (on Saturday between 10 and 12). Those desirous of tendering may obtain copies of the Drawings and Specification from the Town Clerk, Town Hall, Greenwich-road, between the above-mentioned times, upon payment of a deposit of Two Guineas, which will be returned to persons sending in a *bonâ-fide* Tender.

Tenders, on the Form to be supplied, sealed up and endorsed "Tender for Dispensary," must be delivered to the Town Clerk not later than 10 a.m. on Monday, 2nd November, 1914.

Tenderers will be required to sign a declaration that they pay such wages and observe such conditions as are considered fair in their trades.

The lowest or any Tender will not necessarily be accepted.

The Council reserve the right before a Tender is accepted of requiring the Tenderer to satisfy them or their Architect as to the nature and quality of work previously carried out by him.

FRANCIS ROBINSON,
Town Clerk.

Town Hall, Greenwich, S.E.
October 8, 1914. (1,992)

MANCHESTER CORPORATION.

The Rivers Committee invite Tenders for the construction of Main Drainage Work No. 8 (4), (East Didsbury Intercepting Sewer).

Plans may be seen, and Specification, Bills of Quantities and Forms of Tender obtained, on application at the City Surveyor's Office, Town Hall, Manchester, on payment to the City Treasurer of the sum of £10 10s., which sum will, after the Corporation have come to a decision upon the Tenders received, but not before, be returned to the person submitting a *bonâ-fide* Tender.

All cheques and postal orders are to be made payable to the order of the "Corporation of Manchester."

Tenders, enclosed in the official envelope, and addressed to the Chairman of the Rivers Committee, are to be delivered at the City Surveyor's Office not later than 9.30 a.m. on Monday, October 19th, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender.

THOMAS HUDSON,
Town Clerk.

Town Hall,
Manchester.
October 8, 1914. (1,994)

TOTTENHAM URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

The Council invite Tenders for making up—

South-grove (Section 1, Part 2).
South-grove (Section 1, Part 3).

The Plans can be seen, and Forms of Tender and other particulars can be obtained, on application to Mr. W. H. Prescott, M.Inst.C.E., Town Hall, Tottenham.

The sum of £5 for each road will be charged for the Quantities, which will be returned on receipt of a *bonâ-fide* Tender accompanied by the Conditions, Specification and Quantities; otherwise the deposit will be forfeited.

The contractor will be required to pay all workmen on the Council's work the recognised Trade Union rate of wages. A schedule of such wages will be inserted in the Contract, and a copy of the Schedule must be exhibited on the Pay Office at the works.

Canvassing Members of the Council is strictly prohibited, and if any Members, Agents or Representatives of Firms tendering for this work interview or canvass Members of this Council, Tenders sent in from such Firms will be immediately disqualified.

Sealed Tenders, on the Form supplied, endorsed "Tender for Making Up South-grove (Section 1, Part 2), and South-grove (Section 1, Part 3)," to be delivered to me by Twelve o'clock noon on Tuesday, 20th October, 1914.

No other form of Tender will be received.

Security will be required for the due performance of the Contract.

The Council will not be bound to accept the lowest or any Tender, and reserve the right to accept a part only of any Tender received.

(By order)
VINCENT A. BALLS,
Acting Clerk of the Council.

Tottenham.
October 7, 1914. (1,993)

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.
—MASSINGER: "The Fatal Dowry," Act ii., 2.

SANITATION AND WAR.

To the Editor of THE SURVEYOR.

SIR,—The 2nd London Sanitary Company has volunteered for service abroad, and a new Home Service unit is being formed to take its place. It is desired that the new unit shall be composed of men with definite experience in some branch of sanitary work.

There are, doubtless, many among your readers who have not seen their way to volunteer for service abroad who would be glad to serve their country at home.

The need is urgent, as many hundreds of thousands of men are now encamped or billeted on various parts of the country, in many cases necessarily without any sanitary arrangements beyond what they can improvise for themselves. Under these conditions, as shown by our own experience in South Africa, and that of the United States in the Spanish-American War, devastating outbreaks of disease must sooner or later occur unless the sanitary work of the various camps is carefully and conscientiously performed. Any failure in this respect will inevitably lead to a deplorable loss of life, and may even seriously cripple the country in the life-and-death struggle in which it is now engaged.

The chief danger lies in the failure of the vast majority of the men to realise the need for sanitary precautions, coming, as most of them do, from homes where the whole of the sanitary duties are admirably discharged without effort on their part by the local sanitary authorities.

The work of a sanitary company is to supervise the sanitation of camps and billets, to report defects, and instruct the sanitary squads of the various units.

Any of your readers desiring to join the new company, or to obtain further information concerning it, should apply to Lieut. Cave or myself, at the Duke of York's Headquarters, Chelsea (close to Sloane-square Station), on any week-day between 9.30 a.m. and 6 p.m. —Yours, &c.,

ARTHUR J. MARTIN,
Captain, R.A.M.C.(T.F.)
O.C. 2nd (Home Service)
London Sanitary Company.

Duke of York's Headquarters,
Chelsea, S.W.
October 5, 1914.

INVESTMENT IN HOUSING.

To the Editor of THE SURVEYOR.

SIR,—Many people are at the present time doubtful as to how they shall invest their money in view of prevailing uncertainties. The Garden Cities and Town Planning Association wishes to call attention to one method of private investment which may be of great national service.

There are at present in existence a number of schemes—such as the first garden city at Letchworth and the various garden suburbs which have been successfully started in various parts of the country—where building and development operations are now in danger of being curtailed through lack of capital, and where much work could be done if money were at once forthcoming.

As these schemes are all to meet the lack of housing, those prepared to help them would be securing three important points:—

(1) They would lessen both unemployment and the call upon relief funds.

(2) They would help to ease the pressing housing problem.

(3) They would receive a satisfactory financial return upon their money.

It should be pointed out that under recent legislation the advantage secured is far greater than the amount invested. The Local Government Board is prepared to advance to public utility societies a large proportion of the capital needed for housing purposes. If, as may well be the case, 80 per cent of the value of the property is advanced by the Local Government Board, every £1,000 of capital subscribed will mean £8,000 worth of building operations.

Information can be obtained from the offices of the Garden Cities and Town Planning Association, 3 Gray's Inn-place, London, W.C.—Yours, &c.,

In the name of the association,
(Signed)
SALISBURY, President.
CECIL HARMSWORTH, Chairman.
EWART G. CULPIN, Secretary.

October 1, 1914.

POSTPONEMENT OF MEETING.

To the Editor of THE SURVEYOR.

SIR,—I notice in your issue of September 25th an announcement of the meeting which the institute had arranged to hold at York on October 24th. This meeting has, unfortunately, owing to the present crisis, had to be postponed, but will be arranged when times are more propitious.—Yours, &c.,

E. WHITE WALLIS,
Secretary, Royal Sanitary Institute.

90 Buckingham Palace-road, S.W.
September 30, 1914.

[A short announcement with regard to the postponement of the meeting referred to appeared in our last issue.—Ed. SURVEYOR.]

MANCHESTER CLEANSING DEPARTMENT.

It is stated in the annual report of the Manchester Corporation cleansing department, which was issued on Monday, that the gross expenditure upon the work during the year (which ended on March 31st) was £21[illegible]28. The gross income was £6,367, so that the cost to the rates was £14,[illegible]60. An advantage was gained during the year by the reduction in the price of provender. The average cost per horse per week for provender and bedding was 11s. 10d.

From 140,367 dwelling-houses, 4,511 lock-up shops, and 4,404 workshops there were collected and disposed of during the year 142,468 tons of ashes, 8,176 tons of other refuse, 39,689 tons of warehouse and trade refuse, 6,682 tons of slaughter-house refuse, 1,801 tons of stable manure, and 2,353 tons of fish refuse. From the city thoroughfares and markets 88,100 tons of street sweepings and 4,679 tons of market garbage were collected and disposed of. The total weight of refuse collected and disposed of by the department during the year exceeded 312,000 tons, or over 1,000 tons each working day.

The department has 27 depots and yards, 33 destructor cells, and 20 boilers used for the destruction of refuse, four private railway sidings, four estates of 3,753 acres, 608 horsed vehicles, four locomotives, 109 broad-gauge railway wagons, 254 light railway trucks and bogies, 25 miles of light railway, 10 barges and a steam tug, and a stud of 460 horses. There is a staff of 1,760 employees, involving a yearly payment of wages of £125,744. Included in the income of the department are £7,793 for rents received from farmers on the Chat Moss and Carrington estates, £4,830 for the sale of manufactured manure, and £2,891 for the sale of mortar.

Dungannon Water Scheme. The Dungannon Urban and Rural Councils have given their consent to the proposed application for a Provisional Order for the acquisition of water rights and additional lands in the Altemore catchment area, and Mr. J. H. H. Swiney, of Belfast, has been appointed engineer in charge of the scheme.

Dermatine Valves.—In 1911 some Dermatine valves were supplied to a firm of pump makers in the North of England for use in a vacuum pump manufactured by them for a sugar refinery in London. The pump has been working practically night and day ever since, except for adjustments necessary with all new machinery. The valves were taken out recently, and the engineer informs the Dermatine Company that, although the valves have been working for three years, the wear on them is very slight. They have been put back in the pump with the prospect of working for some time. The engineer is willing to give every facility for the inspection of the valves by the engineers of other firms who write asking for an appointment.

SOME RECENT PUBLICATIONS.*

History of Bridge Engineering. By Henry Grattan Tyrrell. Price 8s. Chicago: Published by the author.

It would obviously be impossible to write a history of bridge engineering which would fill many large volumes, unless it were confined to a single [illegible] to be instalments [illegible] the art of bridge building, [illegible] of padding. It is therefore important to notice the limitations of the useful work before us. There are 161 pages, 6½ by 9½ in., of text and illustrations, the latter numbering 330, [illegible] drawn to a sufficiently large scale. Engineering details are shown to an extent quite adequate for the purpose of the book, and the author, having wisely refrained from introducing matter relating to the development of principles, or to design from principles, has produced a work which really is a history of bridge building [illegible] the employment of [illegible] and [illegible] examples [illegible] different types. In his preface the author writes: "Proficiency in any art or science is not attained until its history is known. Many a student and a designer finds, after [illegible] that the [illegible] which he studied were considered and mastered by others years or centuries before, perhaps with better results than his own." The history of engineering is, he considers, quite as worthy of attention as is the history of architecture. In condensing his material into a volume comparing in size with other text-books, Mr. Tyrrell has selected his illustrations from a stock of over 2,000, and has been obliged to omit a large number of views of ancient and mediæval bridges. It may be noted, too, that the word "history" does not imply that modern bridges have been neglected. "A large part of the volume is necessarily devoted to comparatively recent history, as the majority of bridges have appeared since 1760, when bridge building was revived in France under the direction of Perronet." The reproduction of the illustrations is very good, and heavy type is used here and there in a manner convenient for ready reference. There is an index of thirty pages, and a separate list of illustrations. Certainly this is a book to be recommended to English readers, and it should be regarded, not only as a technical work, but also as a library book.

Fergusson's Percentage Trigonometry. By J. C. Fergusson, M.Inst.C.E. Price 3s. 6d. nett. London: Longmans, Green & Co.

Mr. Fergusson's monumental work on the percentage unit of angular measurement, which appeared some two years ago, was so well received by those most competent to judge of its merits that he has been encouraged to supplement it by the present inexpensive text-book adapted for "schools, colleges, surveyors, navigators, and all who have to measure lines and angles." Mr. Fergusson's discovery simplifies plane trigonometry, and practically reduces it to arithmetic by a new method of numbering angles. We reiterate our formerly expressed opinion as to the real value of the discovery, and welcome the appearance of this work, which will no doubt tend to popularise it.

Biggar's Contracting World Directory, 1914. Edited by C. W. Biggar. Price 10s. 6d. London: R. Biggar & Co.

In the interval which has elapsed since the publication of the last issue of this directory, in March of last year, each section of the work has been carefully revised, and in particular the list of public works under construction has been brought up to date. The directory includes, among other matters, lists of architects, engineers to local authorities, railway companies and other bodies, and a comprehensive catalogue of contractors classified according to the special kind of work they undertake. The whole bears evidence of careful preparation.

The two latest reports of the British Fire Prevention Committee deal respectively with certain extinguishers constructed and put forward for test by the Great Western Railway Company, and with a report of some proprietary partitioning boards.

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

ARRANGEMENTS FOR WAR SERVICE.

ACTION OF THE SURREY COUNTY COUNCIL.

The chief business of a special meeting of the council last week was to receive and consider the following report of the Finance Committee as to the salary, status and future position of the officers, staff (including teachers) and other employees of the council and its statutory committees who are serving or hereafter enlist in His Majesty's forces during the war. After careful consideration the committee recommend:

(1) That the Reservists on the staff be paid their present civil pay less service pay and allowances.

(2) That in respect of all other county officers, members of the staff, teachers, officials and other employees in the permanent service of the council, those who were Territorial members at the date of mobilisation shall receive their present civil pay in addition to their service pay and allowances, and, of others, those for the performance of whose duties [illegible] can be made be encouraged to volunteer for service in any of His Majesty's forces, and such as are accepted for service shall receive their present civil pay with increments under the scale less service pay and separation allowance, if any, such deduction to be calculated from the date of expiration of any period of vacation on full pay that may be due at the date of enlistment.

(3) That the above arrangement shall commence from the date of embodiment or attestation as the case may be, and remain in force until September 30, 1915, or until the termination of the war, or discharge from service, whichever shall first happen.

(4) That all members of the staff serving in His Majesty's forces shall be reinstated without loss of civil pay or status, if convenient, in the original civil pay or status in the original posts, if convenient, or if not, in others of a similar grade.

(5) That the foregoing civil pay be subject in each case to the deduction of the whole or some portion of the premium on an insurance policy, available to September 30, 1915, for providing not more than £100, in the event of death in consequence of the war, provided that an insurance scheme be arranged with an assurance company with the approval of the Local Government Board.

Sir E. F. Coates, M.P., stated at the meeting that the cost of insurance would be from £4 to £7 for the period of the war. It was proposed that the county council should pay the premium in all cases where the employee's salary was not more than £130, and that above that sum the premium should be deducted from the salary. The Local Government Board would probably not allow the payment, but he hoped the council would take the risk of a surcharge. It was unanimously agreed to take the risk.

(6) That the committee be empowered to settle the details of a scheme for carrying out the foregoing recommendation.

In connection with the last recommendation, negotiations have been opened with certain assurance companies, and it is hoped that it will be possible to present to the council the outlines of a feasible scheme. The committee have authorised the chairman of the council, the chairman of the committee and clerk of the council to make such arrangements as may be necessary for temporarily filling the vacancies in the offices of the county council caused by the absence of those serving with the colours, and it is intended as far as possible to arrange that such vacancies will be filled by the appointment of suitable persons resident in the county who may have lost employment of a similar nature owing to the war.

The report gave rise to a very long discussion, but it was carried with a few verbal alterations.

In addition to those mentioned under the heading "Pro Patria," about forty of the outside employees of the borough surveyor's department, Wandsworth, are serving with the Army or Navy.

About thirty members of the outdoor staff of the borough surveyor's department, Ealing, in addition to the names in our Honours List, have joined the naval or military services. The council have passed a resolution that all positions shall be kept open, and that those away shall have their full salaries less the service pay they receive.

INSTITUTION OF MUNICIPAL ENGINEERS.

President Mr. Horace Boot, M.I.E.E., M.I.Mech.E.

Meetings will be held at Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

B. Wyatt,
Secretary
39 Victoria-street, S.W.

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

SANITARY INSPECTOR. October 10th. Fulham Borough Council. £120 per annum. Mr. J. P. Shuter, town clerk.

BURGH SURVEYOR. October 10th. Inverurie Town Council. £110 per annum. Mr. J. Kellas, town clerk.

ASSISTANT SURVEYOR (Temporary). October 10th. Harrowson-the-Hill Urban District Council. £2 per week.—Mr. John Strachan, clerk.

TOWN FOREMAN. October 10th. Willenhall Urban District Council. 35s. per week.—Mr. T. Edgar Fellows, engineer and surveyor, Town Hall.

CLERK OF WORKS. October 12th. Corporation of Coventry. £3 3s. per week.—Mr. J. E. Swindlehurst, city engineer and surveyor.

CLERK OF WORKS. October 12th.—Corporation of Newport (Mon.). £3 per week. Mr. A. A. Newman, town clerk.

SURVEYOR.—October 13th. Holsworthy Rural District Council. £130—£150 per annum. Mr. C. Kinsman, clerk, 8 North-road, Holsworthy.

ARCHITECTURAL ASSISTANT.—October 13th. Corporation of Exeter. £2 2s. per week. Mr. T. Moulding, city engineer and surveyor.

SURVEYOR'S ASSISTANT. October 13th. Ware Urban District Council. £52—£62.—Mr. G. H. Gisby, clerk.

ENGINEER AND SURVEYOR. October 13th. Portland Urban District Council. £200 per annum. Mr. R. A. Colenutt, clerk, Council Offices, New-road, Portland.

CHIEF SANITARY INSPECTOR.—October 16th.—Corporation of Edinburgh. £200—£400. Mr. T. Hunter, town clerk.

ENGINEERING ASSISTANT. October 21st. Neath Rural District Council. £90 per annum. Mr. D. M. Davies, engineer.

TEMPORARY ENGINEERING ASSISTANT.—October 22nd. Corporation of Nottingham. £140 per annum. Mr. Arthur Brown, city engineer.

SURVEYOR'S TEMPORARY ASSISTANT.—October 23rd.—Corporation of Salisbury. £150 per annum. Mr. Francis Hodding, town clerk.

ARCHITECTURAL ASSISTANTS.—Public Works Department, Ceylon. £300—£350.—Messrs. Gregory, Eyles, & Waring, 12 Dean's-yard, Westminster, S.W.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

MUTFORD.—October 21st.—Specifications and estimate of cost of two semi-detached houses, for the Mutford and Lothingland Rural District Council. Plans to be unsigned.—Mr. W. B. Forward, clerk, 148 London-road, near Lowestoft.

ST. HELENS.—October 31st.—Drawings of police buildings and fire station, for the St. Helens Corporation. Premiums, £100, £50, and £25.—Mr. A. W. Bradley, borough engineer.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

HINCKLEY. October 10th. For laying about 4 miles of water mains, erection of a workshop, and approach road, and the provision and fixing of wrought-iron fencing, for the rural district council.—Mr. E. H. Crump, engineer, Hinckley.

LANCASHIRE.—October 10th.—For the erection of a police station, for the Standing Joint Committee.—Mr. H. Littler, county architect, 16 Ribbleside-place, Preston.

MANCHESTER. October 10th.—For the erection of a school, for the corporation.—Education Offices.

CORNWALL.—October 10th.—For the erection of a new school and additions to existing school, for the Education Committee.—Mr. S. Hill, architect, Green-lane, Redruth.

KILLARNEY. October 10th. For the erection of twenty-seven cottages, for the rural district council. Mr. P. Carey, clerk.

WHITEFIELD.—October 12th.—For the erection of forty-eight houses, for the urban district council.—Mr. G. M. Denton, engineer and surveyor.

WALLASEY. October 13th. For the erection of tramway workshops, for the corporation. Borough Engineer and Surveyor.

WEST SUSSEX.—October 13th.—For the erection of new schools and alterations to existing schools, for the Education Committee.—Mr. H. P. Roberts, county education architect, Thurloe House, High-street, Worthing.

WALTHAMSTOW.—October 13th.—For the erection of boundary wall and iron fencing, for the Education Committee.—Mr. H. Prosser, architect, Education Offices.

ANNFIELD PLAIN.—October 13th.—For the erection of eight houses, for the urban district council. Mr. T. J. Trowsdale, surveyor.

PORTLAND.—October 14th.—For the construction of a public convenience, for the urban district council.—Mr. R. S. Henshaw, engineer and surveyor.

HAMMERSMITH.—October 14th.—For the erection of a urinal, for the borough council.—Mr. H. Mair, borough surveyor.

COLWYN BAY.—October 15th.—For the erection of an electric power station, for the urban district council.—Mr. E. M. Lacey, 12 Victoria-street, Westminster.

GILLINGHAM.—October 16th.—For the erection of fifteen cottages, for the corporation.—Mr. J. L. Redfern, borough surveyor.

KETTERING. October 16th. For alterations and additions to hospital, for the Joint Hospital Board.—Messrs. Blackwell & Riddey, 53 High-street, Kettering.

BEVERLEY.—October 17th.—For additions to lunatic asylum, for the Asylum Committee.—Mr. J. Bilson, architect, 23 Parliament-street, Hull.

LEICESTER.—October 17th.—For the supply and erection of steel plate girders and steel troughing, and the widening of Bow Bridge over the river Soar, for the corporation.—Borough Surveyor.

COSFORD.—October 17th.—For the construction of a brick tower, laying water mains, standpipes, valves, and other works, for the rural district council.—Mr. C. Dudley Bright, Polstead Heath, Polstead, Suffolk.

GODSTONE.—October 17th.—For the erection of ten working-class dwellings, for the rural district council.—Mr. T. C. Barralet, surveyor.

BLACKBURN.—October 19th.—For the erection of a fire station and firemen's dwellings, for the corporation.—Mr. W. Stirrup, 14 Richmond-terrace.

SIDMOUTH.—October 19th.—For the erection of forty-eight cottages, for the urban district council.—Mr. R. W. Sampson, architect, Manor Offices, Sidmouth.

SOUTHAMPTON.—October 20th.—For the construction of a covered reservoir, for the corporation.—

[illegible]

LONDON.—[illegible] For the erection of [illegible] Lambeth, for the [illegible] Superintending Architect, County Hall, Spring-gardens, S.W.

LONDON.—[illegible] For the [illegible] Lambeth, for the [illegible] Superintending Architect, County Hall, Spring-gardens, S.W.

MANCHESTER.—October 21st.—For the [illegible] the improvement of the Ardwick Cemetery, for the corporation.—Messrs. G. H. Hill & Son, Albert Chambers, Albert-square, Manchester.

IPSWICH.—October 22nd.—For the erection of a public baths, offices, &c., for the corporation.—Mr. J. E. Mace, borough surveyor and engineer.

MANCHESTER.—October 22nd.—For [illegible] for the corporation.—The City Architect, Town Hall.

CAVERSHAM.—October 24th.—For the [illegible] supply and [illegible] with all necessary [illegible] and the construction of a new footpath, [illegible] road district council.—Mr. H. Howard Humphreys, 28 Victoria-street, Westminster, London, S.W.

OYSTERMOUTH.—October 26th.—For the construction of [illegible] and concrete service reservoir and filter [illegible] for the urban district council.—Mr. W. P. Puddicombe, surveyor.

WEST HAM.—October 27th.—For the [illegible] of 48 [illegible] Cumberland-road, Essex, for the corporation.—Borough Engineer, Town Hall.

ILFORD.—October 27th.—For the erection of buildings and [illegible] work, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

BOMBAY.—January 7th.—For the complete manufacture, erection and equipment of a refuse destructor for the incineration of 200 tons of refuse per day, for the municipality.—Mr. P. R. Cadell, municipal commissioner, Municipal Offices, Bombay, India.

SWANSEA.—For the erection of 300 workmen's houses, for the corporation.—Mr. C. A. Broadhead, [illegible] Chambers, Prospect-place, Swansea.

Roads.

KESTEVEN.—October 10th.—For the supply of granite, slag chippings and rejections, gravel, and tarred macadam, for the county council.—Mr. W. B. Purser, county surveyor, Grantham.

WITHERNSEA.—October 10th.—For making up a road, for the urban district council.—Mr. J. B. Kirton, engineer.

WANDSWORTH.—October 12th.—For the repair of part of Wimbledon Park-road, Mount Ephraim-lane, Gatton-road, and Idlecombe-road, for the borough council.—Mr. P. Dodd, borough engineer.

STOCKTON.—October 12th.—For making up thirty-five streets, for the corporation.—Borough Engineer.

WIGTON.—October 12th.—For maintenance of the district roads, for the rural district council.—Mr. T. B. Simmons, surveyor.

BROADSTAIRS.—October 12th.—For the supply of granite macadam, pit flints, road pit gravel, for the urban district council.—Mr. H. Hurd, surveyor.

CAERPHILLY.—October 12th.—For the supply of granite metalling and gravel, for the urban district council.—Mr. A. O. Harpur, surveyor.

MOUNTAIN ASH.—October 13th.—For improvement to footways, for the urban district council.—The Surveyor.

LONDON.—October 13th.—For paving works with creosoted deal blocks, for the county council.—Mr. G. W. Humphreys, chief engineer, Spring-gardens, S.W.

WIMBLEDON.—October 13th.—For making up two streets, for the corporation.—Borough Engineer and Surveyor.

KNARESBOROUGH.—October 13th.—For private street works, for the rural district council.—The Surveyor, 14 Bower-road, Harrogate.

ANNFIELD PLAIN.—October 13th.—For private street works, for the urban district council.—Mr. T. J. Trowsdale, surveyor.

ASHTON-UPON-MERSEY.—October 13th.—For [illegible] up streets and passages, for the urban district council.—Mr. F. Hutton, surveyor.

HAMMERSMITH.—October 14th.—For paving the [illegible] of Dalling-road, for the borough council.—Mr. H. Mair, borough surveyor.

STOKE-ON-TRENT.—October 14th.—For making up certain streets, for the corporation.—Borough Surveyor.

ROCHDALE.—October 14th.—For making good part of a street, for the corporation.—Borough Surveyor.

SOUTHEND.—October 14th.—For making up a carriage road and [illegible], for the corporation.—Mr. E. J. Elford, borough engineer and surveyor.

GLAMORGAN.—October 14th.—For widening a [illegible] road, for the county council.—County Hall, Cardiff.

CHELMSFORD.—October 14th.—For private street works, for the corporation.—Mr. P. T. Harrison, borough engineer.

OLDHAM.—October 14th.—For making up certain streets, for the corporation.—Borough Surveyor.

BISHOP'S STORTFORD.—October 16th.—For the supply during the year of broken granite and granite chippings, for the urban district council.—Mr. R. S. Scott, engineer and surveyor.

HARROW.—October 17th.—For widening and surfacing, and laying out an open space, for the urban district council.—Mr. J. P. Bennetts, engineer and surveyor.

SHEERNESS.—October 20th.—For the supply of road materials, for the urban district council.—Mr. T. F. Berry, surveyor.

RAWMARSH.—October 27th.—For making up a street, for the urban district council.—Mr. J. A. Towse, surveyor.

WORTLEY.—For road widening, for the rural district council.—Mr. F. Crawshaw, surveyor, 45 Exchange-street, Sheffield.

Sanitary.

SOUTHPORT.—October 10th.—For a supply of salt-glazed vitrified stoneware socket-jointed pipes, bends, junctions, and gullies, for the corporation.—Mr. A. E. Jackson, borough engineer and surveyor.

BARNSLEY.—October 10th—14th.—For laying sewers and alterations to sewage disposal works, for the rural district council.—Mr. H. Jackson, 39 Newhall-street, Birmingham.

TONBRIDGE.—October 12th.—For laying stoneware pipe sewer and manholes, for the rural district council.—Mr. F. Harris, engineer and surveyor.

ILFORD.—October 13th.—For the construction of clinker contact beds and incidental works, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

SALTASH.—October 12th.—For laying a 9-in. sewer, for the corporation.—Borough Surveyor.

LANARK.—October 13th—November 9th.—For the construction of a sewerage system, for the Middle Ward District Committee.—Mr. W. L. Douglas, District Offices, Hamilton.

CORK.—October 16th.—For work of sewerage, for the rural district council.—Mr. J. Cotter, clerk.

DUNMOW.—October 17th.—For surface drainage work, for the rural district council.—Mr. A. E. Floyd, clerk.

ABERGELE.—October 17th.—For the construction of a stoneware sewer, for the urban district council.—The Surveyor.

ROMFORD.—October 17th.—For the construction of surface-water sewer and street works, for the rural district council.—Mr. W. J. Grant, surveyor.

GLASGOW.—October 19th.—For the construction of pipe sewerage, for the corporation.—Office of Public Works, Town Hall, Govan.

LEEDS.—October 21st.—For the construction of three screening chambers, screening-house, three detritus pits, two mixing chambers, distribution chamber, four precipitation tanks, main gauging chamber, storm overflow culvert and outlet, 18 acres of bacteria beds, effluent channel and culverts and gauging chambers, and laying cast-iron feed mains, for the corporation.—Mr. Geo. A. Hart, sewerage engineer.

RHYMNEY.—November 3rd.—For the construction of main outfall sewer, for the Sewerage Board.—Messrs. Willcox & Raikes, 63 Temple-road, Birmingham.

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. OCTOBER 16, 1914. No. 1,187.

Minutes of Proceedings.

Extraordinary Traffic: "Completion of the Contract or Work."

We made some comments recently in this column with reference to the time-limit for proceedings for extraordinary traffic fixed by the Locomotives Act, 1898, sec. 12, subsec. (1) (*b*). Our readers are, of course, familiar with the sub-section, and are aware that it fixes a general limit of twelve months from the time at which the damage has been done, with an alternative limit "where the damage is the consequence of any particular building contract or work extending over a long period" of six months after the completion of the contract or work. As pointed out in our previous remarks, the alternative does not cut down the general limit, but lets in claims which would otherwise have been barred by the latter. We dealt on the previous occasion with the question "What constitutes 'a particular building contract or work extending over a long period' within the meaning of the sub-section?"

Another question which has been the subject of controversy under the same provision is what is meant by the expression "the completion of the contract or work"? An engineering contract frequently contains a clause providing for the maintenance of the works for a specified period after their completion. Where that is the case, when does the six months within which proceedings for extraordinary traffic expenses can be commenced begin to run? In other words, must the action be started within six months from the time when the works were finished, or may it be brought within six months from the expiration of the period of maintenance? The courts have decided in favour of the former alternative (*Lancaster Rural District Council* v. *Fisher*, 1907, 2 K.B., 516)—that is to say (in the words of Lord Justice Fletcher Moulton), that "completion of the contract" means "constructional completion," and not contractual completion (*Carlisle Rural District Council* v. *Carlisle Corporation*, 1909, 2 K.B., at p. 475). This, however, still leaves open the question, what is "constructional completion"? And although this will generally be a question of fact, it may not be always easy to determine. One instance at least may be given in which the point was in dispute. A water company contracted for the construction of a watertight reservoir. The—or, rather, we should say, "a"—reservoir was completed, and water was let in by a certain date. The reservoir turned out, however, not to be watertight, and in order to comply with the contract the contractors were engaged for some three months afterwards in remedying defects. It was held by the Court of Appeal (reversing the Divisional Court) that the date of "constructional completion" was the date at which the defects were remedied, as it was only then that the thing to be constructed viz., a *watertight* reservoir was actually completed (*Reigate Rural District Council* v. *Sutton District Water Company*, 72 J.P., 301). Probably no one but the water company will be disposed to quarrel with this decision, but the distinction drawn in the Carlisle case between "constructional completion" and "contractual completion" seems to us to be a somewhat artificial one, and likely to create as many difficulties as it solves. Instances will readily occur to the reader in which maintenance may involve something very like "constructional" work. The moral for highway authorities whose roads may have suffered from extraordinary traffic extending over a lengthened period is to take care to launch their proceedings within the shortest time limit that may, under the most adverse interpretation, be applicable, even though this may involve the risk of having to bring further actions should future damage occur.

Electrolytic Sewage Disposal.

It is a good many years since the idea of utilising electric current for the treatment of sewage was first tried. After a number of experiments nothing further was heard of it for many years, but it has now again been introduced in several places. Particulars of a plant at Oklahoma City, United States, were published some time ago, and the total operating costs, including fixed charges, were given as 38s. 2d. per 1,000,000 gallons. We now learn from our esteemed contemporary *Engineering Record* that a similar installation of electrolytic sewage treatment plant has been in operation for some months this year on Long Island with considerable success, according to a report by the chemist of one of the boroughs which constitute New York City. The plant has been dealing with a daily volume of 25,000 gallons of sewage, and elaborate details are given of the chemical reactions which take place and of the degree of purification which has been obtained. Unfortunately the process involves the use of lime as well as electric current, with a consequent production of sludge, necessitating pressing and some means of disposing of the pressed cake. It is stated that the final effluent was clear and odourless, and that samples tested were found to be non-putrescible. In fact the company operating the system, which is patented, are prepared to guarantee the removal of not less than 90 per cent of total suspended matters, and not less than 99 per cent of total bacteria, and the working costs are given as about 33s. 8d. per 1,000,000 gallons. This is made up of 18s. for electricity and 15s. 8d. for about 11 cwt. of lime.

The results recorded with regard to the character of the final effluent appear to be quite satisfactory, but it is essential in all these new systems that the cost of operation shall be carefully investigated. On looking into this side of the question we find that the figures given above do not represent the whole expense. In the first place we find that the sewage was first passed through

a ⅝-in. screen. Anyone who has used screens of [illegible] will recognise that practically all the grosser solids are arrested by the screen, and so not dealt with by the process, but must be disposed of in some other way, causing considerable trouble and some expense. There is also the difficulty of keeping such a fine screen clean. Then again nothing is allowed for the cost of supervision or for sludge pressing and sludge disposal. When details are furnished of the actual total cost of the whole of the process we shall be in a position to make a proper comparison with other methods in general use at the present time. Meanwhile we are inclined to agree with the editorial comment of our contemporary that engineers will probably not receive the results of this experiment with quite as much enthusiasm as is contained in the report in question.

Both in this system of electrolytic treatment and in the recently introduced method of purification by aëration the chief factor is oxygen, and it will be interesting to see by which process the necessary amount of oxygen can be produced most economically. Incidentally, of course, in comparing the two methods, account must be taken of the respective costs of disposing of the sludge and the initial capital expenditure upon the necessary plant. Although investigations of this character may not be pursued so vigorously in the near future as in recent years, it is desirable to keep in touch with what is being done, as it is fairly certain that future improvement in connection with sewage purification will develop along one or other of the lines mentioned above.

*

Housing in Yorkshire, Derbyshire, and Dudley.

Lack of proper housing accommodation is like a thrice-told tale, yet the necessity for calling attention to it is still great, though not perhaps so great as it was. This week our attention has been directed to the contents of three official reports on public health, and it is noteworthy that all of them give prominence to the subject of housing, and insist upon the importance of improving the conditions in which the people live. The medical officer of health for Derbyshire, Dr. S. Barwise, in his annual report just published, while admitting that under the Housing Acts great improvements had been effected—during the year with which the report deals 191 dwellings were closed in Derbyshire, and 2,483 with serious structural defects were repaired—at the same time leaves no room for doubt that merely the fringe, so to speak, of the difficulty has yet been touched. It is shown, for example, that in the whole county an average of 5·3 per cent of the tenements are overcrowded. The Clay Cross district is the worst, with 9·7 per cent of the population living in overcrowded conditions, and it also presents the highest death-rate—in other words cause and effect. Dr. Barwise states that the rapidly growing colliery districts are chiefly rural, and that the cottages which have been erected recently for colliers have five rooms. This is satisfactory so far as it goes, provided, of course, water supplies and sanitary conditions are adequate, but it will be none the less necessary to exercise vigilance in the inspection of the premises to prevent the overcrowding caused by tenants letting rooms to lodgers with the perverse idea that they are thereby reducing their rent.

With respect to the West Riding of Yorkshire, the medical officer of health, Dr. Kaye, garnishes his report quite liberally with such phrases as "there is plenty to be done," "active steps are needed," and "needs to be expedited," in relation to housing conditions. In some places there is "a great demand for houses," which cannot, of course, be met as "private enterprise is quite inadequate." This is, we imagine, an outstanding feature of the problem that it would be folly to ignore. In a very large number of instances houses cannot be provided by private agency under what are considered acceptable economic conditions, and the housing question must therefore of necessity become a question to be dealt with largely by the municipalities and the urban and rural authorities. The other report to which attention is called is the result of an inspection made at Dudley by an inspector of the Local Government Board. From this it is ascertained that the standard of housing accommodation for the working-classes is low. Old and dilapidated houses are found in all parts of the town, built in courts, without back space, or sufficient light and air. Of some hundreds of houses of this type which were visited nearly half, we are told, "appeared to be unfit for human habitation, while many more, though not unfit, were of the most undesirable type, and would require extensive repairs and alterations before they could be regarded as being in a state reasonably fit for human habitation." Though it may be allowed that much has been done and is being done to remove a serious stigma from our national reputation, the pace of improvement must be greatly accelerated if we are to reach, much less overtake, the point at which our housing accommodation can be regarded as adequate for the health and comfort of the population.

*

Housing at Padiham.

The report which has just been issued as the result of an inquiry held at the instance of the Local Government Board into the sanitary circumstances and administration of the Padiham Urban District fully justifies the complaints in regard to housing which led to the investigation in question. Let it be said at once, however, that, with the exception of housing, the report shows that the administration of the various services in this district is very efficient. As far as the surveyor's department, of which Mr. John Gregson, ASSOC.M.INST.C.E., is the chief, is concerned, we are told that "the district has an excellent water supply; it is well sewered, and the sewage disposal works are adequate: the streets back and front are paved; the scavenging system is, for a small town, unusually efficient, and the destructor works are equal to present requirements." The report also notes the "careful and capable manner" in which the inspector of nuisances discharges his manifold duties, and the "intimate knowledge which he possesses of his district." The contemplation of all this excellence, however, awakens a sense of incongruity in comparison with the housing conditions in the district, and the inspector truly says that there is lack of proportion in the picture of a one-roomed or two-roomed dwelling, ill-constructed, damp, ill-lighted, and ill-ventilated, which is fronted by a street costing a guinea or more the foot run. These criticisms do not apply to the bulk of the housing, which may be regarded as "not unsatisfactory," but there is a considerable residuum of old property—situate chiefly in the Clay Bank and Partridge wards, much of which appears to be in a deplorable state. Of 197 houses examined in detail in these districts, at least forty-four are stated to be unfit for human habitation, while of the remainder about fifty may be regarded as "doubtful." The defects are those common to all old and neglected cottage property—dampness, dilapidation, defects of lighting and ventilation, unsatisfactory closet accommodation, and absence of larders, proper sculleries and washhouses. Unfortunately this state of affairs is combined with a deficiency of housing accommo-

action, so that it is a practical impossibility to make closing orders in those cases where they are urgently required. This situation can only be met by combining vigorous action in dealing with existing insanitary property with a bold housing policy.

Coast Sand Dunes.

The subjects of coast erosion and coast protection are so obviously important to an island community that it is remarkable that their literature is comparatively meagre. Indeed, it has been said that until the publication of Mr. Gerald Case's work on "Coast Sand Dunes, Sand Spits, and Sand Wastes,"* no book on the subject had been published in Great Britain. This is all the more surprising in the light of statistics given by the Ordnance Survey Department to the effect that in thirty-five years Great Britain has lost 6,640 acres by erosion, while 48,000 acres have been reclaimed during the same period. The question of erosion has hitherto been dealt with piecemeal by individual local authorities, and no central authority is in any way concerned with the establishment or maintenance of sea defence works. In view, however, of the very considerable changes which are constantly taking place in the coast line, a good deal may be said in favour of the adoption as a national service of adequate measures against encroachment. Similar considerations apply in the case of the control of drifting sand and the formation of dunes. The destruction that may be wrought by moving sand is greater than would appear at first sight. Thus, there are recorded cases of the burial of houses, churches, and even whole towns beneath a slowly drifting mass of sand. In one well-known instance a church was first completely submerged, and subsequently reappeared with the onward march of the moving sand dune. Much destruction of this kind can be prevented by first placing suitable obstructions so as to collect the material at desired points, and protecting the dune thus formed by vegetation. It has been said, indeed, that it is possible to convert sand wastes or useless belts of sand dunes into pine woods by a system of afforestation, while certain agricultural operations are not beyond the bounds of possibility. The whole question, like that of coast erosion, is one of great interest and importance.

Ferro-Concrete and War.

A perusal of the current number of *Ferro-Concrete* affords some interesting examples of the uses of reinforced concrete in war. For the protection of fortresses, for instance, the value of this material has been recognised by several European Powers, and in the light of recent events special interest attaches to its employment in the forts at Liége and Namur. Again, in the mountains of South Tyrol masked fortresses to command the passes are said to have been constructed by the Austrians, the guns being hidden by sliding doors of ferro-concrete of the same colour as the mountain sides. At Namur the twelve forts are arranged in a circle at a distance of about 6 miles from the centre of the city. Triangular in plan, they are strongly built in ferro-concrete, and have revolving and disappearing turrets. The approach to them is protected by a smooth and slippery glacis, which can only be traversed with great difficulty, and is commanded by the cross fire of the defenders. Owing to the strategic importance of the city at the confluence of the Sambre and the Meuse, Namur has been fortified for many centuries, and is now a link in the chain of fortifications along the valley of the Meuse. The river Sambre, separating the citadel from the city, is crossed by several stone bridges and by a footbridge of 170 ft. span by 10 ft. wide constructed for the Belgian Government in Hennebique ferro-concrete. The peculiar shock-absorbing power of ferro-concrete renders it specially suitable for use in the construction of defensive works—a matter which will, no doubt, receive increasing recognition by the naval and military authorities.

Sanitation and War.

In our correspondence columns last week there appeared a letter from Captain Arthur J. Martin, M.INST.C.E., announcing the formation of a new Home Service Unit to take the place of the 2nd London Sanitary Company, which has volunteered for service abroad. The duty of a sanitary company is to supervise the sanitation of camps and billets, to report defects, and instruct the sanitary squads of the various units, and it will be remembered that in drawing attention to Captain Martin's letter we pointed to the valuable experience which those engaged in sanitary work would be likely to gain by volunteering their services. This is evidently recognised by Mr. Horace Boot, the president of the Institution of Municipal Engineers, who has lost no time in bringing the matter to the notice of the members of that body. A special circular letter—a copy of which is before us—has been addressed from the offices of the institution to every member and student, and all desiring to join are recommended to communicate either with Mr. Boot or to apply direct to Captain Martin at the Duke of York's Headquarters, Chelsea, S.W. The appeal, we are sure, will not be lost on those to whom it is made, and should be instrumental in getting together the new company without loss of valuable time.

* * *

A Practical Point.

We have received from a correspondent in British Columbia, who is well qualified to speak on the subject, a letter in which he comments upon the high rate of exchange now in operation between Canada and Great Britain. The matter, perhaps, hardly comes within the legitimate sphere of a journal such as this, nor can we pretend to speak as experts with regard to it. Bearing in mind, however, the efforts which are being made at the present time to induce the Colonies to use British goods, the question of the rate of exchange is evidently important. Our correspondent points out that at the present rate it is impossible for the agents of British firms to quote satisfactory prices for goods to be delivered in Canada, and we feel that in asking us to give publicity to the matter he is endeavouring to call public attention to an important question. We therefore have much pleasure in complying with his request.

Vandalism in Belgium.

The ground covered by the members of the Society of Architects during a visit to Belgium in 1891, when they were received by the then King of the Belgians, Leopold II., is now the scene of so much architectural devastation that peculiar interest attaches to a meeting of the society which is to be held at 28 Bedford-square, W.C., on October 22nd. Mr. G. A. T. Middleton, A.R.I.B.A., the organiser of the tour in 1891, will exhibit lantern slides of the principal buildings then visited, and some others showing the devastation caused by the German bombardment. The lecture is free to members and friends introduced by them, and a few invitations are available, so far as the accommodation will permit, for others who may be interested. Written application for these must be made to the secretary.

Longtown Bridge, Cumberland.

FERRO-CONCRETE REPLACES CAST-IRON.

A ferro-concrete bridge is being built at the Historic Carlisle, to the designs prepared by Messrs. L. G. Mouchel & Partners, in connection with the scheme of Mr. William Finch, county surveyor of Cumberland.

The old cast-iron bridge at Longtown is rather an interesting structure, having been designed by Thomas Telford and built in the year 1820. It is said that the bridge was originally intended for another place, but that when erected at Longtown the spans were transposed, giving the bridge a peculiar undulating road surface. The gradients from the southern end—at the right-hand of the view—are, first, 1 in 14 up, followed by 1 in 18 down; then 1 in 20 down, 1 in 40 up, and finally 1 in 20 down.

In 1911 the late county surveyor and bridge engineer of Cumberland reported that the bridge was unfit for modern traffic, and the structure was then closed to traction engines and other heavy vehicles. In 1912 plans and estimates were prepared by the present county surveyor, Mr. William Finch, and submitted to the Highways and Bridges Committee. Three schemes were considered, one for a masonry bridge, one for a steel-girder bridge, and one for a ferro-concrete structure, the result being that the last was finally adopted.

The site chosen for the new bridge (states an article in the October issue of *Ferro-Concrete*) is near the old structure, the scheme providing for a slight diversion

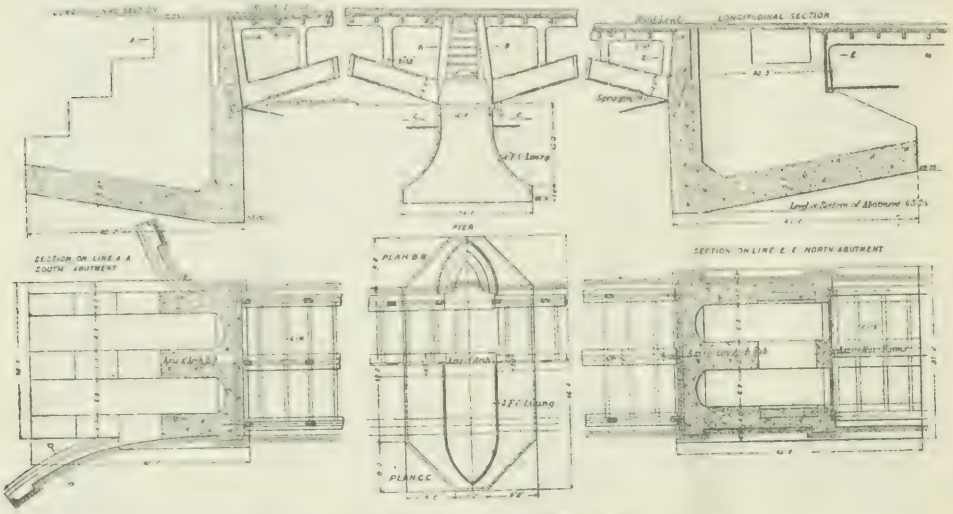

Fig. 1.—Details of Abutments and River Piers.

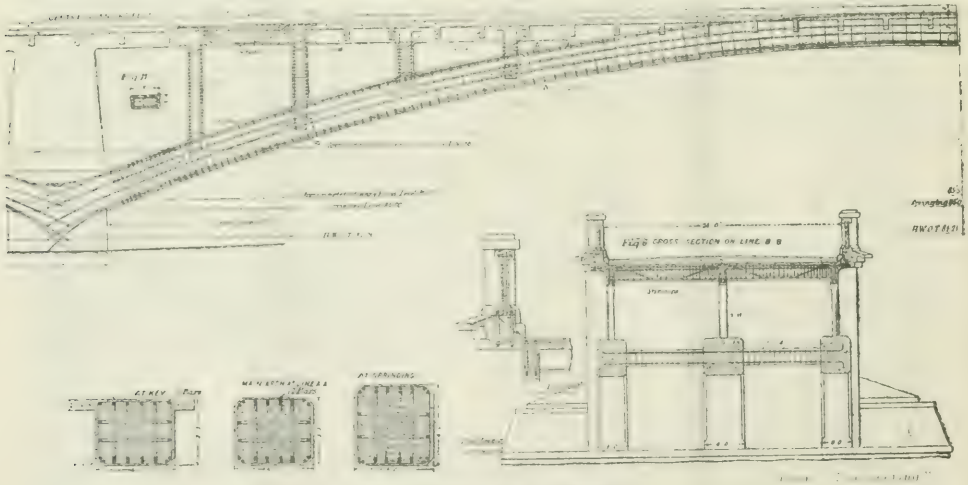

Fig. 2.—Details of Arch Construction.

Longtown Bridge, Cumberland.

and that when erected at Longtown the spans were transposed, giving the bridge a peculiar undulating road surface. The gradients from the southern end—at the right-hand of the view—are, first, 1 in 14 up, followed by 1 in 18 down; then 1 in 20 down, 1 in 40 up, and finally 1 in 20 down.

In 1911 the late county surveyor and bridge engineer of Cumberland reported that the bridge was unfit for modern traffic, and the structure was then closed to traction engines and other heavy vehicles. In 1912 plans and estimates were prepared by the present

of the main road with the object of improving the approaches. The new bridge consists of three arch-spans, with two short girder spans in the north approach. The central arch span is 175 ft. from centre to centre of piers, giving a clear span of 165 ft. The two shore spans are each of 147 ft. 6 in. to centres of piers, or 138 ft. 6 in. clear. The central arch has a rise of 8 ft., that of the two outer arches being a little less.

The normal rise of tide at the site is about 5 ft., and the arches are designed so that at the springing

they are about 17 in. above high water of ordinary tides. In general design the new bridge is plain, but of graceful lines. The only ornamentation is in the chamfering of the edges of the arch ribs and other structural members, and in the architectural treatment of the balustrades and piers.

Fig. 1 includes a selection of details illustrating the construction of the abutments and piers. The abutments are monolithic, and of L-shape, consisting of vertical concrete walls, 5 ft. 6 in. thick, facing the river with floors of similar thickness extending back at a slope of 1 in 6 for a distance of 40 ft. in the south abutment, as shown by the longitudinal section and section on line AA at the left hand of Fig. 1, and 15 ft. in the north abutment, as represented in the two corresponding sections at the right hand of the same illustration.

The difference in the length of the two abutments is due to the two approach spans at the northern end of the bridge. The full width of the abutment floors is 31 ft., the bearing area having been calculated for a pressure not exceeding 4 tons per square foot in the south.

Extending back from the vertical wall to the floor of each abutment are three concrete counterforts, the middle one 5 ft. thick, and those on either side 4 ft. thick. The south abutment is filled in with earth to road level. At the same end of the bridge the balustrades run out into two wing walls, as shown in Fig. 1, and ending in posts similar in design to the capping of the piers. The north abutment is filled in to ground level, and a 4-in. wall, rising from the ground to the underside of the decking of one of the approach spans, encloses the space above, as shown. At this end of the bridge the balustrade is continued over the approach spans on a slight curve, and beyond them ending in short posts similar to those at the southern end.

It will be noted from the two drawings in the middle of Fig. 1 that the river piers are supported on concrete foundations having bases 24 ft. wide by 46 ft. long in the direction of the stream. These bases rest on rock, the design providing for the full size being maintained for a height of about 3 ft. above the rock level, after which the width is gradually reduced to the pier width of 10 ft. The length is approximately maintained to the springing, for, though the piers are not actually of this length, the difference is made up by cutwaters on the upstream and downstream sides. The bases for the piers are of mass concrete of the proportions of 1:6, and have a 4-in. fine cement facing all over, ending at the top just below the springing in a coping 12 in. deep.

In each of the river spans the three arch ribs are of rectangular section, above each rib, and connected to it by spandrel columns, being a longitudinal main beam. The latter carry secondary beams, and the entire series of beams is connected by the decking, the whole being in monolithic connection. The arch ribs merge into the longitudinal beams and decking in the neighbourhood of the crown. Fig. 2 shows the middle rib of the central span, with the verticals and decking, in section. The rib of this span has a section of 4 ft. by 4 ft. at the springing, as shown, diminishing to 4 ft. by 3 ft. 3 in. some distance up, and finally measuring 3 ft. 3 in. deep at the key, inclusive of the decking. The two side ribs are of the same vertical dimensions, but have a width of 3 ft. throughout instead of 4 ft. The ribs are reinforced over the greater part of the span by twenty-four round bars distributed near the top and bottom surfaces, with two extra bars equally spaced on each side. As the ribs merge into the beams and decking, the upper twelve bars are reduced in number to six. The verticals between the ribs and beams measure 9 in. by 18 in., and are reinforced with four bars. The bracing between the ribs is 15 in. by 18 in. in cross-section, and is reinforced with four bars, as shown in the cross-section on line BB. There are four braces to each span. The two end spans of 138 ft. 6 in. are similar in design to the central arch, except that the width of the central rib is 3 ft. throughout, and that of the side ribs is 2 ft. 3 in. Their depth ranges from 4 ft. at the springing to 3 ft. 3 in. inclusive at the crown. The reinforcement is similar to that of the central span, except that at the centre the number of the upper bars is reduced to four. The verticals and bracing are identical with those already described.

The main beams are 9 in. wide by 18 in. deep throughout the length of the bridge. Extending between them and spaced at 4 ft. 6 in. apart, centre to centre, are secondary beams 6 in. wide by 14 in. deep. Above is decking 6½ in. thick, over which is laid road material to a depth of 9 in. at the crown. The reinforcement of the main beams consists of six bars, two of which are near the bottom and two at the top. The remaining two are bent up over the supports, as usual in Mouchel-Hennebique practice, but between the supports they run near the bottom. The secondary beams are similarly reinforced, but with only one straight bar near the top and bottom, and one bent bar near the top at the main beams and at the bottom between them. The small spans of the north approach have longitudinal and secondary beams, and decking similar to the main spans. The balustrade shown in section in Fig 3 is 4 in. thick, pierced with cross-shaped apertures. The top rail is 12 in. wide by 6 in. deep, and is reinforced with two bars.

ASHPIT CLEANSING AT BRADFORD.

COSTLY "DAY WORK."

Owing to the large number of wet ashpits that have been converted into water-closets, with dry ashpits or dustbins attached, it has been decided to alter the period of cleansing in those districts of Bradford where the work is done by contract from eight weeks to four weeks. In a large number of cases one small dry ashpit has to serve several houses, and even one side of a street. Very frequent collections are necessary in these cases. The capacity for storage in connection with the old type of ashpit would last the required time, but in some places the new ashpits require weekly visits.

The new system of "day work" was in vogue during the whole of last year, and the results, we gather from the annual report of the superintendent of the cleansing and destructors department, Mr. Ernest Call, have been far from satisfactory from a financial point of view. Several exhaustive reports, showing the comparative costs of working the "day" and "piece" systems, have been prepared by the city treasurer, in conjunction with Mr. Call's department, and from these it has been ascertained that the "day work" system has cost, in ten months, £2,755 more than what was paid for similar work during the corresponding period of the previous year. Further than this, it has also shown a decrease of 2,920 tons in the weight of refuse removed, and an average weight of 2½ cwts. less per load. A larger staff of workmen and horses has also been required, the average increase during this period being eleven horses and fourteen men.

Following an application from the men's union for an increase of wages, the whole question was again thoroughly gone into, and several joint meetings were held between the Cleansing Committee, representatives from the men, and the trades union officials. It was eventually decided to change back to the "piecework" system, all night work, until such times as the nature of the work permitted it to be done during the day-time.

British Fire Prevention Committee and the War.—The British Fire Prevention Committee is still short of fire surveyors (architects, surveyors or insurance officers) for occasional fire survey in the South of England, Home Counties and East Coast, and will be glad to receive applications, which should be addressed to 8 Waterloo-place, London, S.W. The committee have issued their hospital fire "Warning," No. 10, and copies may be obtained gratuitously by any hospital or convalescent home doing emergency work, or by any professional man in charge of hospital alterations or temporary buildings.

Farmers and Tarred Roads. — Last week, at Northallerton Police Court, Mr. Charles Thompson applied to the Bench for assistance in protecting the public against what he described as the "terrorism" which prevailed in the district in consequence of the condition of the main and certain district roads in the North Riding. He stated that from the Osmotherley and other adjacent townships farmers were absolutely afraid to use the "tarred" roads. Several serious accidents had occurred, and horses were almost frightened to death when on these dangerous roads. Northallerton market also suffered, as farmers were unable to get the produce down. Further stretches of roads were now being "tarred," and farmers would like this to be stopped if possible. The chairman (Mr. W. Brown) stated that the rural council had entered a strong protest with the county council. The Bench were powerless to act in the matter.

By-Laws and the Housing Question.*

By W. H. A. COURT, [illegible], Borough Engineer's Department, Leicester.

The question of the housing of the working classes is one which has attracted some attention for the past few years, and, in view of [illegible], seems destined to hold a prominent place in the public interests for the day.

Into a number of the reasons advanced for the cessation of private enterprise in the provision of dwellings for the working classes the author does not propose to enter for various reasons. One must be content, however, with the difficulty which appears to be experienced by speculative builders (the word "speculative" is used here in a good sense) in erecting cottages at a rent to give [illegible] return on their outlay. This difficulty is partly attributed, by builders and architects alike, to unnecessary stringency in the model by-laws and the local by-laws, which are, of course, based upon them, with, in most cases, considerable amplification.

With regard to the criticisms of the by-laws raised by architects of eminence and great repute, one point has always appeared to the author to stand out. This point is that they appear to overlook the fact that the by-laws have been framed with the object of endeavouring to meet all cases, and not for the ideal conditions with which these architects, because of their profession, have to deal. The author hopes to demonstrate his meaning more clearly in dealing with a few actual instances which have been cited in these charges against the working of the model by-laws in particular, and possibly one or two in force in the particular district in which the author is engaged.

To get at a reason for the excessive cost of cottage building, and the extent of the culpability of the by-laws in this direction, the author proposes to consider the cost under three heads—viz.:—

(1) The cost of the site.
(2) The cost of the building proper, and
(3) The cost of making the roads in which the building is situated.

With regard to the first—namely, the cost of the site—this may be dismissed at once, as the by-laws will have no influence on the matter.

The cost of the building itself has now to be considered.

In a paper read before the Royal Sanitary Institute by Mr. H. B. Searles-Wood, F.R.I.B.A., and published in the Journal of that institute in October, 1913, "The Architect's Grievance against the Model By-laws" is rather fully set out. The author of that paper quoted from a number of other papers read before other societies with the same object in view. The deposit of drawings, &c., for the approval of the local authority is one of the points mentioned, and the interpretation put upon the by-laws by the officials in their inspection of these plans. In this connection the issue is somewhat obscured by the claim that all artistic effect is suppressed, or at any rate that the tendency is in that direction. To remedy the repressing effects of the over-zealous building inspector, a Court of Appeal is proposed, by which it is hoped to obtain precedents for future cases to be fought out, and to render "elastic" the present cast-iron regulations. The difficulty of carrying out by-laws as they stand is already a sufficiently onerous task; if they were to be increased in the way suggested, it appears to the author to render the office of the surveyor and building inspector untenable. The cost of the building would not, at any rate, be reduced.

One great stumbling-block appears to be the minimum

HEIGHT OF ROOMS.

This was not contained in the original by-laws, and was added in 1891.

It has been proposed to reduce the height of rooms to 7 ft. 6 in. This appears to be the lowest limit generally reached. Such a reduction would certainly save, on the ground floor, 1 ft. of brickwork, and on the first floor a similar amount. This would be, without doubt, a considerable saving in the cost of construction; but surely it would not be wise at this time to suggest that the cost of a building should be reduced at the expense of the health of its inhabitants? This point was raised at the meeting of the East Midland District held at Newark in February, 1912. The case of a farm labourer's cottage was mentioned, in which the [illegible] was about 6 ft. high, and held the man and all his family. After a wet day in the open, a big fire in the evening with all the windows of the family present and the windows closed, the state of the air in the upper part of the room, at about the breathing level, can be more elegantly left to the imagination than to description.

The usual reply to this is that the workers must be educated to the beneficial results of fresh air and ventilation. It would appear to be safer to educate them to this idea in comparatively lofty rooms rather than to provide the lower level to the ceiling and to educate them afterwards.

The same arguments apply to bedrooms, but with added force. Space would undoubtedly be saved (and with it cost) were rooms in the roof not subjected to these restrictions. But here dormer windows are unavoidable, and consequently light must be, to a greater or less extent, kept out of such rooms, and with the light the beneficial effects of direct sunlight, well known to have great germ-destroying powers. Ventilation of such rooms would also be much more difficult. Further, the low portions of the rooms round the walls, being more difficult of access, could not be so easily kept clean. This may not be of such importance in the large houses in suburban districts (which are the houses probably in the minds of the architects in question), but in houses of the class under discussion, the author's own idea is that they should be so designed as to give every opportunity for being cleansed in the easiest possible manner, and that plenty of light should be accessible to every part of the room.

Reference may also be made at this point to the height of windows, though this will have small effect on the cost of the building. In the Leicester local by-laws it is required that at least one window in each room shall extend to a height of not less than 7 ft. 6 in. above the floor, and that the upper half at least shall be made to open. This seems a very reasonable requirement, and ensures that rooms can be ventilated above the heads of the occupants; whereas, were the windows lower—at, say, 6 ft. from the floor—the incoming air would create a draught at the level of the head.

It must also be noted that these by-laws are for the regulation of the builders, to ensure that they provide the means of thorough ventilation. It would be useless to educate the inhabitants in the advantages of fresh air and cleanliness were they compelled, owing to scarcity of houses, to live in dwellings where they would be unable to enjoy these advantages.

Another means which has been proposed for effecting the ventilation of rooms is by constructing a flue, with branches for each room, by the side of the chimney flue, and carried up above the roof with it. This would undoubtedly be extremely useful for the purpose, and the ventilation of the apartments would not be dependent upon the opening of the windows by the occupants. On the other hand, the extra cost would take up the saving effected by reducing the height of the rooms. Consequently the gain appears to be nil.

To the author's mind the direction in which economies may be looked for in the future will be found in careful planning (leaving the artistic elevations to follow the plan), and in the use of cheaper materials of construction in the minimum quantities.

Provision is made for this in the new Model By-laws (Series IV., draft form), by which (sec. 25, subsec. *b*) concrete, plain or reinforced, may be used "of such thickness as shall be necessary to secure due stability."

The third item in the summary of expense—namely, the

STREET MAKING

—must now be considered. Possibly it is in this item that the greatest initial saving may be effected. It is also in this direction that the greatest variation in the requirements of different districts may be found. It is therefore only proposed here to deal with the by-laws of the borough of Leicester. Here there are two standard types of streets—namely, the 40-ft. roadway paved with granite setts and the 50-ft. roadway

* Paper read at the recent district meeting of the Institution of Municipal and County Engineers at Hinckley.

with water-bound or tar-macadam carriageways. In each type the footpaths are laid with concrete slabs. These roads, and especially the first-mentioned and much more numerous kind, are certainly expensive to construct. It has been claimed that "over two-thirds of the cost of cottage building sites is" taken up by "these superior streets." There is another side to this, however, and that is the low cost of maintenance, repair and cleansing. Were a large number of streets of less enduring description to be thrown upon the hands of the corporation to maintain and repair, a very large increase in the annual cost of highway repair would ensue. This would result in an increase in the local rates, and would naturally tend to produce that overcrowding which it is the object, by providing increased accommodation, to prevent.

A number of extremely clever and ingenious proposals have been made to cheapen these streets, and one should be mentioned in particular. Starting from the proposition that repair is necessary in order to replace wear, the next step, evidently, was to find means to prevent wear. This was accomplished by having only a limited number of "through" streets, the remainder only being accessible to wheeled vehicles for half the length from each end, a set of posts or a small clump of trees being placed in the middle of the length to stop through traffic. This would undoubtedly be efficacious in preventing excessive wear, and would allow of less enduring construction. The author is not so sure of the moral effect on a carter with, say, a big load of coal, who might arrive into one of these "blind" streets by mistake. There probably would be further difficulties in the case of fire.

The author is of opinion that this paper will be considered to consist chiefly of destructive criticism. Any discussion will, he hopes, bring forward something constructive, however.

In conclusion, he apologises for the scattered nature of these few notes, which has been due to want of time owing to pressure of business.

SHEFFIELD CITY ENGINEER'S POSITION.

Proposals of a Special Committee for the rearrangement of the city engineer's department were adopted by the Sheffield City Council on Wednesday, and as a result Mr. C. F. Wike, M.INST.C.E., will be relieved of the responsible position which he has filled for the past twenty-five years, and take up duties of a less arduous character. His present salary will continue until June 30, 1915, after which, for a period of seven years his remuneration will be £500 a year. Mr. Wike will be styled city engineer, and he will be at liberty to engage in outside work. There will in future be a city surveyor in the person of Mr. W. J. Hadfield, the present surveyor and deputy city surveyor of highways, but until the final rearrangement of the department this appointment, like several others agreed to by the council, is to be regarded as temporary.

It should be noted that the Special Committee were not unanimous in making their recommendations. A minority report which was prepared, though not printed in the minutes, complains that no reason is given for the steps taken. This report goes on to say that there seems to be no reason why Mr. Wike, hale and vigorous, and with intellectual powers as keen as ever, should be removed from his present duties. It was felt to be a shabby way of treating an old and valued official, whose sterling integrity and intelligent devotion to the interests of the city had saved it so much money, and who had seen to the execution of so much public work which had been appreciated and admired over the whole country—it might even be said the whole world.

At Wednesday's meeting of the city council Alderman Wardley, in moving an amendment that the report be referred back for further consideration, said that underlying the attempt to shelve Mr. Wike there must be some ulterior motive.

Alderman H. P. Marsh paid a warm tribute to the work of Mr. Wike, but thought in his own interests the committee's report should be accepted.

Mr. W. Appleyard described the report as the baldest and most cold-blooded that had ever been presented to the council

Following some further remarks the amendment was lost, 15 voting in favour, 30 against, and 4 remaining neutral.

THE WAR.

WORK OF THE L.C.C. EMERGENCY COMMITTEE.

The Emergency Committee appointed by the London County Council to deal with any special matters arising in consequence of the war have issued a statement regarding their work since their constitution on August 11th.

In order to facilitate the progress of works of construction and thus to continue employment, the committee, with the concurrence of the Finance Committee, approved special arrangements with regard to payments to contractors, tenders accepted by the council but not completed as contracts before the commencement of the war, the responsibility of tenderers for future building operations, as regards rises in the price of materials, and current jobbing works contracts. They have taken steps to secure that overtime on works executed by or for the council shall be reduced to a minimum, and have received periodical reports as to overtime on such works. One of their first actions was to consider as to works which could be put in hand with the object of providing additional and useful employment, in contrast to what are known as "relief works," and in all departments work is being carried out with this object in view.

Apart from the provision of work itself, the committee have kept observation on the general conditions of employment in London, and from time to time have made representations in various quarters, with, they believe, useful effect. They have dealt with applications for the use, for His Majesty's services, of property belonging to the council, and have met to the full all requests put forward by the War Office and the Admiralty for assistance to meet the exigencies of the situation.

Arrangements have been made for the attendance of staff throughout every day and night in the office of the department of the clerk of the council, so that no delay shall occur in dealing with urgent business arising.

Messrs. Hughes & Stirling, having asked the Teddington Urban District Council if the council would be prepared to give any cover in the event of heavy rises in the prices of labour or materials in consequence of the war, have been asked to supply particulars of materials that have so risen.

The officers and men of the Thames Conservancy Board serving with the colours include thirteen from the head office, twenty-four from the navigation staff, and thirty-three from the outdoor works department. During service the full amounts of salaries and wages are being paid, less any pay received from the Government.

The whole of the indoor staff of the engineer and surveyor's department of the Wood Green Urban District Council have now undertaken special duties in connection with the war. Three members (whose names are given in our Honours List) have already enlisted for service at the Front, six others have joined the National Volunteer Reserve, and the rest, who are not fitted for military service, are acting as officials of the local branch of the Prince of Wales' Fund.

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.
—MASSINGER: "The Fatal Dowry," Act ii., 2.

MUNICIPAL ENGINEERS AND THE WAR.

To the Editor of THE SURVEYOR.

SIR,—May I appeal through your columns to the municipal engineers holding appointments in India and the various Dependencies on behalf of those younger engineers who, having volunteered for foreign service in various branches of His Majesty's Forces, are anxious (when military duties permit) to increase their knowledge on professional matters by inspecting engineering works?

The surveyors whose assistants are among these volunteers might greatly assist them with open letters of introduction, containing particulars of their municipal appointments and military description.—Yours, &c.,

G. BERTRAM HARTLEY.

Town Hall,
Alton, Hants.
October 12, 1914.

Institution of Municipal and County Engineers.

EAST MIDLAND DISTRICT MEETING AT HINCKLEY.

(Conclusion.)

Considerations of space prevented our reproducing more than a portion of the paper read by Mr. E. H. Crump at the recent East Midland District meeting of the Institution of Municipal and County Engineers at Hinckley. The concluding instalment, together with a report of the discussion which followed the presentation of the paper, is appended.

ELEVEN YEARS' MUNICIPAL WORK AT HINCKLEY.

By E. H. Crump, assoc.m.inst.c.e.,

Engineer and Surveyor to the Urban District Council.

The sewage of Hinckley is one of the most difficult to treat, as will be seen from the sample analysis given below, on account of the chemicals, &c., used in connection with the dye works and dry cleaning works in the town and district.

It is well known that the colour of a final effluent does not materially affect it, provided the oxygen absorbed, the albuminoid ammonia, &c., are of a fair standard of purity, yet it cannot be denied that if a coloured effluent is discharged into a brook in which there is scarcely any water running during any part of the year, the surveyor or manager in charge of the works would have anything but a peaceful time from the farmers and other owners lower down the brook, and consequently complications would be incessantly arising.

Another great difficulty now encountered is the furring up of the pumping mains, ejectors, &c., by the lime used in connection with the works, where pipes of a diameter of 8 in. have been reduced to 5 in., and pipes of smaller dimensions have been completely blocked, and in consequence of this a new 15-in. pumping main is about to be installed

Sample Analysis of the Hinckley Crude Sewage.

Date of analysis.	Free and saline ammonia.	Organic ammonia.	Chlorine in chlorides.	Nitrogen in nitrates and nitrites.	Oxygen absorbed in 4 hours at 80° Fahrenheit.	Total solid matter.	Suspended matter.
Jan. 29, 1914.	5·05	2·00	16·5	0,00	16·6	228	52

Analysts.—Messrs. Bostock Hill and Rigby, Birmingham.
Remarks. The sample was foul, reddish brown, and turbid.
Results of Analysis expressed in parts per 100,000.

The proportion of dye, &c., waste received is slightly over one-third of the total of the dry-weather flow.

The quality of the final effluent is not satisfactory, as the amount of oxygen absorbed is very high, of course, due to the chemicals, &c., in the crude sewage, and which are not removed by double land filtration.

In addition, the land is of an unsatisfactory nature, the substrata being clay; consequently the underdrains have had to be laid at a depth of 2 ft. 6 in. to 3 ft. 6 in. only, and in several parts of the farm the ground is sewage sick, and consequently unable to be utilised. The council and the author, in conjunction with the county medical officer of health, have for the past seven years been doing their utmost to relieve the existing unsatisfactory condition of affairs, and additional settling tanks have been constructed, the whole of the farm has been underdrained, an additional pumping plant provided, the system of blowing up or clarifying the sewage installed, new pumping mains laid down, and various other improvements made, but with no effectual remedy in the actual purification of the sewage. Another experiment that was tried was the double filtration through the land.

At the present time experiments are now being conducted, by means of percolating beds, to ascertain the effect of this system on the sewage. One bed, 21 ft. in diameter and 5 ft. 6 in. deep, has been filled with broken granite of varying sizes and fitted with a revolving sprinkler, has been at work now about twelve months, and from the knowledge gained up to the present it tends to show that this method, with certain improvements, will have the desired effect of producing a satisfactory effluent. The difficulty in this method, however, is with the lime used for removing the dye colour out of the sewage. The clarified sewage, in passing through the bed, deposits the lime on and immediately under the surface, which solidifies the filtering medium, and therefore is not satisfactory. If lime be not added the bed does not remove the colour by one filtration.

Another similar bed is now being constructed, to ascertain if the colour will be totally removed after second filtration, this bed being so arranged that the effluent from the first bed will be treated on the second bed.

The author has visited several of the sewage works of the large manufacturing towns in the country, and can safely say that he has never met with a sewage of such a colour to treat as that at Hinckley, to replace the existing 8-in. main, which has become inefficient.

The object of putting down the experimental percolating beds is to ascertain whether or not a colourless and satisfactory final effluent can be obtained by passing the sewage through a primary and secondary bed without having to use any lime whatever, which now costs about £200 per annum.

The pumping plant consists of gas engines and Shone's ejectors, and is at work twenty hours per diem, with the exception of Sundays, and the dye waste received from the Sketchley dye works is measured by means of a Kent's float and recording meter, and this sewage is treated by the council for the sum of £150 per annum for 30,000,000 gallons, and at the rate of 1¼d. per 1,000 gallons beyond this quantity.

The sludge is pumped into lagoons on the ploughed land and allowed to dry, and afterwards ploughed into the land again. About 4 acres are reserved for this purpose.

During recent years about 30 acres of grass land has been converted into ploughed land in order to assist its filtraton. The crops grown on the farm are oats, mangolds, cauliflower, brussels sprouts, cow cabbage, osiers, and rye grass, and the receipts, &c., are shown in the statistics above.

This question of sewage disposal has been one of considerable anxiety to the council for some years past, and it is hoped by means of the experiments now in hand that the problem will soon be solved, for the conclusion now arrived at is that it is impossible to treat a difficult sewage on unsuitable land by means of broad irrigation and land filtration.

THE GASWORKS.

The gasworks were purchased by the local authority in 1881, and for the first complete financial year, to March, 1882, the gas made was 18,600,000 cub. ft. The debt on the works was £35,080, or £2 4s. 3d. per 1,000 cub. ft. of gas sold. The price charged for gas varied from 4s. 4d. to 3s. 9d. per 1,000 cub. ft., and there were 573 consumers.

During the year ended March 31st last the gas manufactured was 102,510,000 cub. ft., and the debt £26,640, being equal to 5s. 4d. per 1,000 cub. ft. of gas sold. The works have been practically remodelled during the past fifteen years, most of the cost of extensions having been paid for out of profits.

Since the works were purchased £7,107 has been transferred to the District Fund for the relief of the rates, and the purchase of about 9 acres of land for

recreation ground, land for the erection of cottages, and extension of cemetery.

The prices charged for gas at the present time are 2s. 6d. per 1,000 cub. ft. for lighting and cooking, 2s. per 1,000 cub. ft. for heating, 1s. 7d. to 1s. 11d. per 1,000 cub ft. for engines and business purposes.

There are 3,322 meters in use, of which 1,594 are slot, or prepayment. The council hire cookers at low rentals, and there are over 1,700 in use.

Recently gas fires have been let out on hire purchase, and about 180 have been fixed.

There is no doubt the use of gas cookers and gas fires is, and will be, a great factor in solving the smoke problem, which in the larger towns is a very serious one.

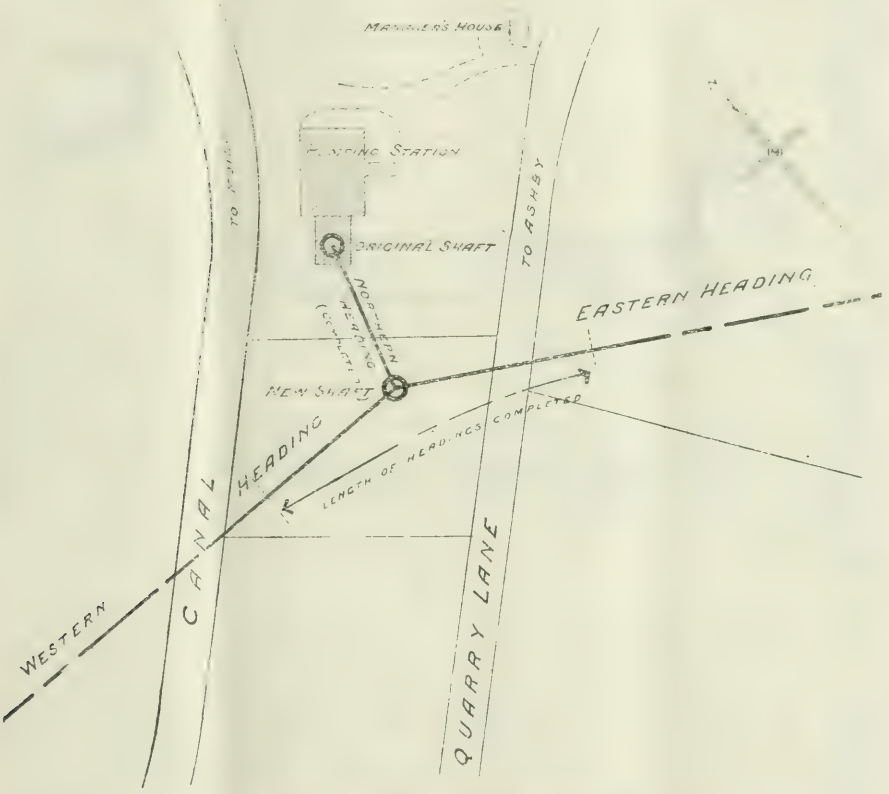
The total number of public lamps is 232 (240 burners), and of these 124 are inverted incandescent burners of 80-candle power and 116 are upright incandescent burners of 80-candle power.

WATERWORKS.

The whole of the town and a greater part of the district round is supplied by water from a disused coal shaft at Snarestone, about 14 miles from Hinckley. This supply was acquired by the council in 1888, under the Hinckley Local Board Water Act. A paper on these works was read at the annual meeting of Water Engineers, at Cheltenham, in 1912, consequently only a short description need be given now.

It was not until after eighteen schemes had been considered and six different consulting engineers engaged, and three boreholes sunk and abandoned, that the present supply was secured. The time taken up by the council in endeavouring to obtain a sufficient supply occupied twenty-two years, and during that period a considerable amount of money was expended.

Messrs. T. and C. Hawkesley, who were the engineers, carried out the present pumping station and the whole scheme of mains, reservoir and water tower.



Lines of Headings, Snarestone Waterworks.

The whole of the lamps except ten are lighted and extinguished by pressure, operated at the gasworks, the ten being worked by clockwork. The latter are fixed at cross roads, and are lighted at dusk and turned out an hour before sunrise. The others are lighted at dusk and extinguished at midnight.

The cost for gas, labour, &c., for the twelve months ended March last was: Gas (at 2s. 6d. per 1,000), £291 14s. 11d.; labour, £43 19s. 2d.; sundries, £8 8s. 3d.; making a total of £344 2s. 4d., or £1 8s. 8d. per burner. This does not include mantles and globes, these being provided by the gas department. The average number of mantles used per burner for the past year was 3·89.

The council have erected a tar plant for the dehydration of tar, all products being taken out of the crude tar up to 160 deg. to 170 deg. Cent., making the tar very suitable for road purposes.

The above particulars with regard to the gasworks undertaking have been kindly contributed by the engineer and manager, Mr. F. Lee.

The shaft is 534 ft. deep, and at the bottom there is a 3-in. borehole for a further 312 ft. The supply was taken from a depth of 120 ft. in the shaft, as the water below this depth was found to contain about 20 grains per gallon of common salt.

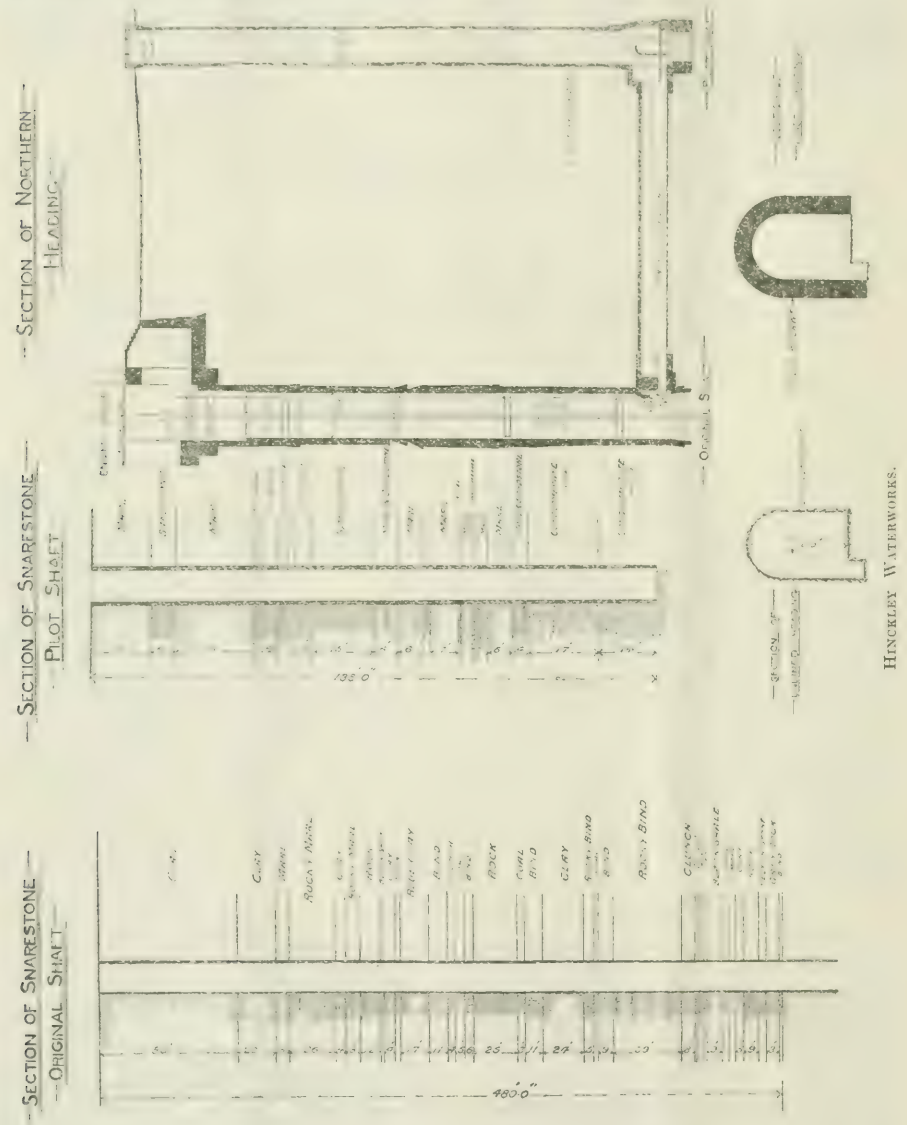
The service reservoir at Hinckley for the low-level district has a capacity of 500,000 gallons, while the water tower for the high-level district, which originally contained 50,000 gallons, has been enlarged to hold 90,000 gallons.

The supply at the commencement of the works was 360,000 gallons per diem, but at the time of the author's appointment here it was steadily decreasing, and in 1905 the supply was only 290,000 gallons per diem. The author was instructed to report on the provision of an additional supply, and various shafts and other boreholes in the neighbourhood were tested, but none of these schemes were found

tional pumping station having to be erected. The [illegible] with the driving of the headings at Snarestone, as suggested by the engineers in their original scheme, and after again consulting Messrs. Hawkesley it was decided to proceed with the work.

The [illegible] of a pilot shaft 80 ft. distant from the original shaft, the connecting of these two shafts by a northern heading, suddenly encountered, which increased the total yield from 260,000 gallons to 650,000 gallons per diem, which quantity remained constant after six weeks' continual pumping.

It took eighteen months to construct the pilot shaft and 163 lin. yds. of headings, so slow was the daily progress owing to rock and water. The drilling was performed by a rock-drilling machine worked by compressed air, and the yield of the headings, &c., was measured by means of a Parkinson's float recording apparatus in connection with a rectangular notch 12 in. wide.



Section of Northern Heading
Section of Snarestone Pilot Shaft

Hinckley Waterworks.

and the driving of two headings, one in a westerly and another in an easterly direction, each about ¼ mile long. The author acted as resident engineer, with various assistants.

The work of driving the headings was very slow on account of the conglomerate encountered, which could only be dislodged by gelignite and rippite cartridges, thirty of which were required per lineal yard. It was only found necessary to line the northern heading with brickwork.

It was in the eastern heading, at a point 75 yds. from the pilot shaft, that the additional water was

Several points gathered from experience in connection with this work were that (1) the pilot shaft was sunk too near to the original shaft, thus affecting the yield of the latter shaft, and causing great difficulty in keeping the town constantly supplied; also, the water levels in the two shafts were practically the same, and continuous pumping, both by the council's pumps and the contractor's pumps (in the pilot shaft), became necessary to keep the water down sufficiently to allow of the excavations being proceeded with. Again (2), the pilot shaft was too small in diameter. This might have been 10 ft. instead of 8 ft., for with

the 12-in. suction pipe on either side of the shaft, and the bucket lifting the excavated material continually passing up and down, there was scarcely any room left for the construction of the brick lining.

The cost of the work was as follows:

Pumping (use of plant and machinery), £400.
Pilot shaft complete, £1,220.
Northern heading, 80 ft. long and brick lined complete, £850.
Excavation per lineal yard of unlined headings, £3 12s.
Pumping during test, 3s. per hour.

The pumping engines are in duplicate, and are of the beam type, and of a nominal horse power of 30, with a speed of twenty strokes per minute. The total lift from the floor to the top of the water tower is 350 ft. Last year it became necessary to increase the capacity of the pumps, and the lift pump, originally 10½-in. diameter, is now 13½-in., and the force pump, formerly 13¾-in. diameter, is now 17½-in. The suction pipes in the shaft were also increased from 11 in. to 15 in. in diameter. Consequently, each engine and pump can now lift 500,000 gallons instead of 360,000 gallons per diem. The cost of installing larger pumps was about £2,200.

The pumping main is 12 in. in diameter, and the whole of the water pumped is delivered into the water tower, and when this is full the water overflows into the low-level service reservoir.

In addition to supplying the town of Hinckley, the parishes of Barwell and Earl Shilton, with a total population of 7,427, are now supplied direct from the pumping main at the rate of 9d. per 1,000 gallons, the water being measured through a nest of 7-in. meters fixed in a proper meter-house at the entrance to these parishes. This scheme was carried out by the author, and when completed will cost about £11,500. The parish of Burbage, with 3,000 inhabitants, is now being provided with a supply, under the author's direction, at a cost of £4,500. In each of these cases it will be necessary to erect water towers when the draught on the present water tower at Hinckley becomes excessive.

The analysis of the water is as follows:—

Results.—Expressed in parts per 100,000.

Date of analysis.	Free and saline ammonia.	Organic ammonia.	Chlorine in chlorides.	Nitrogen as nitrates and nitrites.	Oxygen absorbed in 4 hours at 80° Fahr.	Total solid matter.	Hardness.		
							Temp.	Permt.	Total.
Jan. 21, 1914.	0·047	0·004	7·5	0·11	0·023	75	11·7	18·4	33·1

From the above analysis it will be seen that the water is rather excessive in hardness, and inconvenience is, of course, experienced from this in factory boilers, &c., softening fluid having to be extensively used. The council, having had to incur a large expenditure on the water and other departments, have been unable to consider a scheme for softening the water, but they will undoubtedly give attention to this matter at the first favourable opportunity.

The yearly expenditure, including interest and sinking fund on loans, is now about £4,371, and the revenue from all sources about £4,411, which shows that the undertaking is paying, and this profit should now increase yearly.

The amounts borrowed in respect of the waterworks are:—

Loan for original works	£45,000
,, extensions	5,344
,, additional supply	6,300
Total	£56,644

As only about £11,394 has been repaid, £45,250 still remains owing.

As regards the consumption of water in the town of Hinckley, the average daily quantity pumped is about 271,000 gallons, or about 21 gallons per head per diem, which includes 7 gallons per head for trade purposes. The quantity used by the parishes of Barwell and Earl Shilton, which are in the Hinckley Rural District, is not included in the above figures.

All new service pipes to houses are now of lead, as the iron connections put in at the time of the installation of the works were found to be wearing out and corroding, and causing a serious waste of water. The cost of the renewal of these services with lead piping has to be borne by the council. All new services are laid by the council's workmen, and have to be paid for in advance, the cost being, for a 1-in. service £2 7s., ¾-in. £1 18s., and ½-in. £1 14s., which sum includes the necessary lead piping up to the boundary of the premises, and the provision of a stop-cock and box.

In conclusion, the author wishes to express his appreciation of the assistance rendered at all times to him by his council in the execution of the foregoing new works, and to cordially acknowledge the services rendered in connection with the preparation of this paper by his staff and brother officials.

DISCUSSION OF MR. CRUMP'S PAPER.

Mr. T. W. A. Hayward (Battersea) moved a vote of thanks to the authors of papers. He said that the members of the institution held Mr. Crump in high esteem, and they were glad to hear him spoken so well of. It was not always that an engineer was appreciated in his own country. Mr. Crump's statistics showed that the town did not suffer from overcrowding, although, fortunately, the erection of a few more houses would be a good thing. They had less than five persons to each house, and less than one house to the acre, so no one could say they were overcrowded. He was glad to see that their death-rate was as low as 13·1 per 1,000, which was remarkably low for an industrial district, and showed that the health of the people was well looked after. With regard to the roads, Mr. Crump told them that during the past four years various experiments had been tried in the coating of roads with bituminous material, but sufficient information had not yet been obtained to state definitely which was the best method for the district. He asked Mr. Crump, when he had sufficient information, to supplement that by a short paper, which would be of immense service to members of the institution. Mr. Crump also referred to the difficulties of treating the roads with bituminous surfaces, owing to the roads being made with too much crown. It was a difficult thing to improve the surface of a road when the fault was caused by the improper formation of the foundation in the first place, because of the danger of taking away a portion of the foundation. It seemed that a road could be surfaced and doubly tar-sprayed for 1s. 6d. per square yard. That must be taken as only applying to Hinckley. He wished he could do it in London, but that was out of the question. The same remark applied to tar-spraying at 1d. per yard. To make the paper complete, would Mr. Crump say what he paid for wages? And he presumed that the cost of chippings was also low. He congratulated Mr. Crump on a very good specification for new streets. With respect to refuse collection, he noticed that trade refuse was collected at a charge of 1s. per load. He could not imagine how trade refuse could be collected for 1s. per load, and he did not see why the trades-people should be helped out of the rates. With regard to the provision of workmen's dwellings, they were giving an excellent cottage, well planned in every detail, and the rent was very low indeed. The baths were, in a word, up to date, and quite worthy of careful inspection. With respect to the sewers, Mr. Crump told them that certain lengths were constructed in running sand, and that the contractor had carried out the work in a satisfactory manner. Some of them who had had to carry out the construction of sewers and of foundations in running sand knew the difficulties met with.

Mr. A. D. Greatorex (West Bromwich), who seconded the vote of thanks, said they realised the difficulties of an engineer in the carrying out of public works when a 1d. rate brought in only £150. Mr. Crump was to be congratulated upon the manner in which he had carried out the various works. The council were also to be congratulated on dealing with the housing question. Many large towns had postponed dealing with this important question, while

one of the greatest faults seemed to have taken place with great heartiness. He would like to see the scheme when developed, and he trusted Mr. Crump's estimate would be realised.

Mr. H. Gilbert Walker (Grimsby) remarked that Mr. Crump had stated that he was experimenting with [illegible] bituminous material, but such experiments had not yet been definitely obtained as to what was the best method of application. Mr. Crump went on to say that one or two of the results had been failures. Perhaps Mr. Crump would tell them which were the failures, and then they could [illegible] to keep their eyes open. As to lowering the crown of roads, he had received definite instructions from his council to take the work right down to the foundations, and take away the clay, rebuilding the road from the beginning. In Grimsby a bill was brought in £1,100 instead of £150 at Hinckley, and [illegible] A point which struck him on the housing scheme was why the rents were not raised, because if the rents were 5s. 1d. instead of 5s. a week the scheme would show a profit. It was [illegible] but at the same time it would allow the sixteen residents of these houses to pay the whole of their rent instead of being housed at some expense to the other working men in the district. With respect to the water supply, it was stated that the shaft was 534 ft. deep, and at the bottom there was a 3-in. bore-hole for a further 312 ft.; but the supply was taken from a depth of 120 ft. in the shaft, not borehole, as the water below this depth was found to contain about 20 grains per gallon of common salt. That was the point on which he was in doubt. Was it a misdescription? Another point was the excess of hardness of the water. The temporary hardness was stated as 14·7 the permanent as 18·4. What was the nature of the hardness? And he would like to know if it gave rise to goitre, or what was called Derbyshire neck, or any other ailment, and the general effect it had upon the inhabitants of the district.

Dr. Bostock Hill, medical officer for Warwickshire, remarked that there were two points in Mr. Crump's paper in which he was interested—the first was the treatment of the sewage, and the second was the question of water supply. Unhappily for Hinckley, its sewage effluent ran into a Warwickshire river, and he had to be the cat to look after the Hinckley mouse. He had had to call attention to conditions which were freely admitted by Mr. Crump in his paper, but their relations had been of an amicable kind. He had endeavoured to treat Hinckley with every forbearance, knowing the great difficulties they had to contend with. Hinckley had a population of [illegible], and had relied upon tank treatment and precipitation with lime, and land treatment, and single and double treatment in the way of filtration. He was quite sure Mr. Crump and their president knew that the problem that Hinckley had to deal with with the means at its disposal was an impossible one. Hinckley had a land area of 120 acres; therefore she was dealing with about 130 persons' sewage per acre. If his fifty years' experience of sewage treatment had taught him anything at all, it was this: that no land in the world would continuously take the sewage of more than 150 persons per acre; but to do that the land must be a light loam. In Hinckley it was not [illegible] on clay, and it was cumbered with the difficulty that it had a large industry which produced a waste liquor which was extremely difficult to deal with. The effluent from the dye works was one-third of the dry-weather flow. This cumbered the problem very seriously if it was only sewage, but it was a chemical liquid. He believed the Hinckley sewage works were capable of dealing with not more than thirty persons per acre; therefore Hinckley was endeavouring to deal with three or four times the amount of sewage it was possible to deal with. He could claim as much experience as anyone in bacterial treatment, and no one had done more to elucidate the problems connected with modern sewage works than their president; but he would agree with him that they must not forget that every place where the sewage was not normal must be dealt with by experiment. He was quite convinced that the experiments which would have to be carried out there would be somewhat lengthy, but he believed the facts would show that it was possible to deal with the sewage in such a way that a reasonable effluent might be produced. He noticed that the quantity of lime added was equal to 36 grains per gallon of the dry-weather flow. That was an enormous amount. He must say that great attention would have to be paid to the quantity of lime and lime salts, as these would tend to make an almost impermeable material near the top of the filter-bed unless great care was taken. He thought experiments should be made with a view to see whether it was not possible, having regard to the bacterial treatment, to eliminate some proportion of the amount of lime that was at present used; otherwise he was afraid there would be difficulties. Indeed, the whole thing was hedged round with difficulties, though he thought there was every prospect of the difficulties being overcome. With respect to the water supply, the amount of hardness was 33·1, and they would see from the analysis that the hardness was nearly half and half temporary and permanent. If manufacture by boilers did not [illegible] largely on Hinckley, he greatly questioned whether it would pay to soften the water. The temporary hardness might be reduced by 5, and whether a softening process was going to pay for that comparatively small reduction he had his doubts. Another point with reference to the Hinckley water was very interesting. It must be twenty-five or thirty years since he was first consulted as to this boring of water for utilising it for the Hinckley supply. It was condemned because of the large quantity of free ammonia it contained. It was much larger than at present, though the figure now given was very high, and, if they did not know something of its origin, would be almost sufficient to cause them to believe it was the result of animal pollution. He would like to congratulate Mr. Crump on the excellent work, in a general health sense, which had been done in Hinckley. If there was one thing which had occurred to him in this matter of sanitation, it was the manner in which the small towns had risen to the occasion, and raised themselves to a position sanitarily which, as compared with fifteen years ago, proved not only in Hinckley, but throughout the country, that a great amount of sanitation had been accomplished for the people who lived now, and for the generation which was to come. Although it had taxed their resources, everyone was convinced that they could make no better investment than in this cause of health.

Mr. Sholto Douglas (Kenilworth) remarked that the cost of ordinary water-bound macadam was given as 1s. 4d. per square yard, and granite, tar and pitch grouted at 1s. 7d. per yard. He could not imagine how Mr. Crump could do it at anything like the money; it was only 3d. per yard over the water-bound macadam. He had found that pitch-grouted macadam could not be done under 2s. 5d. per yard, and he could not lay tarred macadam for less than 2s. per yard. With regard to the housing scheme, he would like to ask if the balance-sheet given in the paper was the one submitted to the Local Government Board when the plans were sanctioned. The Local Government Board would not allow him to estimate less than £1 10s. per house per annum for repairs, but in Hinckley the allowance was £1 5s. With respect to the loan for these houses, he took it that they had already raised the money, otherwise they would have to pay 4 per cent interest, which would mean an addition of 3d. per week on the rent of each house.

Mr. F. Wright (Hinckley), alluding to the adoption of concrete tubes for the sewerage, said his own experience had shown him that these were very unsatisfactory in waterlogged ground. As regarded the cost of sewage disposal, the contribution of the Sketchley Dye Works—£150 per annum—seemed totally inadequate when the quantity of effluent which the local authority was called upon to treat was taken into consideration, and it appeared to be only reasonable that the company should be obliged to effect some preliminary treatment of their waste liquids prior to discharge from the works. The oxygen absorption figure in the case of the crude sewage was particularly high, but he would like to know the percentage of purification obtained.

Dr. Robinson, county medical officer of health, Leicestershire, remarked that an immense amount of lime was being used with the object of improving the effluent and putting an end to the complaints further down. The amount of lime used—36 grains per gallon—might be taken as approximately correct, but he did not think that anything like that quantity could become dissolved in the sewage. A large proportion would be deposited in the tanks as sludge. As stated in Mr. Crump's paper, compressed air was employed as an aid to clarification, and he would like everyone present to see for themselves how effective this "blowing up" method was. The combination of the excess of lime and the process he referred to produced an effluent which had the appearance of only a slightly

is screened water. Formerly the effluent had to stand a considerable time in the tanks. As to the question of nuisance dealt with in Mr. Court's paper, it was to be hoped that engineers and surveyors would not sacrifice the health of the people by any system of cutting down in the dwellings which they erected, and that district councils and all other authorities would keep an eye on the matter of bedroom space and ventilation. Not less than 400 cubic ft. of air space per adult should be insisted upon in every house, and nothing less than 300 cubic ft. per adult should be allowed.

The PRESIDENT (Mr. J. S. Pickering), in putting the vote of thanks, touched upon a number of points in Mr. Court's paper. His view was that it was rather a mistake to plant trees and plane trees in streets on soft soil, as had been done at Hinckley. Such trees were somewhat out of place for such narrow thoroughfares. He suggested instead the planting of small ornamental trees, which did not interfere so much with the light. Reference had been made to the interesting subject of the payment made by the dye works for the treatment of their wastes, and he would like Mr. Crump to give them some reason for that, especially as the company's works were outside the boundaries of the urban district. It occurred to him that they ought to contribute a very much larger amount, for it was not fair to the ratepayers of the town that they should provide sewage works for the treatment of effluents from factories outside their area. He would like also to know something more as to the process of lighting and extinguishing the street lamps from the gasworks. It appeared to be a most ingenious method, and one not generally adopted in other towns. It must effect a great saving in expenses. Mr. Crump was to be congratulated on the success which had attended his efforts to induce owners to give up land required for street improvements. Drainage and water connections were also carried at fixed prices. Such charges could not be legally insisted upon, but what had been accomplished at Hinckley was a proof that these matters could be dealt with by persuasion. He congratulated Mr. Crump also on the very low quantity of water consumed—14 gallons per head per day. With regard to Mr. Court's paper, he was afraid no power existed to enable them to carry out the suggestion as to a certain air space for every occupant of a house, and unless a local authority had a special Act of Parliament they had not the power even to govern the height of the rooms, and architects should not recommend the adoption of rooms of a height as low as 7 ft. 6 in. for working-class dwellings if they were not prepared to do the same thing in acting for wealthier clients. If in workmen's houses the space above a height of 7 ft. 6 in. was wasted, then they were only wasting the money of their wealthy clients in recommending anything above that for their houses.

The vote of thanks was carried.

Mr. CRUMP has communicated the following reply to the questions raised by the several speakers: In reply to Mr. Hayward, the cost of 1d. per square yard for tar-spraying is low, and this is no doubt due to the cost of the tar and granite chips; the former only costs 3d. per gallon, or £2 10s. per ton, while the latter is obtained for 5s. 3d. per ton, the quarries being quite near. A very careful record was kept of the cost of tar-spraying with distilled tar. An area of 23,500 sq. yds. was made up on four different lengths of road, and the total cost of this area amounted to £102 5s., which works out at 1·04d. per square yard; but it is only fair to state that nothing has been allowed for the use of the spraying machines, as these belong to the council. With regard to the points raised as to the running sand and water encountered during the laying of the new sewer of egg-shape concrete tubes, the invert of the sewer happened to be deeper than the layer of running sand; nevertheless, the whole of the trench had to be shuttered in; also under-drains had to be used, these being made to discharge into the existing sewer, which, fortunately, ran quite near to the new sewer. By this method we were enabled to deal with the water in the excavations. The tubes were laid on and encased with 9 in. of cement concrete, and, owing to the dimensions being 42 in. by 28 in., the tubes were jointed both on the inside and the outside. The experiments with the lengths of roads resurfaced with various materials up to the present lead us to assume that the best results have been obtained with Quarrite and Tarmac, as these two particular lengths, although situated in positions where the heaviest traffic in the town takes place, have worn exceedingly well. In reply to Mr. Whyatt, the original shaft at Snarestone waterworks was a shaft sunk for coal, and, on account of an insufficient quantity of this material being obtained, and owing to the quantity of water encountered, abandoned. An oak floor was inserted at a depth of 128 ft., and the bottom of the rising mains is 8 ft. below this floor, as it was only deemed desirable to take water from this depth for the reasons set forth in the paper. The new shaft is taken down to a depth of 128 ft., and connected to the original shaft by the northern heading, as shown in the section. With regard to Mr. Whyatt's suggestion to make the rent of the workmen's houses 5s. 1d. per week instead of 5s., in order to obviate the estimated annual loss of £2 5s. 1d. on the sixteen houses, this is impracticable, for at Hinckley all houses of 5s. weekly rental and under can be compounded for; consequently, if the rents were increased to 5s. 1d. the amount of all the rates would be doubled, and in order to get this extra amount returned it would be necessary to raise the rents to about 6s. 6d. per week. Under these circumstances it was thought more desirable to allow the rent to stand at 5s., especially as the land was already purchased out of the gas department profits, and originally only cost 1s. per sq. yard, and not 2s. 9d. as shown in the balance-sheet. The figure of 2s. 9d. was included so that the balance-sheet might show the actual estimated loss if the land were priced at the average value of building land in that particular district. In reply to Dr. Bostock Hill's and Mr. Wright's remarks concerning the use of lime and the colour of the effluent at the sewage works, after very many experiments we find it is impracticable, without the use of a very large quantity of lime, to remove from the sewage the colour caused by the dye waste. About 40 grains of lime per gallon—an excessive amount—is used. There is, again, no large stream into which our effluent can be turned, the only outlet being a ditch; so the difficulty in which we are placed can be well understood. If we add no lime to the sewage the effluent is of a very deep colour; if lime is used, then the danger of blocking of the filter-bed arises. Up to the present the experiments we are now conducting lead us to believe that lime or some other chemical must be used—to a degree to be ascertained—in order to take out the colour. The amount of £150 per annum paid by Messrs. Hawley & Co. for treating their dye waste is a vastly different amount than was paid up to fifteen years ago, when it was only 5s. per annum. My predecessor, Mr. F. C. Cook, managed to get it increased to £75, and within the last three years it has been increased to £150. Various difficulties, which cannot be stated here, arise in connection with this question, and even if Messrs. Hawley's dye waste were discontinued, there is another large dye works in the town which also discharges its waste into the sewers, and has never paid anything extra for this privilege, nor done anything in the way of preliminary treatment; also, both works are large employers of local workpeople. As regards the analyses of the effluents, these clearly show that the effluent, after passing through some parts of the farm, is worse than if it had not been put through the ground at all, owing to the land being soddened. Another point is that sewage which has been limed gives better results than unlimed sewage. The amount of oxygen absorbed, as shown in all the analyses, is excessive, but considerable improvement has been effected since the blowing up of the sewage in the settling tanks has been inaugurated. The council have now arrived at the conclusion that some system of filtration by trickle beds must be adopted, and that is the reason why the experimental filter-beds have been put down. Mr. Douglas wished to know if the cost of the fences were included in the cost of the houses. The fencing cost 4s. 2d. per lineal yard, and the whole is included in the cost of the houses in the estimated balance-sheet. The actual contract price for each house works out at £175, and of course this price now would be higher than at the time when the contract was settled. I shall be pleased to show him a copy of the quantities and prices at any time. The cost of the new road is not included in the price of the land, the reason for purchasing the site being to open up a road between two main roads; but, as stated above, the price of 2s. 9d. per square yard would well cover this. Mr. Douglas also asks the reason for the small difference between the price of 1s. 7d. per square yard for resurfacing and grouting in with pitch and tar and 1s. 6d. for resurfacing and twice tar-spraying. The figure of 1s. 7d. is the actual cost here of the experimental lengths, while the figure of 1s. 6d. for resurfacing and double tar-spraying is the author's general estimate for this work in other towns. At Hinckley, I should have

[illegible] ing too large. I regret that Mr. Court's paper has not [illegible]

Mr. E. Tarr, the engineer and manager, Hinckley, explained, in regard to the lighting and extinguishing of the street lamp from the works, that they put on an excess pressure of about an inch for about three minutes, the whole operation of putting on and taking off the pressure occupying about five minutes. They saved nothing in gas, but there was, of course, an economy in the matter of labour. He did not think they had had a "miss" for about three months. The only trouble was when the factories began to light at nights, and they then had to start the lamps before they would otherwise do.

Mr. Court also acknowledged the vote of thanks.

LUNCHEON.

Mr. G. [illegible], J.P., the chairman of the urban [illegible] Council, afterwards presided at a luncheon held at the Union Hotel.

Following the toast of "The King," Mr. F. C. Cook (Nuneaton) proposed the health of the chairman and members of the district council. The council, he observed, had extended to the institution a thoroughly hearty welcome, which they highly appreciated. They took that not so much as a compliment to themselves as a tribute to the zeal and efficiency of their friend Mr. Crump. Mr. Crump had been congratulated most deservedly upon the success of his work in Hinckley, but if he were speaking he would say that that success had been rendered possible by the excellent good feeling that had always existed between the members of the Hinckley council and their officials. Hinckley was a town with an ancient and honourable history. They saw it to-day clean, healthy and progressive. Those happy conditions were due, in a great measure, to the zeal and forethought of the district council, and they hoped that their labours would bear abundant fruit in the future, and that, under their guidance, Hinckley would achieve to unbounded prosperity.

The toast was received with enthusiasm, and the Chairman replied in brief terms. Mr. Crump, he said, was a very excellent officer. He had already carried out work costing something like £30,000, and had given great satisfaction.

A collection for the Orphan Fund of the institution realised a sum of £2 3s. 7d.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—The rapid increase of sand wastes around our coasts is indeed a serious one, and Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

Institution of Electrical Engineers.—The opening meeting of this body will be held on Thursday, October 29th, at 8 p.m., when the president, Sir John Snell, will deliver his inaugural address. At this meeting a marble bust of Michael Faraday will be presented to the institution by Mr. Llewellyn Preece, on behalf of the family of the late Sir William Preece, K.C.B., F.R.S., past-president.

Australian Federal Parliament Houses Competition. [illegible] the state of war existing, the Government of the Commonwealth of Australia has decided to postpone until a more favourable time the competition for the design of the Federal Parliament Houses to be built at Canberra. It was intended that the competition should be open to architects from all parts of the world, and that it should close in London and Melbourne during March, 1915.

A Glossary of Road Terms. By H. Percy Boulnois, M.Inst.C.E. Price 2s. nett. The St. Bride's Press, Limited, 24 Bride-lane, E.C.—The compiler of this road vocabulary says in his modest introduction: "Someone had to make a start," and it cannot be denied that with the thousand and more words he has collected a very good start has been made. . . Every reader of the glossary will recognise the industry of which proof has been given in its compilation, and due credit will be awarded for the courage and independence shown in the definition of some terms which hitherto been the subject of much heated discussion.—*Sanitary Record.*

THE ROAD BOARD.

GRANTS TO HIGHWAY AUTHORITIES: SIXTEENTH LIST.

During the months of July, August and September, 1914, the Road Board undertook additional advances to highway authorities, amounting in the aggregate to £373,562, of which £269,280 was by way of grant and £104,282 by way of loan.

The advances made and undertaken up to September 30, 1914, amount to £5,927,486. Of this total £4,375,742 is by way of grant and £1,551,744 by way of loan.

The formal grants completed, with the approval of the Treasury, during the last quarter, amounting to £902,657, were applied as follows:—

Road [illegible] improvements	£ [illegible] 464
Road widenings and improvement of curves and corners	3,544
Road diversions	1,699
Reconstruction and improvement of bridges	3,950
New road: Western Approach Road to London—75 per cent of actual cost estimated at	100,000

PRO PATRIA.

[SIXTH LIST.]

We present herewith a sixth list of municipal engineering and sanitary officials who are taking part in the war, and shall be glad to hear of other cases within the knowledge of our readers.

Abel, V. G., county surveyor's department, West Sussex County Council, Army Service Corps.

Barfield, G. E., district building inspector, Leicester Corporation, Lieut., 5th Northern General Hospital.

Bradley, H., county surveyor's department, West Sussex County Council, Royal Engineers.

Budgett, W. H., engineer and surveyor's department, Wood Green, has enlisted for service at the Front.

Cameron, W. S., engineering assistant, Leeds Corporation, Captain, Army Service Corps (Territorials).

Chippendale, H. M., architectural assistant, Leeds Corporation, Yorkshire Hussars.

Coggill, H., engineering assistant, Leeds Corporation, Leeds "Pals" Business Battalion.

Davies, Evan L., engineer's department, Pontypridd, Glamorgan (F.), Royal Engineers.

Davies, T., second assistant, engineer's and surveyor's department, Wealdstone Urban District Council, Royal Naval Division, Royal Engineers.

Davy, P. V., county surveyor's department, West Sussex County Council, Sussex Imperial Yeomanry.

Dent, G. R., engineering assistant, Leeds Corporation, Royal Army Medical Corps (Territorials).

Dixon, Sidney, assistant surveyor, Grimsby Rural District Council, "Chums" Battalion, Grimsby, Lord Kitchener's Army.

Dobson, R., engineering assistant to the Morley Corporation, No. 1 Company, 8th Battalion, K.O.Y.L.I.

Dunk, E. F. L., county surveyor's department, West Sussex County Council, Sussex Imperial Yeomanry.

Eggleston, G. W., highway surveyor to the Weardale Rural District Council, has accepted a commission in the Reserve Battalion, 6th W.L.I., Territorials.

Ellson, C. H., clerk, Leicester Corporation, Army Service Corps (T.).

Exley, R. B., pupil, city engineer's department, Leeds Corporation, Yorkshire Hussars.

Farmer, R. [illegible], assistant clerk, Wanganui-la-Zouch Rural District Council, 5th Leicesters.

Foster, L., surveying assistant, Leeds Corporation, Leeds "Pals" Business Battalion.

Freeman, F., clerk, city engineer's department, Leeds, Army Service Corps (Territorials).

Higgins, T., engineering assistant, Leicester Corporation, Naval Brigade, engineering section.

Horbury, Frank, highway surveyor, Ashby-de-la-Zouch Rural District Council, 5th (Reserve) Battalion, Leicesters.

Hosken, W., county surveyor's department, West Sussex County Council, Sussex Imperial Yeomanry.

Jackson, Percy Clifford, borough surveyor's clerk, Pontefract, Lincolnshire "Pals" Battalion.

King, J. H., engineer and surveyor's department, Wood Green, has enlisted for service at the Front.

Lee, John B., borough accountant's clerk, Pontefract, Royal Field Artillery.

Le Feuvre, W. T., electrical engineer to the Bexhill Corporation.

Marsh, J., county surveyor's department, West Sussex County Council, Royal Sussex Regiment.

Perkins, Frank K., pupil, surveyor's department, Burley-in-Wharfedale Urban District Council, West Lancs Division, Territorial Army Service Corps (Supply Section). Volunteered for foreign service.

Ryan, John, storeskeeper, surveyor's department, Pontefract, York and Lancaster Regiment.

Shaw, W. C., building inspector, Leeds Corporation, Leeds "Pals" Business Battalion.

Smith, S. G., engineer and surveyor's department, Wood Green, has enlisted for service at the Front.

Thompson, R. G., engineering assistant, Leeds Corporation, Yorkshire Hussars.

Todd, E. P., map mounter and printer, city engineer's department, Leeds Corporation, West Riding Regiment.

Witts, F., timekeeper, city engineer's department, Leeds Corporation, Royal Army Medical Corps (Territorials).

Wood, C. F., clerk, city engineer's department, Leeds, Army Service Corps (Territorials).

Wordsworth, J., engineering assistant, Leeds Corporation, Royal Army Medical Corps (Territorials).

Titford, Stanley H., secretary, the Roadmakers' Association (Incorporated), Empire Battalion, 7th Royal Fusiliers (Lord Kitchener's Army).

Mr. Richard Twelvetrees, late assistant editor of *Ferro-Concrete*, is now in France, second lieutenant, Army Service Corps (Motor Transport) Expeditionary Force.

We are pleased to be able to report that Sub-Lieut. E. D. P. Pinks, of the 1st Naval Brigade, the well-known Cambridge sculler, son of Mr. Edwin C. Pinks, of Westminster, has come safely through the trying ordeal of assisting in the defence of Antwerp, and has arrived, with the remains of his brigade, at Walmer Camp. The brigade was in the trenches outside the city for two days, and, although incessantly shelled, escaped, when the order to retire came, with comparatively few casualties. The route taken was across a pontoon bridge and through the burning city, and the point at which the brigade entrained for Ostend was only reached after an exciting march of eleven hours. The return to Dover was made on Monday night.

Housing Conditions in Birmingham.—The Special Housing Inquiry Committee of the Birmingham City Council, appointed on July 29, 1913, to investigate the housing conditions of the poor, to review the past policy of the council in administering the Housing Acts, and to make recommendations as to future action, have now issued an interim report, which will be submitted to the council on the 20th inst. There are, the report states, 43,366 back-to-back houses in the city, the condition of whose outbuildings is "degrading and disgusting." The committee are of opinion that nothing less than one private water-closet attached to each house can be considered satisfactory. There are 149,228 houses at rentals under 10s., and 67,052 under 6s.; 27,518 houses are situated in courtyards, 42,020 have no water supply inside the dwelling, and 5,028 have no separate water-closet.

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

[illegible] W. Pretlove, of Broxbourne, Herts, to whom [illegible] of the premium for July, has [illegible] to Leo (Edward Arnold), and [illegible] have been duly forwarded to him.

QUESTIONS.

Replies or answers are invited to the following questions:—

425. Strength of Materials.—Explain why the resistance of a long strut depends more on the stiffness of the material than on its strength.

429. Mechanics. A pair of blocks have three sheaves in the upper and two in the lower block. Find the pull required to raise ¼ ton, assuming ⅓ of the energy wasted.

430. Materials.—In what respects do Portland and Roman cements differ, and in what circumstances is the latter used? ("Beginner.")

431. Water Supply. Explain the difference between surface springs and deep springs, and state the geological conditions in which each occur.

432. Ventilation.—What is the distinction between "natural" and "artificial" ventilation?

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

426. Geodesy.—Give a formula for computing the difference in height between two stations by means of the observed heights of the barometer, and state the meanings of the symbols used.

The following is a formula by Laplace:—

$$\text{Difference in height in feet} = 60345{\cdot}51 \left\{ 1 + {\cdot}0011111 (t + t' - 64) \right\} \left\{ \log b - \log b' + \log \frac{1}{1 + {\cdot}0001 (T - T')} \right\} \times \left\{ 1 + {\cdot}002635 \cos 2\phi \right\}$$

where b = barometric readings
t = readings of "attached" thermometers
T = readings of air temperatures, or "detached" thermometers
ϕ = certain mean of stations'

Note. The accented readings are those of the higher station. Should the reader wish for a proof, one can be found in the appendix to Middleton & Chadwick's second volume on "Surveying."

Another and simpler formula for use with the compensated aneroid barometer is found in Colonel Mackesey's "Tables of Barometric Heights," and is as follows:—

$$\text{Difference in height in feet} = 67{\cdot}5 (S\delta) \left\{ 1 + \frac{t + t'}{1000} \right\} (\log b - \log b')$$

where t and t' = air temperatures at the lower and upper stations respectively
b and b' = barometric readings at the lower and upper stations respectively

This formula can be used with the mercurial barometer if the readings are first corrected for capillarity and reduced to 32 deg. Fahr. (N. S. J.)

427. Testing Drains.—What tests should be applied to house drains before being passed? Describe any appliances used.

There are many different tests which may be applied to house drains, some better adapted to certain circumstances than others. Undoubtedly, the two tests relating to the water test under pressure. The lower end of the drain should be first blocked with a screw-stopper, which is fitted with an expanding rubber band. The gullies should also be plugged. A right-angle band is then temporarily fixed at the head of the drain, enabling a straight length of pipe to be fixed upright and securely propped in position. The drain is then filled with water to the top of the upright pipe. Each joint should be separately examined several times at intervals, and any small leakage at once made good with cement, more water being added until it is again level with the top of the upright pipe.

The water should be left in the drain for some time, one hour is sufficient, then, if the water is still level with the top of the upright pipe, the drain is sound and can be filled in. The filling in should be done carefully, and finished before emptying the drain; then, if any damage has been done to the pipes during the process, the fact is evident by the water in the upright pipe having decreased in level.

Another test, almost as popular as the water test—is the smoke test. All the openings of the drain are plugged, with the exception of the top of the vent column. The test is applied at the lowest point, and the smoke may be generated by two methods. The most convenient is by smoke rockets, which in shape are similar to ordinary rockets, but have two small pieces of wood attached to prevent them rolling about, and to raise them above any water which may be in the drain. The rockets are lighted and placed in the drain, the stopper being inserted immediately afterwards. When smoke commences to issue from the top of the vent shaft, the opening should be plugged with cotton waste. All the joints are then inspected for signs of leaking smoke, and bad joints should be made good at once. The use of rockets, as previously stated, is the most convenient method, but their supply of smoke is limited. Therefore smoke generating machines are often used.

A smoke machine usually consists of a tank connected to a bellows. The tank is in two separate pieces, the bottom portion having double walls. The cavity between is filled with water. The top of the tank fits into this cavity, thus forming a water seal all round, and leaving the top piece free to move up or down according to the amount of smoke in the tank—on the same principle as a gasometer. The smoke is made by burning brown paper, specially prepared paper, or cotton waste, in the tank. Air is pumped through the tank from the bellows, and by means of a pipe from the tank to the centre of the screw drain-stopper smoke is forced into the drain. This test is undoubtedly the best, and the only practical one for vertical lengths of pipe, as vent columns, &c.

There are various other tests, such as pouring coloured water into the drain and examining the joints for any signs of leakage, also by pouring in liquids which emit a pungent odour, and by sending down grenades attached to a string which, when it is pulled, breaks a glass tube containing a fluid which gives off a strong smell. These last-named tests are, however, practically useless for testing new drains. (P. H., *Middleton.*)

The Civic Engineer's Who's Who, compiled by the editor of The Surveyor and Municipal and County Engineer, **for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the** St. Bride's Press, Limited.—*Liverpool Courier.*

Business Announcement.—Messrs. John Wolstenholme & Son, Albert Iron and Brass Works, Radcliffe, Lancs, announce that they have appointed Messrs. W. E. Horsman & Son, of 127 Pendle-road, Streatham, London, S.W., their sole agents for the counties of Kent, Surrey, Sussex, Hampshire, Buckingham, Middlesex and Essex.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Birmingham T.C. (September 29th. Mr. E. H. Bowes.)—£1,818 for the purchase of the Woodyard on the extension of Selly Park. It was stated that the park had served a very useful purpose for the residents of Selly Oak Ward. The Parks Committee desired to extend it, with a view to providing tennis courts and other forms of recreation.

Bradford T.C. (October 9th. Dr. W. W. E. Leeming.)—£100,000 for the purpose of acquiring the site and buildings of the Bradford Royal Infirmary, and making a capital contribution towards the provision of new infirmary accommodation. It was expected that the new infirmary would cost £200,000, towards which £80,000 had been promised, but the remainder could not be raised voluntarily at present. The scheme for the purchase of the present infirmary and the contribution by the corporation to the new infirmary had been approved by the city council.

Buxton U.D.C. (September 30th. Mr. F. O. Stanbrook.)—£11,550 and £1,300 for the purpose of mineral water baths.—The surveyor, Mr. F. Langley, stated that under the Act of 1904 the council acquired the hot baths and mineral water rights. The baths were acquired for the convenience and benefit of visitors. They were all one undertaking and under one administration. In the proposed scheme the baths would have concrete floors, all the ordinary woodwork would be replaced with Austrian oak, the walls surfaces and ceilings would be tiled, electric light and bells would be fitted, the interior would be decorated, and the whole place would be brought up to the most modern form. The £1,300 was excess expenditure on the work recently carried out which was entirely unforeseen. It was thought at the time that the estimate was low.

Enfield U.D.C. (September 24th. Mr. W. M. Cross.)—£1,800 required for an additional percolating filter at the council's sewage farm.—The clerk, Mr. T. W. Scott, stated that the filter which it is proposed to construct is very similar to and adjoins five others erected some few years ago. The existing filters are acting very satisfactorily, but having regard to the increasing quantity of sewage to be dealt with, and to the necessity of securing an effluent of a quality that cannot be objected to by the Lee Conservancy Board, into whose river it is discharged at a point in Tottenham below the intake of the Metropolitan Water Board, it is felt that an additional filter is required. The surveyor, Mr. R. Collins, explained the system of sewage disposal, and the inspector afterwards visited the farm. Mr. Cuthbert Brown, surveyor to the Edmonton Urban District Council, in whose area the farm is situated, was also present at the inquiry.

Ivybridge U.D.C. (October 8th. Mr. W. M. Cross.)—£4,000 for works of water supply.—It was stated that the object of the proposed loan was to complete the construction of the waterworks. The original estimate for the work was £8,100. The contracts were let in November, 1913, and the sum expended on the works up to March 31st last and the amount required for their completion totalled £12,100. The increase had been caused by (1) the rise in the price of materials and labour, estimated to account for £2,250, and (2) the heavy cost of contingencies and engineering, and the purchase of land and easements, amounting to £650 and £815 respectively more than the original estimate. The district council asked for a period of sixty years for the repayment of the loan. Mr. H. Francis, the engineer for the scheme, gave details of the proposed new works, the necessity for which, he said, had been recognised by the Local Government Board for some years.

Kingstown (Co. Dublin) U.D.C. (October 6th. Mr. J. F. Mahon.)—£7,900 for the erection of thirty-six houses for the working classes at Sallynoggin.—It was stated that the council had already built a large number of houses, but more were required. At present over 200 houses which were occupied were unfit for human habitation. Evidence was given by the council's surveyor, Mr. Joseph Berry.

Lancaster T.C. (October 1st. Mr. A. W. Brightmore.)—£1,680 for the provision of conveniences in Stonewell, Market-square (under the old town hall), King-street (adjoining the Assembly Rooms), and at Penny-street Bridge. The estimated cost of the conveniences was stated to be: Stonewell, £550; Market-square, £500; King-street, £200; Penny-street, £430.

Newquay U.D.C. (October 7th. Mr. W. M. Cross).—£700 for works for private streets improvements in St. John's-road and Golf-terrace, and £2,000 for works of sewerage.—It was stated that the proposed schemes would considerably help employment during the anticipated period of distress. The drainage scheme was to deal with storm water, and to remedy frequent overflows in Tower-road, Central-square, Marcus-hill, Harbour-crescent, and by the railway station.—The surveyor, Mr. J. Ennor, submitted details of the scheme.

Reading T.C. (September 28th. Mr. F. H. Tulloch). £6,750 for the widening and improvement of Oxford-street, and £430 for the construction of a convenience for women.—The borough engineer, Mr. J. Bowen, offered an explanation of the plans in detail. It was stated that the Road Board had agreed to make a contribution of one-half the estimated cost of the proposed road improvement.

Rhyl U.D.C. (October 9th. Mr. P. M. Crosthwaite).—£4,500 for the rebuilding and enlarging of the amphitheatre at the pier entrance. It was stated that the architect's and quantity surveyor's estimates varied from £4,400 to £4,756, and the inspector remarked that if those estimates were prepared before the war the council could not now expect to receive tenders anywhere near those amounts.—There was considerable opposition to the proposed scheme.

St. Annes U.D.C. (October 7th. Mr. A. G. Drury). £6,500 for the work. The council, it was stated, have leased 20 acres of the foreshore from Mr. Clifton at £50 per annum, and on a portion they propose to construct baths, and at some future date to make a marine lake on the greater part of the land. The bath, which it is expected will be finished for next summer, will be 330 ft. long and 120 ft. wide, and while deep enough for a certain width for important swimming contests, provision will be made for the absolute safety of the youngest bathers.

Selby U.D.C. (September 30th. Mr. W. O. E. Meade-King).—£3,800 for the purchase of property for the purpose of making a new road from Gowthorpe-street to Flaxley-road.—It was stated that the proposed new road will afford direct communication between two important thoroughfares, the extremities of which are in view of each other, but access from one to the other can only be gained by a circuitous route.

Swaffham R.D.C. (October 5th. Mr. H. A. Chapman).—£1,238 for the provision of workmen's houses.—It was asked that the loan for the land—£98—should be spread over eighty years, and the loan for the six houses—£1,140—should be spread over sixty years.

APPLICATIONS FOR LOANS.

Aberystwyth T.C.—£547 for alterations at the town hall.

Cambridge T.C.—£6,450 for the extension of the guildhall.

Carlisle T.C.—£22,000 for works of sewerage.

Coventry T.C.—£1,430 for the Parkside improvement.

Finchley U.D.C.—£1,600 for sewerage works.

Gainsborough U.D.C.—£180 for a new sewer.

Hessle U.D.C.—£3,500 for the purchase of land for street improvement.

Holmfirth U.D.C.—£3,285 for a housing scheme.

Kendal T.C.—£9,450 for gasworks extensions.

Martley R.D.C.—£3,500 for a sewerage scheme.

Pontefract T.C.—£3,000 for gas main extensions.

Ramsbottom U.D.C.—£3,276 for road improvement.

Rathmines U.D.C.—£10,000 for the provision of houses.

Tonbridge U.D.C.—£1,000 for a new promenade.

Tunbridge Wells T.C.—£4,155 for sewerage works.

West Bromwich T.C.—£5,547 for generating plant and cable.

West Riding C.C.—£7,669 for a sanatorium.

LOANS SANCTIONED.

Baldock U.D.C.—£870 for the purchase of land for sewage disposal.

Bangor T.C.—£1,165 for the purpose of the gas-works.

Barry T.C.—£6,900 for the erection of twenty-four houses.

Boston R.D.C.—£8,000 for the erection of workmen's cottages.

Bournemouth T.C. — £1,000 for sewerage and surface water drainage.

Bradbury U.D.C.—£2,800 for a recreation ground.

Brighton T.C.—£6,317 for thirty years for the erection of an infants department at the Coombe-road central school; £214 for a period of ten years for furniture for same; and £685 for a period of forty years for the purchase of 93 Ditchling road, for the purposes of public baths.

Darlaston U.D.C.—£368 for the purpose of a recreation ground.

Darwen T.C.—£650 for bowling greens and tennis courts.

Derbyshire C.C.—£3,650 for additions to the asylum.

Filey U.D.C.—£250 for street improvement.

Finchley U.D.C. £26,000 for 100 dwellings.

Glastonbury T.C.—£900 for works of water supply.

Godstone R.D.C.—£2,190 for the provision of houses at Limpsfield.

Gosport U.D.C.—£1,915 for the construction of a new road.

Knaresborough R.D.C.—£260 for works of water supply at Follifoot.

Midhurst R.D.C.—£780 for cottages at Chithurst.

St. Thomas R.D.C.—£5,500 for the Topsham water supply.

Scarborough T.C.—£16,700 for the South Cliff improvement.

Tilbury U.D.C.—£11,367 for a housing scheme.

Torquay T.C.—£850 for road widening.

Ulverston U.D.C.—£5,363 for sewerage and sewage disposal works.

Willesden U.D.C.—£25,000 for electricity extensions.

FORTHCOMING INQUIRIES.

OCTOBER.	£
20.—**Berwick.** For works of water supply (Mr. W. M. Cross)	—

23.—**Huthwaite.** For the purposes of the gas-works (Mr. A. G. Drury)...	—

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

What has been the effect on town clerks, clerks to urban authorities, and other municipal officials, on the receipt of the mass of literature which has emanated from the Local Government Board in connection with the "Prevention and Relief of Distress"? Would not the perusal of these complicated documents give them much food for thought, and will they not see that there could have been no lack of employment for those who had to prepare these documents, nor for those who have to master the contents?

* * * *

Would it not be possible for some geological expert, who was also somewhat acquainted with the needs of the highway engineer, to write a book on "Road Stones" on the same lines as that excellent book "Wood," by Mr. G. S. Boulger, F.G.S., which was published in 1902, and which contained chapters on various subjects that might equally be applied to stone? Could not, for instance, chapters be given on the origin and structure of various road stones, how they are to be recognised, for what purposes they are suitable, their defects, and how to test and select them?

* * * *

Will not the proposed "Farm Institutes" which are to be established in various agricultural centres in Great Britain, under a grant of £325,000 from the Development Commissioners, greatly assist in solving the problem of how to get the people back to the land? Could not the opportunity also be taken to establish some large beetroot sugar manufactories in this country now that the war has, more or less, cut us off from this commodity? Has it not been shown by many experts on this subject of profitable beetroot growing that such a project would bring a large number of acres of land back into cultivation, and employ a considerable amount of labour?

* * * *

Does not Mr. Eastwood's thoughtful and clever article on "Traffic Factors" in the issue of The Surveyor of the 2nd inst. clearly demonstrate the difficulty of obtaining a true coefficient upon which any fixed and reliable formula could be framed as a guide to the construction of the road of the future? Shall we not have to be satisfied, for some time to come, with a sort of empirical division between roads of light, medium, and heavy traffic, ascertained by traffic observations and calculated on the basis of tons of traffic per annum per yard width of carriageway?

* * * *

Is it a fact that the War Office is now engaged in erecting huts in various parts of the country in order to accommodate the vast number of men who are forming our new Army? Should not this work give employment to a large number of men who might otherwise be out of work? Will it not also tend to change the rural character of some of the districts in which these "hut towns" are being formed? Will these huts be erected in a substantial manner and allowed to remain permanently, as was the case at the time of the Crimean War?

* * * *

Why have the London gas companies found it necessary to raise the price of gas to their consumers? Would it not have been supposed that, as during the war less coal would be exported, the price of that commodity would have fallen, and that consequently there should be no increase in the price of gas? Or is the increase due to there being less consumption, rendering it necessary for the companies to put up the price in order to maintain their dividends?

* * * *

Are medical men and bacteriologists yet agreed as to the safety of swimming-bath water which is changed only once every three months, or even at less frequent intervals? Is it certain that disease germs are rendered innocuous or are altogether eliminated by filtration and aëration, or is the water thus treated merely cleansed of its dirt and human emanations, including the chlorine? Is the electrolytic treatment of the water as practised at Poplar more reliable, and does it actually sterilise the water?

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings Bedford £4,000, Glasgow £14,000, Scarborough £10,000, houses and town planning Hartlepool £15,000, Liverpool £25,000, Morley £18,856, roads and materials Carlisle £12,500, Hackney £17,200, Walsall £11,197, sewerage and sewage disposal Carlisle £22,000, L. £17,000, Irlam £15,000, water, gas and electricity Atherstone, Plymouth. Particulars of other projected works will be found under "Local Government Board Inquiries" pages.

BUILDINGS.

Birkenhead T.C. The services of Mr. T. T. Rees, architect, have been retained in connection with the town improvement scheme, including the provision of industrial dwellings, the cost of which is estimated at £72,000.

Brighton T.C.—Councillor Lintott at a recent council meeting stated that the pavilion had been painted by the borough surveyor, Mr. H. Tillstone, under direct labour, and that the estimate was £800, plus 10 per cent for having men from the Distress Committee. The estimate on that occasion was £880, but the work was done for £745. The result went to show that it had been proved economical for the painting to be done by direct labour. The council now agreed that the internal painting at the borough sanatorium and the repainting of the corporation property in Dewe-road be carried out by direct labour.

Bristol T.C.—A committee has been appointed to report on the desirability of the construction of a bridge across the floating harbour from Freshford-lane in a direct line with Bell-avenue, Queen-square.

Canterbury T.C.—The council have approved the plans of the city surveyor, Mr. A. C. Turley, for the extension of the small-pox hospital.

Deptford B.C.—The council have approved the plans of Mr. A. W. S. Cross for combined baths, wash-houses, and library, at an estimated cost of £5,000.

Derby T.C.—The tender of Messrs. Pegg & Bailey, at £5,159, has been accepted provisionally for the erection of a Carnegie branch library at Alverston, and the tender of Messrs. R. Weston & Son, at £4,770, has also been accepted provisionally for the Normanton branch library.

Glasgow T.C.—It is intended to expedite the scheme for the Bridgeton public hall, which is estimated to cost £14,000.

Portrush U.D.C.—The surveyor has received instructions to prepare a rough sketch for improvements to the town hall, and the erection of public baths, at a cost not exceeding £5,000.

St. Germans R.D.C.—It has been agreed to join with the Saltash Town Council and the Torpoint Urban District Council in promoting a scheme for an isolation hospital.

Scarborough T.C.—Application is to be made to the Local Government Board for sanction to borrow £10,000 for making a bathing pool on the north side of the town. This is in addition to the bathing pool which is now being made on the south side of the town.

Taunton T.C.—The borough surveyor, Mr. D. Edwards, has received instructions to prepare plans and specifications for the erection of a covered swimming bath and slipper baths, at an estimated cost not exceeding £3,000.

West Riding C.C.—The Highways Committee have agreed to spend £1,700 in widening Penistone Bridge over the river Don, carrying the Doncaster and Salter-brook main road.

HOUSING AND TOWN PLANNING.

Arundel T.C. A letter has been received from the Local Government Board adverting to a previous letter with reference to the council's scheme for the erection of workmen's dwellings, and stating that it was not contemplated that any means otherwise than by loan would be allowed under the Housing (No. 2) Act, 1912. If, owing to the war, the council were involved in any additional expenditure in carrying out the scheme, the board would be prepared to consider an application for an additional loan to cover it.

Ayr T.C. The Housing Committee have submitted a report that they were satisfied there was a scarcity of houses in the burgh, and were of opinion that the council should proceed with a scheme for the erection of two-story tenements containing two and three apartments, the number of houses meantime not to exceed fifty. The committee were further of opinion that no single-apartment houses should be included in the new tenements, but that existing properties should be acquired and converted into that class of house.

Bristol T.C.—The Health Committee have adopted a resolution of the Scarborough Corporation affirming that the procedure for the acquisition of land and other property for housing and improvement purposes is cumbrous, costly and dilatory, and the amount payable for compensation frequently excessive, so that the introduction of a comprehensive measure for simplifying and cheapening the present procedure is very desirable.

Carnarvonshire C.C.—The medical officer of health, Dr. E. L. Parry Edwards, reports that the housing problem in the county demands very serious attention. At the end of the year there were about 626 workmen's dwellings vacant, of which one-half were in the urban district of Bethesda, and 645 houses were reported as unfit for human habitation. There is a general dearth of workmen's dwellings in the county with the exception of the district mentioned and the Ogwen, Bangor and Geirionydd districts. The wages earned by the average artisan are not sufficient to enable them to pay a rent at which new sanitary houses can be put up, and therefore the majority of the district councils endeavour to improve existing dwellings.

Chard T.C.—The Local Government Board wrote inquiring into the present position of matters in connection with the council's proposed housing scheme, and it was resolved to reply that the matter had been postponed on account of the present state of affairs, but that the council had now decided that the borough surveyor, Mr. E. W. Hearn, should go forward with the specifications with a view to the council, at the next meeting, inviting tenders for the erection of three houses.

Essex C.C.—It has been agreed to build thirty cottages for roadmen.

Hartlepool T.C.—The council have approved a housing scheme, which is estimated to cost £15,000. The area to be dealt with is the Cleveland-street and Ropery-lane district, in the centre of the town. One hundred and eight houses are to be pulled down, and at present the corporation intend to build thirty-four new ones. An improvement scheme to cost £8,400 in the same neighbourhood was approved recently.

Hull T.C.—The council last week resolved to proceed with the scheme of the Sanitary Committee, involving the clearing of the New George-street area. By this scheme, under the Housing and Town Planning Act, 252 houses are to be provided at a cost of £67,150; the site is estimated to cost £36,000, the street works £4,120, and the charge on the rates will be £2,561 per annum.

Liverpool T.C.—It has been agreed to proceed with the erection of houses on the Gore-street, Jordan-street and Sparling-street areas, at an estimated cost of £25,000.

Morley T.C.—It is intended to build eighty-six industrial dwellings, at an estimated cost of £18,856.

Motherwell T.C.—The council have approved a housing scheme on the cottage system, and last week they accepted a tender for the work at £15,500.

Newcastle-under-Lyme T.C.—It has been agreed to pay a sum of £100 to Mr. Stephen Heath (in addition to the sum of £4,626, the amount of his tender for the erection of twenty-nine working-class dwellings on the Lower Green), in consequence of the increased price of building materials on account of the war.

Stourbridge U.D.C.—A decision has been reached to build twenty houses to relieve immediate pressure,

Surbiton U.D.C. The Local Government Board have [illegible] the proposal [illegible] for the area referred to in the Council's application, except the new cemetery site, and the land used for allotments and recreation ground. The Board has included the property of all the objectors.

Westhampnett R.D.C. Inquiries are being made as to the advisability of providing additional [illegible] several parishes.

PARKS AND OPEN SPACES.

Dumfries T.C.—The municipal bowling greens have proved a success and are self-supporting.

Hessle U.D.C.—It has been decided to lay out a recreation ground at an estimated cost of £1,000.

Rothesay T.C.—It has been agreed to extend the municipal golf course by about 1,000 yds.

REFUSE COLLECTION AND DISPOSAL.

Rothesay T.C. Notice of motion has been given for the provision of a refuse destructor.

ROADS AND MATERIALS.

Bromley R.D.C.—The council have approved the plans of the surveyor, Mr. R. Craig, for the improvement, at an estimated cost of £268, of Crofton-road at the point where it joins the main road at Locksbottom, and the clerk has been directed to apply to the Road Board for a grant towards the cost of the work.

Cardiff T.C.—The city surveyor, Mr. W. Harpur, last week reported to the Tramways Committee that the reconstruction of the tramway track in Queen-street was started on June 20th, and that 1,305 yds. had been constructed, an average of 90 yds. per week. The total cost was £5,174, or £3 19s. 3d. per yard of single track. In Ninian-road 1,068 yds. had been constructed since June 15th—69 yds. per week on an average. The total cost was £4,600—£4 6s. 2d. per yard. Mr. Harpur said that his estimate for Ninian-road was £4 8s. 9d. per yard.

Carlisle T.C.—The council have resolved to undertake the improvement of the main roads of the city by re-forming them with tar-macadam at a cost of £12,500.

Chard T.C.—The town council last week decided, on the recommendation of the Road Committee, to proceed at once with the widening of Furnham-road, and the borough surveyor, Mr. E. W. Hearn, presented plans for the improvement of the Cornhill and the widening of a portion of Fore-street, which were approved and ordered to be forwarded to the county council with the object of obtaining a grant towards the cost of the work.

Chelmsford T.C.—The scheme of the surveyor, Mr. Percival T. Harrison, for the widening of Galleywood-road, at an estimated cost of £5,000, has received the provisional sanction of the Road Board.—The contractors for the wood block paving in Duke-street, Messrs. William Griffiths & Co., Limited, wrote with reference to their contract. The work has been postponed at the suggestion of the military authorities, and they suggested that the blocks now on charge should be disposed to the council and paid for. It was agreed to pay Messrs. Griffiths £500 in respect of the blocks, and also £500 of the retention money—£617—held in connection with the High-street wood paving completed last year.

Dover T.C.—Upon the suggestion of the assistant surveyor, it has been agreed to spend this year £800 on the relaying of the Folkestone road tramways, the balance of the estimated cost—£1,200—to be spread over the next two years. The work will be done by direct labour.

East Ham T.C.—With respect to an unexpended balance of £2,000 from a loan of £8,140 granted by the Local Government Board for works of channelling, it has been agreed to ask the board to authorise this being expended for materials required to channel other roads, provided they made a grant for the work to be executed by Distress Committee workmen.

Erpingham R.D.C.—The sanction of the Local Government Board has been received to the loan for making up Hilda-road, Mundesley, and the council have authorised the clerk to negotiate for the loan.

Guildford T.C.—A letter has been received from the Road Board stating that if there was any likelihood of any considerable amount of unemployment in Guildford the board would be prepared to consider applications for grants towards works involving the employment of a maximum amount of labour. The Road Board would be prepared, in such circumstances, if the Local Government Board so advised, to consider the improvement of London-road.

Hackney B.C.—Towards carriageway and paving works estimated to cost £17,200 the Road Board have sanctioned a grant of £10,900.

Holmfirth U.D.C.—A road widening scheme estimated to cost £304 has been approved.

Ilfracombe U.D.C.—The surveyor, Mr. O. M. Proose, has received instructions to make up several streets under the Private Street Works Act.

Jarrow T.C.—The borough surveyor, Mr. J. S. Weir, has been authorised to assist the county surveyor in preparing a scheme with regard to Boldon-road for the purpose of submission to the Road Board, and that, if necessary, he should accompany the county surveyor to London to interview the board.

Knaresborough R.D.C.—It has been agreed to carry out private street works at Westminster-drive, Pannal, and Killinghall.

Lancaster T.C.—The borough surveyor, Mr. A. G. Bradshaw, submitted recently a report on various schemes which might be carried out as relief works in order to mitigate any local distress if such should arise. These schemes referred to a proposed road through Greaves Quarry, and the widening of Buck-road beyond the wagon works. The borough surveyor was instructed to communicate with the Road Board and make inquiries as to whether any grants could be obtained towards any of the proposed works in Buck Ward. The borough surveyor's estimate for the work in connection with the Greaves Quarry-road was approved.

Leicester T.C.—Road widenings and footway construction are to be carried out at an estimated cost of £22,580.

Littlehampton U.D.C. — The surveyor, Mr. H. Howard, has been instructed to prepare a list of the properties not yet connected with the sewers, in order that notices might be served requiring the work to be carried out forthwith. Mr. Harwood said it was absolutely necessary, in order that roads should not be torn up after repair, that the work should be done at once.

North Walsham U.D.C.—A letter was read from the county surveyor as to the proposed improvement and repair of the Bacton and Cromer roads for military purposes, the expense being borne by the Road Board. It was resolved that the surveyor of the council, Mr. J. W. Stevens, be instructed to assist the county surveyor in the carrying out of the work so far as it affects North Walsham.

Oldham T.C.—With the object of providing work for the unemployed, the council last week decided to apply to the Local Government Board for borrowing powers for £8,255 for improvement schemes, also for a grant from the Road Board towards the sum of £9,000, to be spent on two improvements in Rippon-den-road.

Perthshire C.C.—At a meeting recently of the Blairgowrie District Committee, it was reported that contracts had been accepted for a scheme of improvements of the Bridge of Cally road (£1,554) and on the Perth Coupar Angus road (£1,014). A letter was read from the Road Board stating that the proposal for a comprehensive scheme of road improvements, estimated at £25,000, superseded the £3,000 scheme, and that the board were not prepared to proceed with the grant of £1,500 indicated to the latter scheme.

Porthcawl U.D.C.—The tender of Messrs. Vicary Bros., of Barrow, has been accepted for private street works.

Reigate R.D.C.—The surveyor, Mr. A. J. Head, has been instructed to make up the Charlwood-lane footpath with Charlwood stone and clinker.—With respect to the supply of 100,000 gallons of tar for surface treatment, the surveyor has been advised to divide the order between three companies, and to ask for a discount in each case of 2½ per cent on monthly accounts. The Redhill Gas Company's tender was 2⅞d. per gallon, or 2⅛d. per gallon if put into the council's railway tanks; Reigate Gas Company, 3d. per gallon, less 2½ per cent discount on monthly accounts; and Horley Gas Company, 3d. per gallon.

Rhyl U.D.C.—With regard to the application of the council for permission to borrow £2,500 for further improvements on the Promenade, the Local Government Board have intimated that they would not withhold their sanction under the circumstances if the council started the work before an inquiry was held.

Stirling C.C.—It is reported that arrangements have been concluded with the Denny Town Council and the Central District Committee for the widening of part of Broad-street, Denny.

Stockton T.C.—Three important road schemes, consisting of widenings and the construction of a new road, are under the consideration of the council.

Tavistock R.D.C.—The question of purchasing a steam road roller has been referred to committee for report.

Walsall T.C.—The Streets Committee recommend the council to apply for a loan of £11,197 for the purpose of road improvement and other works.

Warrington T.C.—The Street Improvement Committee have passed a resolution to the effect that the Paving and Sewerage Committee be recommended to proceed with the re-forming and paving of Buttermarket-street, where widened, as soon as practicable. The last-named committee have considered the question, and the borough surveyor, Mr. A. M. Ker, has been instructed to bring the matter before the Tramways Committee with a view to deciding whether they require a tramway track, and that if not application be made to the Local Government Board for sanction for a loan for the repaving.

Westhampnett R.D.C.—It has been agreed to pass an estimate of £560 for tar treatment during the ensuing season.

Wolstanton U.D.C.—The surveyor, Mr. W. F. Slater, has received instructions to prepare a scheme for widening Milehouse-lane, the estimated cost of which is £2,000.

SEWERAGE AND SEWAGE DISPOSAL.

Alcester R.D.C.—Messrs. Dodd & Dodd have prepared a scheme for sewage disposal estimated to cost £2,237.

Carlisle T.C.—The Health Committee have approved an estimate at £22,000, submitted by the city surveyor, Mr. H. C. Marks, for sewerage works in the outlying portions of the city, as required by Parliament in granting the extension of the municipal boundaries.

Coalville U.D.C.—The Highways Committee are considering plans prepared by the surveyor, Mr. L. L. Baldwin, of the proposed sewer in Meadow-lane, which is estimated to cost £2,000.

Ely U.D.C.—A scheme of sewerage is to be carried out at an estimated cost of £17,000.

Irlam U.D.C.—Proposals have been made for alterations and extensions at the sewage disposal works, the cost of which is estimated at £15,000.

Romford R.D.C.—The engineer, Mr. Fairley, has received instructions to prepare an estimate of the cost of a sewerage scheme for Upminster.

Shoreham U.D.C.—The surveyor, Mr. A. W. Nye, has been instructed to obtain the necessary particulars to enable the General Purposes Committee to consider the request of the military authorities for an extension of the drainage system to improve the sanitation of the local camp.

Uwchaled (Denbigh) R.D.C.—The council have instructed Messrs. Berrington, Son & Watney to prepare a scheme of sewerage and sewage disposal for Cerrig-y-druidion.

WATER, GAS, AND ELECTRICITY.

Atherstone R.D.C.—It has been agreed to adopt a scheme prepared by Dr. Lapworth, in conjunction with Mr. H. J. Coleby, the council's engineer, for supplying the whole of the district with water from the new boring at Warton. Testing operations had proved the daily yield of the well to be 240,000 gallons, or about 90,000 gallons in excess of the requirements of the district. The total estimated cost of the scheme is £18,158.

Barnstaple R.D.C.—It is announced, in reference to Combemartin water scheme, that Mr. Luke, the engineer, has very much modified his plans as to the quantity of land wanted. Instead of purchasing 51 acres, only just over 8 acres will now be required. The clerk has received instructions to make inquiries in connection with the smaller scheme, and to forward the replies to the parish council for their views.

Clogher R.D.C.—The medical officer of health, Dr. H. Warnock, calls the attention of the council to the pressing need of a proper water supply.

Coleraine U.D.C.—The surveyor has been instructed to prepare a plan and estimate for the construction of a covered storage tank, 60 ft. by 60 ft., at Ballyversal reservoir.

Downpatrick R.D.C.—An arrangement has been reached with a local company to light the streets by electricity.

Holywood U.D.C.—It is proposed to provide temporary means of water storage pending the construction of the reservoir, for which Parliamentary powers have been obtained.

Hove T.C.—The council have adopted the recommendation of the General Purposes Committee to carry on the electricity undertaking as a municipal concern.

Kidderminster R.D.C. — The council last week approved an agreement with the Stourbridge and District Water Board for a supply of water to the parish of Churchill for thirty years at 9d. per 1,000 gallons. The clerk said he had asked the Local Government Board to expedite the carrying out of the scheme, and that of Wribbenhall water supply, so that the work could be done while there was necessity to find employment for those who were out of work.

Kirkintilloch T.C. — An engineer has received instructions to report on a proposed site for an additional reservoir at Auchenmony.

Lisburn U.D.C.—A resolution has been passed confirming the purchase of additional land for waterworks purposes, and a statement was made showing that at present the reservoir was being excavated and that negotiations are proceeding relative to obtaining an increased supply to guard against the possibility of a shortage in the future.

New Mills U.D.C.—The Gas Committee have adopted a proposal for a new gasholder estimated to cost £7,000.

Plymouth T.C.—The Water Committee have had referred back to them a proposed scheme for increasing the means of conveying water between Burrator and Roborough reservoirs, which is estimated to cost £60,000.

Poole T.C.—The question of the provision of a reservoir has been deferred, and instead it has been decided to take steps to provide such additional pumping capacity as may be necessary.

Richmond R.D.C.—The council proposed to postpone the water supply scheme for Newsham owing to the war, but the Local Government Board wrote that they did not consider the council would be justified in doing so for the reason stated. The council, in the circumstances, have resolved to proceed with the scheme.

Sheffield T.C.—The question is being considered of building an electric supply centre in Bow-street, at an estimated cost of £42,000.

St. Pancras B.C.—Renewals of electricity cables and feeders are to be provided at an estimated cost of £5,900.

Stirling C.C. Negotiations have been opened up with a view to the formation of a combination of water authorities, subject to the preservation of the existing interests of the various bodies concerned.—It has been referred to the Water Commissioners to consider the advisability of providing additional storage accommodation on the Touch Hills.

Uwchaled (Denbigh) R.D.C.—The council have in hand the question of providing an efficient water supply for Cerrig-y-druidion, and have instructed Messrs. Berrington, Son & Watney to report as to the best means of supply.

MISCELLANEOUS.

Flintshire C.C. Negotiations have been opened with the Development Commissioners with the object of securing a grant of £20,000, free of interest or repayment of capital, for the Mid-Flintshire light railway scheme.

Southwold T.C.—Several schemes have been prepared for providing employment, including a scheme

[illegible] appointed to advise with the borough surveyor, Mr. J. S. Hurst, on the schemes and report to the council. [illegible]

Twickenham U.D.C. It has been decided, subject to the consent of the Local Government Board, to let on the usual terms the ground at the rear of the Clifford Works for a rifle range, at a rental of £8 per annum. The council will erect the necessary fencing at an estimated cost of £75, and will construct the range at the cost of the club.

PERSONAL.

Mr. William Boyd has been appointed assistant road surveyor to the Cupar District Committee of the Fifeshire County Council.

Mr. A. G. Knight, assistant sanitary inspector to the Twickenham Urban District Council, has been granted sick leave of absence for a period, if necessary, of six months.

Mr. A. E. Adams, borough surveyor of Chippenham, has been voted £100 for his services in connection with the filtration and aëration of the water supply, and the housing scheme.

Mr. D. H. P. Stevenson, of Nottingham, has been appointed surveyor and inspector of nuisances to the Leake Rural District Council during the absence of Mr. O. G. Laban on active service.

Mr. I. E. Williams, of the borough surveyor's department, Pwllheli, has been appointed surveyor and inspector to the Criccieth Urban District Council during the absence of the surveyor, Mr. G. H. Williams, on military service.

Mr. J. S. Coverley, formerly surveyor to the Penmaenmawr Urban District, died on the 6th inst., we regret to state. After he had retired from the office of surveyor, Mr. Coverley was elected a member of the council for many years, and he was for one year chairman.

Dr. P. Langdon-Down and Mr. M. Hainsworth, respectively chairman and surveyor of the Teddington Urban District Council, were on Monday authorised to obtain clerical assistance in the surveyor's office during the absence of Messrs. Firman & Tuffin, who have joined the Territorial Forces.

Mr. G. J. Griffiths, the chief engineer of the Thames Conservancy Board, who has been called up on active service, is, it was agreed on Monday, to be paid his full salary during the time he serves with the forces, "in view of the services he has rendered to the board in the past and of the extra expenses to which an officer in the forces is necessarily put."

Disinfecting Apparatus.—A correspondent asks for the names of makers of disinfecting apparatus.—Address "A," c/o The Editor.

Municipal Map of London.—A municipal map of London, prepared under the authority of the London County Council, is ready for publication. The map, the agents for which are Messrs. P. S. King & Son, is in sets of twenty-eight sheets, with a key sheet, and the price of the set is 31s. nett, separate sheets being sold at 1s. 3d. nett each. There is also an index to the map, the price of this being 2s. nett.

FOR OTHER ADVERTISEMENTS

See End of Paper.

COUNTY BOROUGH OF BOLTON.

The Corporation invite applications for the position of Junior Surveying Assistant, with municipal experience, in the Borough Engineer and Surveyor's Department.

Salary commencing at £65 per annum.

Applications, in candidate's own handwriting (endorsed "Junior Assistant"), stating age, qualifications and experience, together with copies of three testimonials of recent date, which will not be returned, to be delivered to the undersigned not later than Monday, the 26th instant.

Canvassing, directly or indirectly, will be considered a disqualification.

SAMUEL PARKER,
Town Clerk.

Town Hall, Bolton.
October 14, 1914. (2,016)

COUNTY COUNCIL OF THE WEST RIDING OF YORKSHIRE.

The West Riding Highways Committee invite applications for the post of Assistant Surveyor in the office of the West Riding Surveyor.

Applicants must have had good practical experience in road construction, particularly in respect of the use of tar-macadam, tar-grouting, foundation work, road widenings, &c. A sound knowledge of surveying and levelling is also necessary, and, in addition, applicants must be neat and accurate draughtsmen.

Salary, £150 per annum.

The successful candidate will be required to devote the whole of his time to the duties of the office.

Applications (on form to be obtained from the undersigned), accompanied by not more than three recent testimonials, to be delivered at the office of the West Riding Surveyor not later than 10 a.m. on Monday, the 2nd of November, 1914.

Canvassing will disqualify.

F. G. CARPENTER,
West Riding Surveyor.

County Hall,
Wakefield.
October, 1914. (2,017)

DOCKING RURAL DISTRICT COUNCIL.

APPOINTMENT OF SURVEYOR OF HIGHWAYS.

The above Council invite applications for the post of Highway Surveyor for their Eastern District, comprising 19 Parishes, with 120 miles of Road.

The salary will be at the rate of £80 per annum, inclusive of travelling and other expenses (except books, stationery, and postages).

The person appointed will be required to give approved Security in the sum of £100 for the due performance of his office, and will be required to devote the whole of his time to the duties of the office.

Applicants must have a practical knowledge of Road Making and Maintenance, including Steam Rolling and the management of a Steam Roller, and of the duties appertaining to the office of Surveyor of Highways, and be able to keep the necessary books and accounts.

Applications, in candidate's own handwriting, stating age, qualifications, present occupation, and previous experience, accompanied by copies of three testimonials of recent date, must be delivered to the undersigned not later than Tuesday, October 27th, 1914.

Canvassing will be deemed a disqualification.

J. A. STOUGHTON,
Clerk.

Fakenham,
Norfolk.
October 14, 1914. (2,014)

COUNTY BOROUGH OF HUDDERSFIELD.

ENGINEERING AND SURVEYING ASSISTANT.

The Corporation invite applications for the appointment, in the Borough Engineer's Department, of a Temporary Engineering and Surveying Assistant, at a salary of £120 per annum.

The person appointed must be thoroughly qualified to fulfil the duties of the office, particulars of which may be obtained on application to the Borough Engineer.

Application, in candidate's own handwriting, giving full particulars as to experience, age, present and previous appointments, accompanied by not more than four recent testimonials, to be addressed to me, the undersigned, not later than ten a.m., the 28th October, 1914.

Canvassing will disqualify.

K. F. CAMPBELL, M.INST.C.E., M.I.E.E.,
Borough Engineer and Surveyor.

Huddersfield.
October 14, 1914. (2,015)

SHEFFIELD SEWAGE DISPOSAL SCHEME.

PROPOSALS FOR SECONDARY TREATMENT.

On Wednesday the 7th inst. a proposal of the Sheffield Corporation to extend its sewage disposal works at a cost of £70,000 was the subject of a Local Government Board inquiry held by Mr. R. C. Hetherington, M.INST.C.E. Secondary treatment of the sewage is proposed in order to bring the final effluent quite within the requirements of the West Riding Rivers Board, and to be in accord with the local proposals of the Royal Commission on Sewage Disposal.

Mr. C. F. Wike, M.INST.C.E., the city engineer and surveyor, said the scheme prepared in 1904 estimated the cost at £270,000. The new proposals, exclusive of land, amounted to £262,000. Proceeding to describe the present scheme, Mr. Wike stated that experiments have been carried on for some time past, and that after full investigation it has been found that a good treatment of the present effluent is a percolating filter, followed by settling tanks, a humus tank, whose entirety removes the colloidal and suspended matters. The treatment at the rate of over 1,000 gallons per cubic yard has been found to be quite efficient, but the present proposal is now for a much lower rate than that.

The proposals now submitted to the Local Government Board consist of: Pumping station, bridge over the river Don, main feed conduit, filter-beds, humus tanks, outfall culvert, roads, railways, and other ancillary works.

The pumping station will be erected on the west side of the river near the present primary effluent outfall culvert. Here the pumphouse or pump well will be constructed, and to this the effluent culverts from the contact beds will be connected. A modern pumping plant capable of lifting 15,000,000 gallons per day to the required height will be installed. The outfall culvert, from the storm beds will also be connected to the pump-well, by means of culverts with penstock control, so that the effluents from these beds, when working as contact beds, can also be passed forward for secondary treatment. A bridge will be constructed to give access from the present disconnected area to the Holmes Farm estate. From the pump-well the effluent will be lifted into a 9-ft. conduit which will be carried over the river with the proposed bridge as one structure, and thence continued in a straight line on to and across the Holmes estate.

The percolating filter-beds will be situated south of the conduit and served by it, and will occupy an area of 9·07 acres, and be 6 ft. 3 in. deep with a maximum capacity for treating 45,000,000 gallons of effluent per day at the rate of 500 gallons per cubic yard of media. The floor will be constructed of concrete suitably graded, with the necessary effluent drains and channels, and the filtering media will be slag or clinker of large and medium grade. Provision has been made in the estimates for distributors for sprinkling the effluent over the media. On leaving the filter-beds the effluent will pass to the humus tanks by means of culverts, as shown on the plan.

The humus tanks are six in number, with a total capacity of 2,500,000 gallons, equivalent to a four hours' flow when the dry-weather rate of 15,000,000 gallons per day is passing through the filter-beds. The tanks are similar in construction to the new settling tanks which are working so satisfactorily. A small pump-house will be provided at the end of the humus tanks for emptying the tanks and removing the humus which it is proposed to treat on the adjoining land. On its way from the tanks to the outfall the effluent will pass through a gauging chamber, where the quantity receiving secondary treatment will be registered. The necessary roads, railways and electric lighting of the site are provided for.

In laying out the scheme, special regard has been given to the development of the whole of the site, so that future extensions may be arranged and carried out in a uniform manner at the minimum cost; the main conduits will also be made large enough for this purpose. The levels have been so arranged as to ensure absence of flooding at the highest recorded rise of the river. Practically the whole of the works are designed to be constructed in brick and concrete.

The total estimated cost of the scheme as described is £70,000.

The filter-beds are designed for rectangular distributors, as such an arrangement occupies the minimum ground area and is least costly so far as the mechanical work is concerned.

The scheme as now presented has been prepared after carefully reconsidering whether a gravitation scheme is possible.

The present proposal for secondary treatment provides 90,000 cub. yds. of filters. Experiments and practice have shown that only a slight treatment is needed to ensure the primary effluents being brought well within the required standards, and extremely high rates of filtration have proved quite effective. It has, however, been considered desirable to provide ample accommodation. Taking the dry-weather flow of 13,500,000 gallons of real sewage, 1 cub. yd. for each 150 gallons is provided, or on the gauged flow of 15,000,000 gallons, 1 cub. yd. for each 166⅔ gallons is available. In wet weather, taking three times the 10,000,000 gallons of domestic sewage and 1½ times the 3,500,000 gallons of trade wastes, a total of 33,850,000 gallons per day must be dealt with; therefore 1 cub. yd. is provided for each 376 gallons, whereas the experiments have shown that more than twice this volume of primary effluent, even from the strong, dry-weather sewage, can be effectively dealt with. The humus tanks are also adequate, having a capacity of 2,500,000 gallons, or ⅛th the gauged dry-weather flow, including the fresh and subsoil waters.

The city engineer is of opinion that the works proposed will amply serve the purpose required, and produce effluents in compliance with the most exacting requirements. At last week's inquiry, Dr. Wilson, for the West Riding Rivers Board, said they were quite convinced of the necessity for the works. Although in the winter the effect of the effluent on the river Don was not very marked, in the summer it caused an offensive nuisance. It was an excellent scheme, and would produce an excellent effluent.

SURVEYORS' INSTITUTION EXAMINATIONS.

After the examinations of March, 1915, a paper on the subject of "Heating and Ventilation" will be included in the Building and Quantities Section of the Intermediate Division.

Papers on the "Principles of Valuation and Use of Valuation Tables" will be included in the Final and Direct Fellowship Examinations, Sub-divisions I. and III. The paper on "Agricultural Chemistry" in the Final Examination, Sub-division I., will be dropped, and the scope of the paper on that subject in the Intermediate Examination will comprise Parts 1, 2, 3 and 4 of the existing syllabus.

The first ordinary general meeting of the session 1914-15 will be held on Monday, November 9th, when the president, Mr. Howard Chatfeild Clarke, will deliver an opening address. The chair will be taken at 8 o'clock.

Pudlo at Lewes.—The firm of civil engineers who have had the work in connection with the Lewes sewage works report that all experiments that they made with the powder Pudlo, for making cement waterproof, were perfectly successful.

London and Lancashire Fire Insurance Company.—The directors of the company have decided to pay, on the 2nd proximo, an interim dividend of 14s. per share, less Income-tax (as compared with last year's interim dividend of 12s. per share, less Income-tax).

Morris Double-speed Bottom-block.—Messrs. Herbert Morris, Limited, Empress Works, Loughborough, have brought to our notice an invention for speeding-up the lifting of loads on cranes and other lifting gears. This invention is a two-speed bottom chain block, which provides a fast speed for the quicker handling of loads up to half the capacity of the gear, while the heavier loads are lifted in the usual manner. The block is made with an attachment for linking on to the "live" side of the chain, which then takes the load up at double the normal speed. It can be adapted to practically any make of crane or travelling gear lifting on the double chain. In ordinary practice it is found that most loads are under half the capacity of the gear. Messrs. Morris' arrangement will therefore speed-up most of the work, and should save its cost many times over in a very short while.

STORES CONTRACTS.

EFFECT OF THE WAR.

[illegible] the contracts were entered into.

[illegible] full obligations under their contracts, and the committee [illegible] similar expenses, and in others they are unable to supply owing to the impossibility of obtaining further stocks, or for other reasons. In some of these cases the committee have terminated the contracts, and are obtaining supplies as and when required under special quotations pending the making of new contracts, and [illegible] tractors special arrangements which they think are equitable for dealing with the situation. Each case is considered on its merits, and any special arrangements made, of course, only apply to orders given after a new and serious condition of affairs not contemplated in the contract has actually arisen.

From time to time tenders or quotations for the supply of stores, &c., from firms controlled wholly or largely by persons of German or Austrian nationality have been accepted. After making the necessary inquiries in each case, the committee are arranging, if the facts justify that course, to have no further dealings with the firm in question.

INSTITUTION OF MUNICIPAL ENGINEERS.

President Mr. Horace Boot, M.I.E.E., M.I.Mech.E.

Meetings will be held at Newcastle on Saturday, November 7th, and December 12th.

B. Wyand,
39 Victoria-street, S.W. *Secretary.*

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

SURVEYOR'S ASSISTANT.—October 17th.—East and West Molesey Urban District Council. £80 per annum.—Mr. J. Stevenson, surveyor.

INSPECTOR OF NUISANCES.—October 20th.—Romford Urban District Council. £2 2s. per week.—Mr. C. T. King, clerk.

ENGINEERING ASSISTANT.—October 21st.—Neath Rural District Council. £90 per annum.—Mr. D. M. Davies, engineer.

TEMPORARY ENGINEERING AND SURVEYING ASSISTANT.—October 21st.—Corporation of Bootle. 35s. per week.—Mr. B. J. Wolfenden, borough engineer and surveyor.

TEMPORARY ENGINEERING ASSISTANT.—October 22nd.—Corporation of Nottingham. £140 per annum.—Mr. Arthur Brown, city engineer.

SURVEYOR'S TEMPORARY ASSISTANT.—October 23rd.—Corporation of Salisbury. £150 per annum.—Mr. Francis Hodding, town clerk.

JUNIOR ENGINEERING AND SURVEYING ASSISTANT.—October 23rd.—Corporation of Newport (Mon.). £75—£104 per annum.—Mr. H. Tremelling, borough engineer.

CLERK OF WORKS.—October 23rd.—Corporation of Eccles. £150—£200 per annum.—Mr. E. Parker, town clerk.

TEMPORARY ASSISTANT SURVEYOR. October [illegible]. Dorset County Council. £150 per annum. Mr. E. A. Ffooks, clerk, County Offices, Dorchester.

CLERK OF WORKS. October 24th. Llandilo Rural and Amroth Rural District Councils.—Mr. T. M. Evans, clerk to the Joint Bridge Committee.

SURVEYOR.—October 24th.—Llandyssul Rural District Council.—Mr. J. Evans, clerk, 12 Lincoln-street, Llandyssul.

SANITARY INSPECTORS. October 26th. Finsbury Borough Council. £150 to £200 per annum.—Mr. G. W. Preston, town clerk, Town Hall, Rosebery-avenue, E.C.

ARCHITECTURAL ASSISTANT. October 26th. Corporation of Ealing. £2 10s. per week.—Mr. W. R. Hall, Town Hall.

SURVEYOR'S ASSISTANT. October 27th. Atherton Urban District Council. £2 per week.—Mr. William Garnett, clerk.

HOUSING INSPECTOR.—October 28th.—Scarborough Rural District Council. £80 per annum.—Mr. J. W. Read, clerk, 14 Dean-road, Scarborough.

TEMPORARY SURVEYOR AND INSPECTOR. October 28th.—Swaffham Urban District Council.—Mr. Alfred J. Winter, clerk.

ASSISTANT SURVEYOR.—October 29th.—Antrim County Council. £125 per annum.—Mr. A. Millar, deputy secretary, County Court House, Belfast.

INSPECTORS.—October 31st.—Rhymney Valley Sewerage Board. £2 10s. to £3 per week. Messrs. Chatterton & Alford, 9 Victoria-street, Westminster, S.W.; or Messrs. Willcox & Raikes, 63 Temple-row, Birmingham.

TEMPORARY ASSISTANT.—October 31st.—Somerset County Council. £3 3s. per week.—Mr. Edward Stead, county surveyor, Wells, Somerset.

INSPECTOR OF NUISANCES.—October 31st.—Cowbridge Rural District Council. £90 per annum.—Mr. J. Stockwood, clerk, Cowbridge, Glamorgan.

SEWAGE WORKS MANAGER.—November 10th.—Corporation of Dewsbury. £400 per annum.—Mr. H. Ellis, town clerk.

JUNIOR DRAUGHTSMAN AND SURVEYOR.—Derbyshire County Council. £80 per annum.—The County Surveyor, County Offices, Derby.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

ST. HELENS.—October 31st.—Drawings of police buildings and fire station, for the St. Helens Corporation. Premiums, £100, £50, and £25.—Mr. A. W. Bradley, borough engineer.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

BEVERLEY.—October 17th.—For additions to lunatic asylum, for the Asylum Committee.—Mr. J. Bilson, architect, 23 Parliament-street, Hull.

LEICESTER.—October 17th.—For the supply and erection of steel plate girders and steel troughing, and the widening of Bow Bridge over the river Soar, for the corporation.—Borough Surveyor.

COSFORD.—October 17th.—For the construction of a brick tower, laying water mains, standpipes, valves, and other works, for the rural district council.—Mr. C. Dudley Bright, Polstead Heath, Polstead, Suffolk.

NORTHUMBERLAND.—October 17th—November 2nd.—For the erection of a school, for the Education Committee.—Mr. C. Williams, secretary, The Moothall, Newcastle-on-Tyne.

ERPINGHAM.—October 17th.—For making up a road, for the rural district council.—Mr. R. Mann, surveyor, Cromer-road, Holt, Norfolk.

GODSTONE.—October 17th.—For the erection of ten working-class dwellings, for the rural district council.—Mr. T. C. Barralet, surveyor.

BLACKBURN.—October 19th.—For the erection of a fire station and firemen's dwellings, for the corporation.—Mr. W. Stirrup, 14 Richmond-terrace.

SIDMOUTH.—October 19th.—For the erection of forty-eight cottages, for the urban district council.—Mr. R. W. Sampson, architect, Manor Offices, Sidmouth.

LONDON.—October 19th, November 2nd.—For the erection of new offices, for the Metropolitan Water Board.—Mr. H. Watkins, 13 Gray's Inn-square, W.C.

SHEFFIELD.—October 19th.—For the enlargement of a school, for the Education Committee.—City Architect, Town Hall.

ROMFORD.—October 20th.—For the supply of 600 tons of granite, for the urban district council.—Mr. H. T. Ridge, surveyor.

SOUTHAMPTON.—October 20th.—For the construction of a covered reservoir, for the corporation.—Waterworks Engineer, 33 and 35 French-street, Southampton.

LONDON.—October 20th.—For the erection of buildings for motor lorries, for the county council.—Superintending Architect, County Hall, Spring-gardens, S.W.

SOUTHEND.—October 20th.—For works of improvement at the pier, for the corporation.—Mr. E. J. Elford, borough engineer.

LONDON.—October 20th.—For the extension of engine-house, boiler-house, coal store, and other works, for the county council.—Chief Engineer.

MANCHESTER.—October 21st.—For the restoration of the embankments of the Audenshaw reservoirs, for the corporation.—Messrs. G. H. Hill & Sons, Albert Chambers, Albert-square, Manchester.

HACKNEY.—October 22nd.—For the construction of a strong-room, for the borough council.—Mr. N. Scorgie, borough engineer and surveyor.

STOCKPORT.—October 22nd.—For the erection of a stable and cart shed, for the corporation.—Mr. J. Atkinson, borough surveyor.

SHEFFIELD.—October 22nd.—For the erection of public baths and wash-houses, for the corporation.—City Architect, Town Hall.

IPSWICH.—October 22nd.—For the erection of public health offices, for the corporation.—Mr. J. R. Mead, borough engineer and surveyor.

MANCHESTER.—October 22nd.—For wall and floor tiling, for the corporation.—The City Architect, Town Hall.

MERTON.—October 23rd.—For alterations to the council chamber, for the urban district council.—Mr. G. Jerram, surveyor.

SLIGO.—October 24th.—For the construction of a water supply, for the rural district council.—Mr. M. F. Conlon, clerk, Courthouse, Sligo.

FAVERSHAM.—October 24th.—For laying cast-iron pumping main, supply mains, with all necessary fittings, and the construction of a new reservoir, for the rural district council.—Mr. H. Howard Humphreys, 28 Victoria-street, Westminster, London, S.W.

METROPOLITAN BOROUGH OF GREENWICH.

TUBERCULOSIS DISPENSARY.

TO BUILDERS AND CONTRACTORS.

The Council of the Metropolitan Borough of Greenwich is prepared to receive Tenders for the Erection of a Tuberculosis Dispensary at Maze Hill, Greenwich, according to the Drawings, Specification and Conditions of Contract, which may be seen at the Office of the Architect, Mr. Alfred Roberts, F.R.I.B.A., 92 London-street, Greenwich, on and after Tuesday, 13th October instant, between the hours of 10 a.m. and 4 p.m. (on Saturday between 10 and 12). Those desirous of tendering may obtain copies of the Drawings and Specification from the Town Clerk, Town Hall, Greenwich-road, between the above-mentioned times, upon payment of a deposit of Two Guineas, which will be returned to persons sending in a *bonâ-fide* Tender.

Tenders, on the Form to be supplied, sealed up and endorsed "Tender for Dispensary," must be delivered to the Town Clerk not later than 10 a.m. on Monday, 2nd November, 1914.

Tenderers will be required to sign a declaration that they pay such wages and observe such conditions as are considered fair in their trades.

The lowest or any Tender will not necessarily be accepted.

The Council reserve the right before a Tender is accepted of requiring the Tenderer to satisfy them or their Architect as to the nature and quality of work previously carried out by him.

FRANCIS ROBINSON,
Town Clerk.

Town Hall, Greenwich, S.E.
October 8, 1914. (1,992)

COUNTY OF WEST SUSSEX.

ROADS AND BRIDGES COMMITTEE.

TENDERS FOR MATERIALS AND CARTAGE.

The Roads and Bridges Committee are prepared to receive Tenders for the Supply of—

(1) Broken Granite, Quartzite, or other approved Stone and Chippings, also Tarred Macadam, to Harbours and to Railway Stations.

(2) Picked Surface Flints and Pit Flints, also Sand suitable for Surface Tar Treatment, or Binding Material, delivered on the Main Roads and to Railway Stations.

(3) Cartage from Railway Stations, Wharves and Stone Pits to Main Roads.

(4) Team Labour.

For the year ending 31st March, 1916.

Forms of Tender may be obtained on application to the undersigned, and applicants are requested to state which Form of Tender (1, 2, 3, or 4) they require.

Applications for Tender Forms should be accompanied by a stamped addressed foolscap envelope.

Sealed Tenders, endorsed "Tenders for Materials," or "Tenders for Cartage," to be delivered to the undersigned on or before 7th November, 1914.

The Committee do not bind themselves to accept the lowest or any Tender.

H. W. BOWEN, M.INST.C.E.,
County Surveyor.

County Surveyor's Office,

County Surveyor.

North-street,
Horsham. (2,002)

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. OCTOBER 23, 1914. No. 1,188.

Minutes of Proceedings.

Extraordinary Traffic: Who is Liable?—(I.)

Few questions in connection with the subject of extraordinary traffic are more important than that of the incidence of the liability for the damage. And there are few which have been more frequently contested. The Highways and Locomotives Amendment Act, 1878, puts the liability on "any person by whose order" the traffic has been conducted. As a general rule there is no difficulty in the application of this designation to a builder or other contractor who has by himself or his servants carted materials in the fulfilment of a contract with another party. The difficulty has usually arisen when for any reason it has been thought that a judgment against the other party is more likely to prove fruitful than one against the contractor, and proceedings have accordingly been taken against the former. That difficulty has, it is true, been somewhat diminished since the passing of the Locomotives Act, 1898, by section 12 of which the words "by or in consequence of whose order" were substituted for the words "by whose order." But, as we shall see, the amended phrase has not altogether cleared the air. This enactment was the result of the decision of the House of Lords in the well-known case of *Kent County Council* v. *Lord Gerrard* (1897 A.C., 633). In that case Lord Gerrard invited and obtained tenders from various tradesmen to supply and deliver at his residence building materials of various kinds. No mode of delivery was specified, but as a matter of fact the only practicable method was (as Lord Gerrard knew) by traction engines. No contract was made for the supply by any one tradesman of a definite quantity of materials, but orders were given from time to time as occasion required to those tenderers whose samples and quotations were approved. It was held that Lord Gerrard was not liable for the extraordinary traffic caused by the carriage of the materials. Several of the Lords of Appeal pointed out that the words of the Act (of 1878) were "by whose order," and not "in consequence of whose order."

The amendment effected by the Act of 1898 was intended, of course, to meet similar cases, and, without relieving those who actually conducted the traffic, to impose liability also upon the person whose order set them in motion. And at first it was generally understood that this intention had been effectuated by the Act. But it was not long before the proverbial "coach and four" appeared in the case of *Egham Rural District Council* v. *Gordon* (1902, 2 K.B., 120). To the plain man the facts in that case would appear to be for all practical purposes on all fours with those in the Gerrard case. Mr. Gordon ordered a quantity of bricks from a brick company to be delivered at the site of a house which he was building. As in the Gerrard case, no mode of delivery was specified, and as in that case traction engines were used for the purpose. In short, it seemed precisely the case to meet which the clause was inserted in the Act of 1898. It must therefore have come somewhat as a shock to the council and their advisers when the County Court Judge decided that Mr. Gordon was not liable. "The traffic" (such in effect was the judgment) "was conducted not in consequence of any order given by the defendant, but in consequence of the brick company having thought fit to choose this particular method of delivery." The decision was affirmed by the Divisional Court, who seem to have been as much exercised to discover the true meaning of the phrase "in consequence of whose order" as the judges in earlier cases were in construing the words "by whose order." Mr. Justice Darling paraphrased "in consequence of" into "as a *necessary* consequence of," thus toning the clause down to fit the facts of the case under consideration. The learned judge, however, subsequently modified his opinion on this point, and adopted what we venture to think is a more reasonable interpretation, and one which has been approved by the Court of Appeal. We must, however, defer any further consideration of the question to a future occasion.

* * *

The Duty to Demolish.

The change of policy in regard to the closing and demolition of insanitary property which was effected by the passing of Part I. of the Housing, Town Planning, &c., Act, 1909, was principally directed to ensure more vigorous action on the part of the local authorities and to strengthen their hands in dealing effectively with an admitted evil. It will be remembered that under the

Housing of the Working Classes Act, 1890 a closing order had to be made by a court of summary jurisdiction upon a summons under the nuisance sections of the Public Health Act, 1875, and an appeal against the decision of the magistrates lay to Quarter Sessions. Further, a closing order having been made and not determined, the local authority were empowered to make a demolition order if they were of opinion that the dwelling-house in question had not been rendered fit for human habitation, and that the necessary steps were not being taken with all due diligence to render it so fit, and that its continuance was dangerous or injurious to the health of the public or of the neighbourhood. An appeal also lay to Quarter Sessions against a demolition order so made. Under the Act of 1909 this procedure was completely changed, and the duty of making both closing and demolition orders now rests upon the local authorities, an appeal lying against their decision, not to Quarter Sessions, but to the Local Government Board. Although the practical result of the new procedure has been to secure the closing, demolition, or improvement of a large amount of insanitary property, this has not been achieved without some legal battles of considerable importance. Our readers will, no doubt, call to mind the case of *Rex* v. *The Local Government Board (ex parte Arlidge)*, in which a property owner unsuccessfully attempted to challenge the procedure of the board in connection with the public local inquiries which are directed by the Act to be held prior to the dismissal of any appeal.

Another important question was decided in the High Court last week upon a case stated by the Local Government Board in the course of an appeal to them against certain demolition orders which had been made by the Burnley Corporation in the following circumstances. The Act provides in terms that, if the local authority are of opinion at the expiration of the prescribed period that a dwelling-house in respect of which a closing order has been made has not been rendered fit for human habitation, and that steps are not being taken to render it so fit, they *must* order its demolition. In the case under consideration, closing orders in respect of six houses had been made by the Burnley Corporation, and subsequently the houses had been sold for the purpose of converting them into warehouses. To this end certain internal alterations had been carried out, and there had been deposited plans from which it appeared that the owner intended to demolish the whole of the buildings save the external walls, and to convert the six dwelling-houses into two warehouses. Meanwhile, however, demolition orders had been made, and the plans were consequently disapproved on the ground that they showed an intention to retain and alter buildings which had been ordered to be demolished. In these circumstances the Local Government Board asked the opinion of the Court as to whether when a closing order has been made, and the local authority is satisfied either that there is no intention on the part of the owner to use the house as a dwelling-house, or that the house has been so altered as to become incapable of such use, the local authority is either entitled or bound to make a demolition order. To this the Court replied that a demolition order *must* be made under the Act. The apparent hardship of this decision was mitigated, however, by the answer given to a further question which was included in the case. The Act provides that on an appeal to the Local Government Board, the board may make such order in the matter as they think equitable, and it was held that, under this provision, they have power, in spite of the fact that the local authority are *bound* to make a demolition order, to quash or vary such order, or to make such other order as they may consider equitable in the circumstances of the particular case. It will be seen that the effect of this decision is to place very considerable power in the hands of the board, the wise exercise of which, however, will result in the mitigation of the hardship which would have resulted from a strict enforcement of the provisions of the Act.

* * *

Town Planning and Democracy.

The establishment of a department of town planning in connection with the London University School of Architecture has already been noticed in these columns, and we now have to record its public inauguration on Thursday of last week, when Prof. Adshead, the chief of the department, delivered a most interesting lecture on "The Democratic View of Town Planning." There is nothing new under the sun, and town planning in one form or another has existed through the centuries. Starting with the primitive site planning of the ancients, its development may be traced through the axial approach planning, of which France affords such excellent examples, and the comprehensive estate development of the great landowners in the eighteenth century. The modern problem, however, is both different in character and wider in extent than that which confronted the town planner of former times, for it is concerned not only with the planning of cities and the development of estates so as to satisfy the landowner, but in securing that in future all the varying needs and interests of a complex democracy shall, as far as practicable, be satisfied. In this connection an account which Prof. Adshead gave of the growth of Oldham was of great interest. Originally, its development was due to a prolific water supply available for power production. The result was that in the days before by-laws it became rapidly overrun with mills and rows of cottages arranged with little regard for hygiene, and less for appearance. With the subsequent advent of by laws a new phase of development set in, and rows upon rows of stereotyped cottages made their appearance, so that not only the dwellings, but the very existence of the people became standardised. Thus, the town is a great example of sporadic growth under the ægis of an all-pervading industrialism. Latterly, however, a garden suburb has been laid out. Squalid blocks of insanitary property have been erased, and parks, playing fields, and children's playgrounds have been laid out in their place. Thus, once lovely glens, half-choked with the refuse of a century, have been opened out and reclaimed. Here is a capital illustration of the aims and objects of democratic town planning, and Prof. Adshead is to be congratulated upon the success with which, in his inaugural lecture, he struck a note which augurs well for the success of the department over which he presides.

* * *

The Erpingham Housing Loan.

An economic problem in connection with the housing question, which raises a question of importance to small authorities, came this week before the Erpingham Rural District Council. The council in June last agreed with the Public Works Loans Board to a loan of £720 for the purchase of land and the building of four houses thereon. The erection of the houses has been nearly completed, and the council had announced their intention of taking up the loan. They have meanwhile received an announcement that the rate of interest has been advanced to 4 per cent. This means a further charge of 15s. per annum for each cottage, and at the end of sixty years an aggregate difference in the repayment of £178,

which is, it appears, equivalent to the original cost price of the house and garden. As the prospective tenants are too poor to pay what is termed an economic rent, the charge must perforce fall upon the rates. On being appealed to, the Local Government Board were unable to give the council anything but a poor comfort. They cannot regard the money as earmarked at the pre-war rate of 3½ per cent. because, as they explain, the matter is one for the Public Loan Commissioners and the Treasury to decide. These authorities will doubtless be appealed to in due course, and it is to be hoped that they will be able to come to the rescue of the council, though as to this there is, of course, no assurance that they will or can. All the same, such a state of things is disappointing and unsatisfactory, as it will tend obviously to retard cottage building in the rural districts, where the difficulties are already sufficient without being increased by financial dislocation.

* * *

Prevention of Unemployment.

A fund, the administration of which is in the hands of a sub-committee of the Architects' War Committee, has been started with the object of providing work for architects whose means of livelihood are practically stopped by the war. The sub-committee are occupied in evolving schemes of a useful nature by which those in distress may be temporarily employed, and in appealing for financial support from the architectural profession. Architects in actual need of employment in consequence of the war are invited to submit their cases to the honorary secretary at 28 Bedford-square, W.C. These cases will be considered by a sub-committee in strict confidence. Suggestions are invited for schemes of a useful nature by which architects may be temporarily employed. It is proposed, for instance, that small fees might be offered for measured drawings of buildings of architectural or historical interest, or for civic survey work. It is hoped to enlist the co-operation of architectural and other societies, so as to give effect to these proposals. An urgent appeal for help is made to those in sympathy. The fund in hand can only be regarded as a nucleus, and if the services to be rendered are to be as far reaching as it is hoped, a generous support must be forthcoming from all who realise the present opportunity as an exceptional one for undertaking such suggested work throughout the country. It should be made clear that the main object of the sub-committee is not to distribute benevolent aid, but to provide architects with temporary work of such a character that at the termination of the war their work would be of a distinct value to the community.

* * *

The Lowest Tender.

Whatever practical reasons can be advanced in favour of local authorities, who are using public money, accepting the lowest tender when making contracts, we believe we are right in saying that there is no legal obligation upon them to do so, even in the absence of the usual clause in the advertisement that "the council do not bind themselves to accept the lowest or any tender." The true view is that an advertisement asking for tenders is really an invitation to contractors to submit offers, and that no contract is completed until one of these offers—not necessarily the lowest—is accepted. Nevertheless, the acceptance of the lowest tender has come to be regarded as so usual that the adoption of any other course can only be justified by some sufficient reason. In letting a contract for drainage work, the Uckfield Urban District Council recently accepted a tender £73 in advance of the lowest, which amounted to £867, ostensibly because the accepted tender was from a local contractor. The specification contained a clause to the effect that local men were to be used wherever possible and in preference to imported labour, so that the interests of the local workmen were secured in any event. In this case it is difficult to see what justification there was for the action taken, as, if it was intended to place the contract locally, the competition should have been limited accordingly. In regard both to appointments and contracts we have always urged that applications should not be invited unless they are to receive *bonâ-fide* consideration.

* * *

Camp Sanitation.

In another column will be found the first of a series of articles on "Camp Sanitation" from the pen of Mr G. Bertram Hartfree, the engineer and surveyor to the Alton Urban District Council, which we especially commend to the attention of those of our readers who may at any time be called upon to make provision of this nature for troops. In discharging such a task two considerations must be borne in mind. In the first place the interests of the users of the temporary conveniences and of the camp inhabitants must receive attention, and in the second place it must be seen that nothing is done which will be prejudicial to the public health of the neighbourhood. The latter danger arises specially in areas where there are users of underground water, which may become contaminated through percolation of foul matter mixed with rain. Every case must be governed by the local geological and other conditions, and it is evident that great service can be rendered by municipal engineers placing their local knowledge at the disposal of the military authorities. When large bodies of troops are billeted in public buildings, too, special sanitary arrangements are necessary, and in this connection interest attaches to Mr. Hartfree's statement that he is indebted to a detained alien enemy for the design of some ingenious emergency urinals, probably familiar to ship's plumbers. Too much attention cannot be given to these and similar matters, as upon them in large measure depends the health of the soldiers.

*

A Novel Exhibition.

It is some seventeen years since any substantial improvements were made in the equipment of the department of street cleaning of the city of New York, and now that the adoption of improved methods and appliances is to be undertaken, it is proposed to hold an exhibition with the threefold object of educating the inhabitants, giving manufacturers an opportunity of showing their wares, and providing facilities for practical tests and demonstrations. Among the matters which will be included in the exhibition are not only all kinds of brooms, brushes, sweeping machines, flushing machines, and other equipment used in street cleaning, but also household receptacles, transport vehicles and destructors. The idea is a novel and interesting one, and it is to be hoped that it may meet with a large measure of success. There can be little doubt that manufacturers will be quick to take advantage of the occasion to show their goods to the officials of the New York department, and at the same time to those of many neighbouring authorities, and if the general public can be induced to display any interest in the undertaking and be brought to some appreciation of the importance to the community of the work of a cleansing department, the exhibition will indeed not have been held in vain.

Camp Sanitation.

(1.)—LATRINES AND CLOSETS.

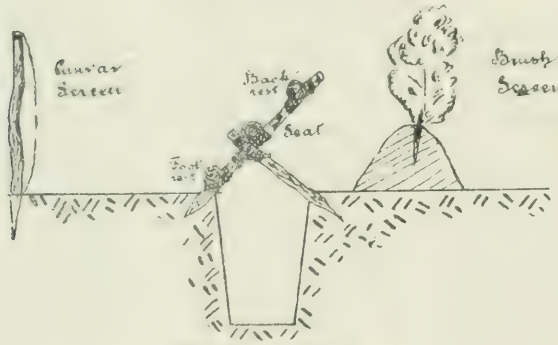
By C. LERTRAM HARTLEY, A.M.I.C.E., Engineer and Surveyor to the Alton Hants, Urban District Council.

[illegible] detected, as with soil misuse, needs more careful supervision than the latter. In addition, there is far more risk of pollution of underground water supplies from liquid than from solid filth.

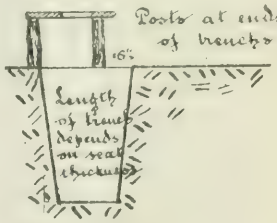
While it is generally accepted that a trench is all-sufficient for temporary camps, there appears, in some areas at least, that, although there may be no danger [illegible] of the underground water may be a matter for serious consideration. Every case must be governed by local and geological factors, and consequently the advice [illegible] tage.

Several manuals advise that latrines should be about 100 yds. from the camps. While, however, this arrangement minimises nuisance at the camp from the latrine, it increases the possibility of the latter not being used, leading to consequent fouling of the ground around the tents. Unless very near, it may [illegible] as certain that the latrines would not be [illegible] The height of the seat pole should be 18 in. off the ground, with its centre not exceeding 1 ft. from the inside edge of the trench, 3 ft. in width. The best position for the back-rest is 18 in. above the seat, and a pole at or near the ground line is desirable. The latter is usually described as the foot-rest, and if not required for that purpose, is an advantage, in some measure at least, in performing one of the duties of the risers supplied to ancient privies. Should portable seats be provided in lengths, but otherwise of orthodox shape, it is advisable that their front edges should set back a distance of 6 in. beyond the front of the trench, thus reducing the possibility of the ground surface becoming urine sodden.

The usual practice is to cover the contents of trench latrines with dry earth at least once daily. When necessary, fill in with the excavated earth, and dig new trenches. At a camp that I am supervising I was compelled, owing to the nature of the subsoil, to adopt a different system. The top earth is clay and loam, but below the upper chalk exists. In consequence, trenches were dug in the top earth, and the contents covered with quicklime daily. The fæcal matter, which was received in iron troughs, was removed to a site 200 yds. from the camp. Here it was



PLAN SEAT LATRINE



ORDINARY SEAT

visited at night, with results which can readily be imagined. It is desirable that day latrines should be the greatest distance away—within reason, of course—and that for night use a sufficiency of suitable receptacles should be available. There is an objection to the ordinary water pail or bucket, which, unless legibly branded to ensure its being kept solely for this use, may serve a dual purpose. Safer utensils are the small-pattern galvanised bins commonly provided for house refuse, or the galvanised pails of similar type to those used in earth-closets. Should the foregoing not be obtainable, any non-absorbent article will suffice; but, if possible, materials that can easily be removed should be provided, and every care taken to reduce to zero the possibility of spilling or splashing.

For day latrines a shallow trench is suggested for rest camps. For longer periods than twenty-four hours, a depth of from 3 ft. to 6 ft. is advised, and the width should average 2 ft. 6 in.

A point for controversy is whether the width should be greater at top or bottom, it being claimed in favour of the latter that by undercutting the sides are protected from fouling. The advantage is doubtful; in addition there is the risk of unsupported earth giving way, and sacrificing the man to save the earth sides. The safer course is to allow a width of 3 ft. at top and 2 ft. at bottom.

When setting out an ordinary latrine, it is usual to allow 1 lin. ft. for seven men. Scaffold poles are the usual substitutes for seats, but to the uninitiated this system leaves much to be desired. However, practice leads to perfection. A great improvement deposited on a thick layer of lime, and spread in alternate layers of soil to earth or ashes. An improved system of receptacle has now been adopted, owing to the continuation of the camp, but the disposal is unchanged and quite satisfactory. When sufficiently decomposed, the contents of the heap will be used as a surface manure.

A difficulty met in billeting is the sanitation for large halls, the closets for which are insufficient for large numbers of residents. Some twelve months back I fitted up a drill hall for the use of a double company by providing Moules' earth-closets and a plentiful supply of dry ashes. If obtainable, dried earth, peat, moss litter, and other similar material is, naturally, better than ashes. Authorities advise that sun-drying is preferable to artificial heat, as the latter kills the micro-organisms that assist in the work of excreta disposal. For urine, the various receptacles mentioned for night use in open camps would be suitable. I am indebted to a detained "alien enemy" for the design of some ingenious emergency urinals, probably familiar to ships' plumbers. The general idea follows the stoneware basin-shaped urinals, with a high back and sides, rounded fronts, dished base, and an outlet at bottom, the whole being neatly constructed of zinc, with clean-soldered joints. I approved their use as an experiment, subject to their being fixed in a position that allowed easy and frequent removal for cleansing, and the waste pipe being taken outdoors to discharge into a galvanised-iron pail.

All receptacles used for camp sanitation should be frequently emptied, and limewashed before being re-

barrel for use. Wherever possible liquids should be poured down a gully leading to a public sewer.

When camps are intended for long occupation more permanent offices are required. Floors of concrete, laid to suitable falls, are necessary; the roofs may be covered by galvanised iron. Timbered sides covered with iron have the objection that innumerable crevices are formed, but Brother John of the Order of St. Paul (whose abbey at Alton is now used as a concentration camp for alien enemy seamen) has solved this difficulty by erecting a timber framing and fixing the galvanised iron inside. The sides of the doors are cutter if the, are 6 in. short at top and bottom to allow of effective ventilation. Internal partitions are not required, and a screen at the entrance is preferable to a door. Urinals for temporary camps required for long periods may be constructed with concrete floors and galvanised-iron sides and backs, the timbers being on the outside of the iron. Liquids should gather to a main channel leading to a trapped gulley, the drain of which discharges on to a suitable disposal site. The constant use of quicklime or chloride of lime in camp sanitary offices is necessary.

WORCESTERSHIRE ROADS.

COUNTY SURVEYOR'S REPORT.

In his report for the year 1913-14, Mr. C. F. Gettings, county surveyor of Worcestershire, gives expression to a feeling of relief that in the near future some considerable assistance from the Exchequer Funds may be looked for, as undoubtedly the limit has been reached as regards the county contribution towards the cost of maintenance of trunk roads, which have now become more or less a national liability.

Surface tar-painting was extended in the county during the year, some 60 miles being treated at a cost of £3,153. Dehydrated tar was used, and all work was carried out by the county staff. It was an excellent season for this class of work, and the results obtained thoroughly justified the expenditure. The committee appreciated this fact, as there was no hesitation in agreeing to increase the estimate for similar work for the current year to £4,800. "Apart from the question of comfort to residents and users, there is no doubt," remarks Mr. Gettings, "that the life of all roads that take fast light motor traffic has been considerably extended."

Owing to the delays experienced last year in obtaining plentiful supplies of grit, a quantity of this material was purchased during last winter for the current year. Some difficulties have been experienced in obtaining supplies of materials—especially tar-macadam—but Mr. Gettings believes the merchants have done their best, having regard to the increased demand for this material.

Considerable trouble has been experienced in obtaining manual labour, and for certain classes of work it has frequently been necessary to import men in order to get the work carried out expeditiously.

The report mentions that a new bridge was built at Defford, and Upton Snodsbury Bridge was widened and strengthened, in addition to which considerable repairs were carried out to various other bridges in the county.

URBAN MAIN ROADS.

Frequent inspections have been made of the whole of the main roads in the municipal boroughs and urban districts. In several cases the roads have got into a weak condition in consequence of the increasing heavy traffic. The county surveyor does not consider it economical to continue to repair many of these roads with ordinary water-bound macadam, and some approved bituminous surface should, in his opinion, be substituted. In the majority of the districts, where the surface of the road is not tar-macadam, it has been tar-painted, and in several of these cases Mr. Gettings considers that street watering is done to an excessive extent and to the detriment of the tar surface.

The increasing expenditure in urban districts has previously been referred to by the county surveyor, and he is afraid that further increases must be anticipated until the whole of the urban authorities have brought their roads up to a standard that is necessary for the present-day traffic.

ROAD BOARD SCHEME.

The scheme for strengthening, widening and surfacing with bituminous-bound material about 53½ miles of main roads, at an estimated expenditure of £127,000, was commenced in May, 1913, following approval by the Road Board.

Good progress was made during the summer of that year, and in consequence of the favourable winter the work was not held up to any extent, so that it was found possible to complete the proportion of work provided for. During the current year a similar rate of progress has been maintained, and at the present time some 14 miles of roads have been completed.

"To anyone who is not acquainted with the conditions under which we are working, the rate of progress may, perhaps," Mr. Gettings observes, "appear to be slow; but when it is considered that we are not only having to widen the roads in the majority of cases, but strengthen every road the full width, it will be seen that a large tonnage of materials is required. It may be interesting to know that for every mile of road reconstructed about 2,400 tons of foundation materials and 1,550 tons of surface materials are used. The committee are aware that I hold very strong views as to the necessity for having a first-class foundation before applying an improved surface, as, although I appreciate it is expensive in the initial outlay, the results will lead to economy."

In connection with the scheme referred to, the committee decided to lay a few trial sections constructed with various surface materials on the Worcester and Droitwich road. It is just over a year since these were completed.

TRIAL SECTIONS.

The site chosen is on the Worcester and Droitwich main road at Perdiswell, and the first length commences at the Worcester city boundary. The road is very nearly level and straight, has an open situation and is well drained, but is not kerbed on either side.

From the census returns taken in July, the average daily traffic amounted to about 825 tons per day, which is an increase of 176 tons per day compared with returns taken twelve months ago.

There are seven sections, each about 150 yds. in length, the total length being 1,096 yds. The road is about 20 ft. wide, and the superficial area is 7,446 sq. yds.

Previous to reconstruction the road averaged 18 ft. in width, and the surface consisted of a very thin coat of Clee Hill granite laid on a subcrust of gravel. The old road was left undisturbed, and the sides widened out to give the present width of 20 ft. A trench about 2 ft. wide and 9 in. deep was excavated along each side of the road, and filled in with 6-in. broken slag. These sides were rolled, and then the foundation coat of 3-in. to 4-in. slag was laid throughout, and consolidated to a thickness of 5 in. by a 12-ton roller. The various kinds of surfacing materials were laid to a depth of from 3 in. to 3½ in. when consolidated, and rolled by an 8-ton roller, except in the pitch-grouted section, on which a 12-ton roller was employed. Both the foundation and the surface coats were laid half the width of the roadway at a time, but only in short lengths, and the traffic was kept going without interruption during the progress of the work. The whole of the work was carried out by the county council's own staff, and all the various kinds of tar-macadam were laid by the same gang of men to ensure uniformity of work. All the sections were tar-painted during June, 1914, and in nearly all cases the tar-painting had a beneficial effect, particularly in sealing the surface layer, and in preventing this from breaking up.

A Surveyor Recovers Damages for Assault.—The surveyor to the Swansea Rural District Council, Mr. Gabriel T. Powell, was awarded £5 damages on Monday in an action in the Swansea County Court against a firm of ironmongers at Pontardulais. In the discharge of his duty Mr. Powell was engaged in dealing with a plot of land about which there had been dispute when defendants squirted black varnish on his face, his eyes being affected for a fortnight and his clothes damaged.

Newcastle's "Troglodyte Habitations."—In his annual report the medical officer of health of Newcastle-upon-Tyne, Dr. Harold Kerr, expresses a hope that very soon the city will be entirely freed from the troglodyte habitations on the quayside. It is certain, he says, that houses at present self-contained, with basement kitchens, will have to be strictly watched against their being let off as tenements with inhabited cellars. Unfortunately, the law gives no power to interdict their use at present, although servant girls may be compelled to pass the greater part of their daily lives below ground.

E.

The Functions of a Municipal Engineer.

By Prof. E. R. MATTHEWS, [illegible], Chadwick Professor of Municipal Engineering in the University of London.

[Prof. Matthews has now taken up his new duties at University College, where on Monday last before a gathering presided over by Sir William J. Collins and including the Provost of the University, Dr. Gregory Foster, he delivered the first of a series of three public lectures. The Dean of the University, Prof. E. G. Coker, D.Sc., M.INST.C.E., in introducing Prof. Matthews, remarked that the latter, for sixteen years borough engineer of Bridlington, had already won his spurs in the municipal engineering world. Prof. Matthews' second lecture, which will deal with the subject of Refuse Disposal, will be given on Monday next at 5.30, and his third lecture, on Reinforced Concrete in Municipal Engineering Works, on the following Monday, at the same time. Admission on both occasions is free.]

[illegible] that connected with municipal work, and the position of engineer to a corporation is becoming more responsible every year. There are in England and Wales 25,000 local authorities, and most of these have already spent vast sums of money on public works under existing Public Health and other Acts. The Local Government Board for some years past have sanctioned borrowing to the extent of about £14,000,000 annually. In addition to this there are the loans which are obtained by means of Acts of Parliament.

The present amount of outstanding loans for which local authorities are responsible is about £500,000,000, and most of this is for municipal engineering works. It will therefore be obvious that the appointment of an engineer to a local authority is no small matter, for it will devolve upon him in most cases to spend, wisely or unwisely, large sums of the ratepayers' money, and the need that he should be a well-trained engineer must be very apparent.

SECURITY OF TENURE.

Not only so, but I believe the time is fast approaching when the municipal engineer will be an official who will reap the advantages of a pension, and who will be given "security of tenure" by the Government. On the other hand, the time has arrived when no one should be allowed to hold an appointment as municipal engineer to a corporation (who has not hitherto done so) unless he can show that he has had a theoretical training as well as practical experience. It is the purpose of the Engineering Department of this University to give such training. In addition, we are hoping to train many students for municipal appointments (engineering assistants) in the Colonies, in India, Japan, China, and other countries.

INCREASING DUTIES.

New legislation is imposing fresh duties upon a municipal corporation, so that the duties of their engineer are increasing rapidly, and his position is therefore growing in responsibility. Every town of any importance has its own waterworks, sewage works, and tramways, while many corporations own the gas and electricity undertakings, the public baths, and in some cases the golf course, and even places of entertainment.

PROTECTION OF COAST TOWNS.

In coast towns the protection of the town against the inroads of the sea is a matter which has to be dealt with by many corporations, and very often costly protection works have to be put down. At Bridlington, for example, over £70,000 has been spent by the town in protecting and improving about 1 mile of the north foreshore, and the repayment of the principal and interest represents a 9d. rate, while at Filey, 12 miles further north, the coast protection works have involved the town in a 1s. 3d. rate. The Hastings Corporation have spent huge sums of money in protecting their town, while at Brighton an average of £2,500 has been spent annually for a number of years in sea defence works. Scarborough has also carried out a good deal of protection work, costing many thousands of pounds. Not only have large sums of money to be spent in protecting coast towns against the inroads by the sea, but huge sums have to be spent in the carrying out of sea front improvement works. I have been called upon, for example, to design and carry out at Bridlington sea front improvement works costing £40,000, and it has been my duty quite recently to design further improvement works which are to cost £50,000, and which will be proceeded with when the war is over.

Coast authorities have, however, this advantage, that (generally speaking) they are saved the cost of constructing expensive sewage disposal works, as the sewage is discharged, after passing through screen chambers, direct into the sea, either at high water and the commencement of ebb, or at all states of the tide.

In the engineering course at this University the actual designing of sea walls and other forms of sea defences will be ably dealt with by my experienced colleague Mr. A. T. Walmisley, M.INST.C.E., of the Dover Harbour Works.

CHIEF DUTIES OF A MUNICIPALITY.

Whether coast or inland town, the chief duties of a [illegible] are —

(1) To supply pure water for the use of its inhabitants.

(2) To provide a proper sewerage system with sewage disposal works.

(3) To construct suitable streets and highways, and to maintain these.

(4) In many towns to put down and maintain a tramway system.

(5) To adopt a proper method of collecting and disposing of house refuse.

(6) To establish a satisfactory system of street lighting.

The borough engineer of a town has many other duties to perform besides those coming under these six headings, such, for instance, as the making up, so that the corporation may take over, of private streets, tree planting in streets, the construction of highway depots and municipal workshops, the building of stables and public conveniences, the designing and erecting of sanatoria, the laying out of corporation estates and of cemeteries, and the carrying out of cemetery extensions, the designing and erecting of council schools, the supervising of the street cleansing department, the erection of fire stations, markets, public slaughter-houses, public wash-houses, swimming and other baths, the designing and erecting of electricity works and waterworks pumping stations, the demolition of insanitary areas, the erection of workmen's houses, the laying out of parks, gardens, and recreation grounds, the erection of public shelters, the preparing of schemes for the widening of existing narrow streets, the reporting on building plans sent in as to whether these are in accordance with the by-laws, the control of indoor and outdoor staffs, the latter usually including inspectors, foremen, and workmen—these are some of his many duties.

As to the preparation of plans, it is his duty to prepare for the corporation plans, specifications, estimates, and quantities for most, if not all, of the engineering works which the corporation may require from time to time, also Parliamentary plans with book of reference, and to supervise the carrying out of these works; he will also frequently be required to write reports, and it will be his duty to give evidence at all Local Government Board and other inquiries.

In addition to these and many other duties which he has to perform, the municipal engineer has now to prepare for his corporation town planning schemes, and in preparing these he must be able to look ahead, chiefly from an engineering point of view, and to anticipate the requirements of the town, say, twenty to thirty years hence. He will therefore have to be a man who dreams dreams and sees visions. But, in preparing a town planning scheme, I certainly think that he should work in conjunction with an architect, for, after all, town planning is more of an architectural matter than an engineering. The Institution of Municipal and County Engineers have recently decided to grant a certificate or diploma in "Town

Planning," which is to be obtained by examination. This is a step in the right direction, as is the establishment of a town planning department in connection with the Architectural Department of this University. I hope that municipal engineers who are appointing assistants will give preference to those who hold certificates in this subject.

The introduction of reinforced concrete in engineering constructions makes it very necessary that he shall be acquainted with this material, and understand how to calculate the strength of it under various conditions, and this information, which has been so ably imparted in the "Civil and Mechanical Engineering Department" by my friend Prof. Cormack, will now be dealt with by Prof. E. G. Coker, D.SC., M.INST.C.E. I intend in my third public lecture to deal with the use of reinforced concrete in municipal engineering works, and to refer to its use in reservoir construction later in the present lecture.

It is also extremely necessary that the municipal engineer should have a thorough knowledge of building construction, for while he must not claim to be an architect—for that is not his profession, and my experience has been that the man who is a good architect is a poor engineer—nevertheless, he will usually be responsible (out of London) for the inspection of new buildings. He will often have to advise his council as to whether or not a rolled steel joist of a certain section will be sufficiently strong to carry a wall that is to rest upon it, or upon some other equally important point, and it will frequently happen that he will have to settle a dispute between an architect and a contractor relative to the strength of some part of a structure, and so "Building Construction" has been included as one of the optional subjects in the Engineering Department of the University. I strongly advise all municipal engineering students to take this. Every civil engineer should be an expert in surveying and levelling, and in the engineering course of this University this subject is dealt with in an able manner by my colleague Mr. Ormsby. I know of no one better qualified to deal with the subject.

CHIEF DUTIES OF MUNICIPAL ENGINEERS.

It will be quite impossible for us to-night to deal with the manifold phases of a municipal engineer's work, which I have named. We will therefore confine our attention to the six chief duties of a municipality as already set out, and discuss two or three matters which come under one or other of these heads.

These subjects will be fully dealt with in the Municipal Engineering Course in this University, when I hope to illustrate by means of diagrams the various methods of construction adopted both in this and other countries. I propose to make the course as practical as possible, and at the same time to give the students a thorough grounding in the principles involved, so that they will turn out in every way capable assistants to a municipal engineer. I intend to deal with the latest methods of sewage disposal, the construction of sewers in bad ground and under exceptionally difficult conditions, and generally to be as up to date as possible in methods of construction. There is a great need at the present time for well-trained road engineers and surveyors; the course will therefore include a number of lectures on this important subject, which should be of great value to those who are intending to enter that branch of the profession, whether at home or abroad. I am also dealing with "Town Planning from an Engineering Aspect." The rebuilding of the cities in Belgium and the North of France which have been so ruthlessly destroyed by the Germans will soon take place, and the cost of doing so will be debited to the account of the intruder. What that bill will amount to I dare not think, and while we can never replace the old, with which some of us are so familiar, nevertheless there will rise up from the ruins of the old cities, new ones, laid out on modern lines, with wider avenues and more perfect sanitary conditions, and the municipal engineer will be the man whose services will be required in this connection. His knowledge of town planning and sanitation will be of immense value to those who will seek his services.

I now propose to draw your attention to one or two matters which, at the present time, should occupy the special attention of the municipal engineer. The first of these is the use of

MOTOR VEHICLES IN MUNICIPAL WORK.

It is the duty of every borough engineer to carefully consider where he can save by the use of motor instead of horse-drawn vehicles. In some towns such vehicles are in use for street-watering purposes; in other towns they are used for street sweeping, and in some they are employed in the collection of the town's refuse. For all of these purposes, with the exception of the latter, they are admirable, and I believe a saving can be effected. I do not, however, consider that they are suitable for the collection of house refuse. Then the engineer must choose between petrol, electric, and steam driven vehicles. The choice will depend entirely, of course, on the work the vehicle has to do. It may be that it is required to do a variety of work, or it may be needed to perform the same task daily, or speed may be the chief consideration — to keep work going at wide distances.

Mr. Hugh Miller, in an interesting series of articles on this subject which recently appeared in the *Sanitary Record*, has set out in tabular form the cost of running a motor vehicle, and assuming the vehicle to be capable of doing 125,000 miles, and of carrying a load of 2 tons, and that it cost £475, the cost of tyres being £85, then in the following table is set out the cost of running and upkeep.

—	Miles per Day.	
	40	60
	s. d.	s. d.
Interest on capital, 5 per cent	1 7	1 7
Depreciation	3 0	4 6
Insurance	1 0	1 0
Rent	0 6	0 6
Tyres ...	6 8	10 0
Driver's wages	4 0	6 0
Oil	0 8	0 11
Petrol (10 miles per gallon at 1s. 6d.) ...	6 0	9 0
Repairs	2 0	2 6
Total cost per day	27 5	36 0

If a 4-ton motor van be used instead of a 2-ton, the cost of running would be as follows:—

4-TON MOTOR VAN, £650. COST OF TYRES, £125

—	Miles per day.	
	40	60
	s. d.	s. d.
Interest on capital, 5 per cent	2 2	2 2
Depreciation	4 2	6 3
Insurance	1 0	1 0
Rent, &c.	0 6	0 6
Tyres	10 0	15 0
Driver's wages	6 0	6 0
Oil	0 8	1 0
Petrol (6½ miles per gallon at 1s. 6d.) ... ... (This is not the war price probably.)	9 2	13 9
Repairs	3 0	4 6
Total cost per day	36 8	50 2

It would appear from these figures that a saving can be effected by the use of the motor vehicle.

Among the electric motor vehicles suitable for municipal work might be mentioned the "Fram" vehicle, as used by the municipality of Paris, Havre, and Nancy. The outstanding feature of this vehicle is its simplicity, and the fact that the whole of the driving mechanism is contained on the forecarriage, which is thus a self-contained driving unit.

On the Continent "Fram" wagons have been brought to a very high state of mechanical and electrical efficiency, and there are to-day in use in Paris working for the municipality over 100 5-ton wagons. These are in use for dust collecting and other municipal purposes. The Paris "Frams" are fitted with special metal tank bodies, which are carried low down so that the loading line is only 4 ft. 7 in. from the ground level. This low loading line is only possible owing to the fact that there is no driving mechanism whatever on the chassis.

There are many advantages attached to the front drive, and for work calling for the wagon to run alongside the kerb; the front drive enables the vehicle to draw out even on a slippery, steeply cambered surface without slipping or skidding, which very often takes place with rear-driven wagons.

The "Fram" wagons appear to be easy to drive, and the simplicity of the driving mechanism ensures that the cost of maintenance is reduced to a minimum.

The chief cost is the upkeep of the battery, but as regards this the makers should be prepared to enter into a maintenance contract; the cost to be incurred in this respect would therefore be ascertained. For short-distance heavy carting work, entailing many stops, a wagon of this type is very suitable, and will probably be found to be less expensive than petrol and steam wagons engaged upon this class of work. Of course, any type of body—such as a plain platform, a lorry body with falling detachable sides, or a dust-wagon body—can equally well be supplied and fitted to motor vehicles, or bodies can be made to tip either by mechanism operated by hand or by electric motor if desired.

(To be concluded.)

Welsh Housing Conditions.—The council of the Welsh Housing Association, at their meeting recently, adopted the following resolution on the motion of the president, Lady Boston: "That the council of the Welsh Housing Association is of opinion that the conditions of housing of the working population throughout the urban and rural districts of Wales and Monmouthshire are of so deplorable a nature, and the necessity for reform on a large scale is of such imperative importance, that the appointment of a central Welsh housing authority appears to be the only action likely to prove effective for solving the problems involved."

Road Surfacing in the East.—It is pleasing to note, says the *Ceylon Observer*, how Colombo roads are being systematically oiled, and dust nuisances appreciably allayed week by week. Similarly Hongkong has been experimenting with various methods of tarmac for road surfacing. The Russian Municipal Council in Hankow are busy laying a long stretch of tar-macadam road. They have also tried to sprinkle the roads with absorbitant soda which, absorbing the moisture from the air, keeps the road damp and dustless. The British Municipal Council are engaged in covering a part of one road with crude petroleum, a method adopted with a good deal of success in Singapore as in Colombo.

Manchester Architecture.—Mr. F. B. Dunkerley, in his presidential address recently to the members of the Manchester Architectural Society, expressed regret that the City Council and the Royal Exchange authorities did not come to an arrangement to carry out the larger and bolder scheme which was put forward for the extension of the Exchange. As regarded the site of the old infirmary—"still unoccupied save by a few jerry sheds and a great many weeds," "serving no better purpose than a rubbish heap"—he submitted that the council, if unwilling to provide for an art gallery and a library on the site, should build a library there and extend the present Art Gallery.

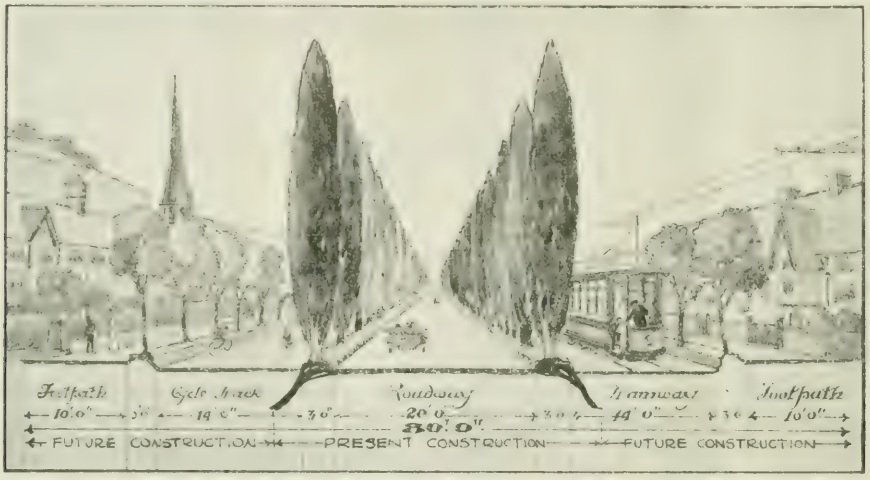
A NORTH WALES COAST ROAD.

FLINTSHIRE COUNTY SURVEYOR'S SCHEME.

In a report presented at the last meeting of the county council, Mr. Saml. Evans, M.S.I., the county surveyor of Flintshire, outlines his scheme for the laying out of a road giving direct means of communication between Gronant and Rhyl, by way of Prestatyn. At present, in order to travel from Gronant to Rhyl, it is necessary to pass over a highway which, winding as it does through the hills, is in places both tortuous and dangerous. The proposed new route takes an entirely different line, hugging the coast and being almost straight for the whole of its length. Good alignment and gradient, accommodating width and business-like directness have all been aimed at by the author of the scheme; at the same time the æsthetic side of the question has been kept in mind.

The county surveyor mentions 80 ft. as the width of land required for the road, but at present it is proposed only to run a 20-ft. carriageway through from end to end.

"I want the road to be a creditable road when the first part—viz., the 20-ft. road—is completed," observes Mr. Evans in his report. "After that an endeavour would undoubtedly be made to plant trees alongside the highway, and what would grow quicker and have a more stately, dignified appearance than a straight 3-mile stretch of poplars, 50 ft. apart and 60 ft. high? On each side, as requirements make it necessary, a portion of the width would be set apart for a tramway or route for motor 'buses. Another width could be set apart for a cycle or riding track with green margins between each and spacious paved footways on each side for pedestrians."



Gronant Rhyl Road. Proposed Cross Section.

Calcutta Roads.—The Secretary to the European Association has submitted a memorandum to the Bengal Government on the roads of Calcutta. In the course of it, he says: "My council believe they are correct in saying that the great majority of the 277 miles of roads in Municipal Calcutta have not been constructed on approved engineering methods of construction, but simply represent accretions of surfacing material, laid upon the very uncertain base provided by the deltaic silt characteristic of the locality. The road crust thus formed is inevitably of varying thickness, unequally supported, and consequently not such as can be expected to remain in proper condition when subjected to heavy loads moving at the legal limit of 12 miles an hour, or more. It appears to my council that in these circumstances it will probably be necessary to adopt a considerable programme of road reconstruction in the areas in which heavy motor traffic is permitted."

SOME WATERWORKS ENGINEERING MISTAKES.*

By D. H. Maury.

In 1895 it became necessary for the Peoria Water Works Company, of which the writer was then engineer and superintendent, to increase its water supply, and to do so rapidly. This plant included, among other items, an open well 11 ft. in diameter. In the construction of this well the earth was first excavated as far as the gravel water would permit, and a cast-iron well shoe, built of circular segments was bolted together, and on top of this well shoe were bolted segments of cast iron designed to widen the shoe and to serve as a "batter" for the brick masonry wall of the well. Excavation was started inside of the well shoe, the masonry wall being built up on top of these segments as the well sunk. It was the intention to sink this well to bed rock, seal the bottom well, concrete so as to make a watertight pit, and then drive air pipes through apertures in the wall.

The writer, however, made the mistake of pumping from the inside of this well, part of the material being removed by the pumps and part by buckets, which were filled by men standing on the bottom. The well sank rapidly, from 2 ft. to 3 ft. a day, until within 12 ft. of bed rock, when its progress was suddenly diminished, and all efforts failed to get more than 4 ft. further. It was found that at about 8 ft. from bed rock the sand ran in under the shoe as fast as it could be removed.

An effort was then made to sink a steel ring, 10 ft. in diameter by 5 ft. in depth by ½ in. thick, on the inside of the well in the hope that this could be sent down to bed rock; but after much time had been lost in trying to keep ahead of the incoming sand, the attempt was abandoned. Oak wedges were then driven so as to close solidly the space between the ring and the wall of the well, and four 6-in. driven wells were sunk to bed rock. Four 6-in. push wells were also driven out through holes in the wall of the well, and all eight of these 6-in. wells were connected up to the centrifugal pumps, and the plant was finally put in operation. It has been operated successfully, when-ever required, during the past nineteen years.

RUNNING SAND.

The reason why it was impossible to sink this well any further was that, as the well approached the bed rock, the area of the belt of water-bearing sand through which the water had to pass in order to reach the pump was constantly growing less. At the same time the rate of pumping was constantly increasing. Consequently, when the point was reached at which the velocity of the inrushing water became so great that it dragged in the sand, this sand simply continued to run in as fast as it was removed, and the well naturally could sink no further.

On looking back at the work, this explanation of the trouble seems so simple and natural that the writer has wondered many times why he did not foresee the difficulty; but he has since seen the same mistake made so often by others that he feels encouraged to hope that this description of his own experience may prevent someone else from going wrong in the same direction. In his own practice the lesson has been of much service, for it has led to the construction of a number of wells, in the design of which special attention was paid to the matter of preventing the inflow of sand, not only during the process of sinking the well, but also after the well has been finished and put in operation.

The particular well first described could have been sunk to bed rock at much less cost, either by the pneumatic process or by excavating from the inside with orange-peel bucket without pumping, or by sinking other wells outside of the large well and pumping from these to lower the water in the large well. As the sand was removed the well would have sunk, provided the weight of the well were sufficient to overcome the skin friction. No more sand would have run into the well because of the fact that the water would have had no velocity to cause the sand to flow.

This mistake of the writer was at the time an expensive one for his client, but he has the satisfaction of knowing that the extra cost of this well was saved many times thereafter in other wells sunk in better fashion for the same client.

TILE v. IRON PIPES.

The writer made another mistake in connection with this same piece of work. The water furnished by the supplemental well was brought down by gravity to the main, well some 3,300 ft. away. For conveying this water a 24-in. vitrified tile pipe was built. It was hoped that this tile pipe would cost much less than a cast-iron pipe, and it was believed that the tile pipe could be made practically watertight.

The attempt to make the pipe practically tight was successful, but the expense was so great that the writer can now see that he should have made this pipe of cast iron instead of tile, for much of the pipe had to be laid in quicksand, and where a great deal of ground water had to be taken care of, making it very difficult and expensive to make full cement joints in the tile, and to hold the pipe and the joint in place until the cement had set. Under these conditions cast-iron pipe would have actually cost less, laid in place, than the tile pipe.

Tile pipe has since been so often used for watertight work instead of cast iron, and so often with disappointing results, that it is hoped that a recital of the foregoing mistake may prove of service to others.

A third mistake entered into the design of a small waterworks, built about twenty years ago, and the writer's first complete waterworks installation.

This plant included an elevated tower and steel tank of about 60,000 gallons capacity, and for every part of that structure detailed working drawings were prepared. With the desire for originality—too often displayed by young men, inventors and others, lacking the wisdom of practical experience—considerable pains were taken to design connections which were novel. It is safe to say that the like of some of these connections has never been seen in any other structure, before or since.

The working out of all of these details not only multiplied the time required for the design of the structure by three or four, but the novelty of the connections also added several hundred dollars to the contract price, for the bidders could not use their standard shop connections, but were compelled to figure on the writer's more expensive and less practical designs.

The lesson to be learned from this last mistake is that no engineer, if he has his client's interests at heart, can afford to overlook the contractor's view point when he prepares his specifications.

Contractors must be expert in the practical details of construction, and especially in cheapening construction costs, or they cannot continue in business. If the young engineer wishes to learn more about these matters than he has ever learned before in the same length of time, let him, after he has prepared a rough draft of his plans and specifications, discuss these with a few of the more trustworthy and experienced contractors who are likely to bid on the work, and he will be astonished to find how many changes he can make to his client's advantage without in any way impairing the design of the work or the validity of the contract.

If the young man will then not let his exalted ideas of his dignity as an engineer prevent him from accepting suggestions of the contractors, he will show that he is worthy to receive much of the success which is almost sure to crown his future efforts.

From *Engineering and Contracting.*

Reduced Street Lighting in Surrey Towns.—The system of arc lighting has been discarded by the Kingston (Surrey) Town Council, and in most cases only one of the group of five incandescent lamps is being lit on each of the tall standards in the chief thoroughfares. If necessary the tops of the reflectors will be darkened. Steps have been taken by the Surbiton Urban District Council to darken the tops of some of the street lamps, so as to prevent them throwing any light upwards.

Pumps on Motor Fire Tenders.—A petrol motor tender belonging to the Bath Fire Brigade has just had its sphere of usefulness extended, a "Hatfield" pump having been fitted to the chassis by Messrs. Merryweather & Sons, who built the tender five years ago. The work has been carried out at Bath by one of the firm's mechanics, the new pump being geared to the existing propelling engine through silent chain transmission. The engine is a 50-horse power four cylinder, and the capacity of the pump is 350 to 400 gallons per minute. This is the first occasion on which Messrs. Merryweather have fitted a fire pump to an existing machine of their own make, but examples of "Hatfield" pumps fitted to other makers' chassis are in service at Huddersfield and Radcliffe.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

COUNCIL MEETING.

A meeting of the Council of the Institution of Municipal and County Engineers was held on Wednesday, the 21st inst., at the rooms of the Institution, 92 Victoria-street, Westminster, when there were present: Messrs. J. S. Brodie (in the chair), J. P. Barber, J. A. Brodie, J. S. Brodie, W. N. Blair, G. F. Carter, J. W. Cockrill, R. H. Dorman, W. Harpur, F. Harris, T. W. A. Hayward, W. T. Lancashire, E. B. Martin, F. Massie, L. S. McKenzie, P. H. Palmer, W. H. Prescott, N. Scorgie, H. E. Stilgoe, R. J. Thomas, H. T. Wakelam, C. F. Wike, O. E. Winter, the hon. secretary (Mr. T. Cole) and the secretary (Mr. J. W. Dudley Robinson). Apologies for absence were received from Messrs. H. P. Boulnois, C. Brownridge, A. D. Greenhow, E. P. Hedley and E. G. Mawley.

THE MEMBERSHIP ROLL.

The following applications were approved for election to membership:—

Members: Messrs. E. H. Collcut, engineering inspector to the Road Board; A. W. E. Fawkes, waterworks engineer, Calgary, Alberta, Canada; A. Hobson, engineer and surveyor to the rural district council, Grimsby; L. W. F. Howitz, chief draughtsman, Irrigation Department, Pretoria; A. W. Lloyd, county surveyor (Southern Division), Holland, Lincs, County Council; L. W. Pye, chief assistant surveyor to the urban district council, Cleethorpes; and H. L. Richardson, surveyor to the rural district council, Martley.

Associate-members: Messrs. S. F. T. Chandler, assistant engineer, Transkeian Territories General Council; T. J. Evans, county surveyor's department, Trowbridge; D. R. Nicholls, engineering assistant to borough engineer, Halifax; H. D. Sowerby, chief assistant, county road surveyor, Fife; and A. E. Wheatley, city engineer's department, Nottingham.

Students: Messrs. N. A. Alker, articled pupil to surveyor, Chorley Urban District Council; T. W. Bennett, articled pupil to surveyor, Easthampstead Rural District Council; G. W. Mann, borough surveyor's department, Ossett; R. A. Newstead, articled pupil to borough surveyor, King's Lynn; J. T. Robinson, 33 Coleshill-street, Atherstone; D. S. Samuel, assistant surveyor to Carmarthenshire County Council; A. J. Westaway, articled pupil to borough surveyor, Totnes; and A. F. Wyeth, articled pupil to surveyor, Epsom Urban District Council.

Transfers from Associate-member to Member: Messrs. A. W. D. Brown, engineer to the Shire Council of Swan Hill, Australia; H. Sanderson, chief assistant to borough engineer, Accrington; and W. B. Smith, engineering assistant to borough surveyor, Paddington, W.

Transfer from Student to Associate-member: Mr. G. Ponsford, deputy surveyor to the urban district council, Exmouth.

ACTING EXAMINERS.

The following acting examiners were reported to have been appointed for the examinations held on September 29th, 30th, and October 1st, 2nd and 3rd: Superintending examiner, J. S. Brodie; town planning, E. J. Elford; engineering, 1st paper, J. S. Brodie; engineering, 2nd paper, E. J. Silcock; building construction, E. Willis; sanitary science, H. Shaw; municipal law, S. G. Turner.

BRITISH STANDARD SPECIFICATION FOR BROKEN STONE AND CHIPPINGS.

A letter from the Engineering Standards Committee, dated August 20, 1914, was read, and it was decided to suggest certain amendments with regard to the maximum length of stone and dust to the specification.

NATIONAL INSURANCE ACT, 1911 (UNEMPLOYMENT).

Mr. R. J. Thomas reported that, as one of the four representatives appointed to attend the conference with the umpire on the unemployment insurance of roadmen, he had now received a draft copy of the award, of which he gave a *résumé*.

It was decided to recommend that the umpire be informed that the council did not approve the draft award.

THE N.A.L.G.O.

It was resolved to recommend that Mr. N. Scorgie be appointed as representative of the institution on the General Purposes Committee of the N.A.L.G.O.

SUPERANNUATION.

A letter was received from the secretary to the N.A.L.G.O. as follows:—

"I am directed to inform you that the President of the Local Government Board has now communicated with the Association of Municipal Corporations, the County Councils' Association, the Urban District Councils' Association, and the Rural District Councils' Association, in accordance with his promise to the deputation from this association which awaited upon him last month. Mr. Samuel has forwarded to each of the before-mentioned associations a copy of his reply to our representatives—a full text of which appears in the present month's issue of the *Municipal Officer*—and has invited their 'observations on the subject, and if they should be in favour of the proposal generally, any suggestions which they might desire to make would receive the president's careful consideration.' You will no doubt be fully aware that the representatives on the councils of the associations mentioned (which represent the whole of the authorities covered by our branches) consist of members of councils, in addition to town clerks, clerks to the councils, &c., and it is assumed, more particularly in connection with the Association of Municipal Corporations, that, when the communication from the President of the Local Government Board is under consideration, the voting thereon may be left to 'others than officials,' and I am therefore directed to ask your committee to take this matter into their immediate consideration with a view to enlisting the sympathies of your council's representatives—who are not officials—to ensure a favourable decision being given in favour of the proposed inquiry, when Mr. Samuel's letter is under consideration. The importance of taking this step without delay will be obvious to you, and I am to suggest that you should confer with your chief officer, or officers, as to the best way to achieve the object of this letter. If your association or guild covers a number of authorities, I am to request that you will endeavour to secure the sympathies of the representatives of each authority so covered."

It was decided to draw the attention of members to the matter, so that they might take individual action.

INSTITUTION MEETINGS.

It was resolved that May 8, 1915, be approved as a provisional date for the postponed meeting at Scarborough.

LETTERS OF CONGRATULATION.

It was resolved that letters of congratulation be sent to Mr. Thomas Adams, on his appointment as town planning adviser to the Canadian Commission of Conservation, and to Prof. Adshead, on his appointment as Professor of Town Planning at the University of London.

NATIONAL ROAD CONGRESS, 1915.

In view of the impossibility of many members attending the proposed congress, owing to the depletion of their staffs and other causes connected with the war, it was resolved "that, in the opinion of the council, the present state of public affairs renders it inexpedient to hold the proposed conference in 1915, that it should therefore be postponed to a more convenient date, and that in the circumstances they cannot undertake to co-operate with the County Councils' Association as suggested."

TESTAMUR EXAMINATION, OCTOBER, 1914.

The acting examiners' report was received, and it was resolved to award the testamur to Messrs. E. T. Annett, G. S. E. Barker, W. A. Burn, R. E. David, F. St. G. J. Fox, J. H. Gregson, R. Hudson, Gylbert Kershaw, G. W. Lawson, and G. Ponsford.

TOWN PLANNING CERTIFICATE EXAMINATION, SEPTEMBER, 1914.

The acting examiners' report was received, and it was resolved to award the Town Planning Certificate to Messrs. E. M. Bate, A. J. Price and W. H. Price.

NORTH-WESTERN DISTRICT: EXECUTIVE COMMITTEE.

The election of the Executive Committee has resulted as follows:—

Members: Messrs. J. A. Brodie, city engineer, Liverpool; E. L. Morgan, borough engineer, Bolton; S. S. Platt, borough engineer, Rochdale; A. J. Price, borough engineer, Lytham; J. A. Settle, borough engineer, Bury; E. Worrall, surveyor to urban district council, Stretford.

Associate-members: Messrs. W. Debney, borough engineer's office, Birkenhead; A. J. Price, borough engineer's office, Eccles.

BASINGSTOKE ELECTRICITY WORKS.

The idea of the introduction of electricity into the town of Basingstoke was first mooted in 1894, when a report and estimate of cost was presented by a well-known electrical expert. Financial reasons, however, doomed this to failure. In 1902 the idea was again pressed forward and further reports and plans were submitted by another electrical engineer. A scheme was approved and a Provisional Order obtained. Negotiations were carried forward for a considerable time with a company who were prepared to lease the Order from the corporation on what appeared to be favourable terms. The Board of Trade, however, refused to sanction the suggested proposals, and the scheme thereupon fell through. The corporation were then unwilling to work the undertaking themselves, and in the end the Provisional Order was revoked by the Board of Trade.

Basingstoke Electricity Works.
(View shows other block in front and engine and battery room in rear.)

In June, 1912, the subject again came up, consequent on a letter from the London and South-Western Railway Company asking if the corporation were likely to be in a position to give them a supply. The borough engineer, Mr. F. Reginald Phipps, Assoc. M.Inst.C.E., F.S.I., was thereupon instructed to bring up a report on the subject, and especially to advise as to whether the corporation should themselves undertake a supply, or allow a company (who had intimated their willingness) to do so.

A small deputation, with the borough engineer, visited various towns, and after carefully considering their report and the proposals of the company, the council decided to establish an undertaking themselves. The borough engineer was thereupon appointed to carry out the scheme, and to prepare the necessary plans and estimates. A Provisional Order was applied for in the autumn of 1912 and duly obtained, though the local gas company opposed, and intimated their willingness to supply electricity themselves. On receipt of the Royal Assent to the Order, application was at once made to the Local Government Board for a loan of £14,000 for the carrying out of the scheme. An inquiry was held on December 18, 1913, by Mr. T. C. Ekin, and sanction to the loan was granted on February 11, 1914. The work was immediately put in hand, and the opening ceremony took place on Thursday of last week, the 15th inst.

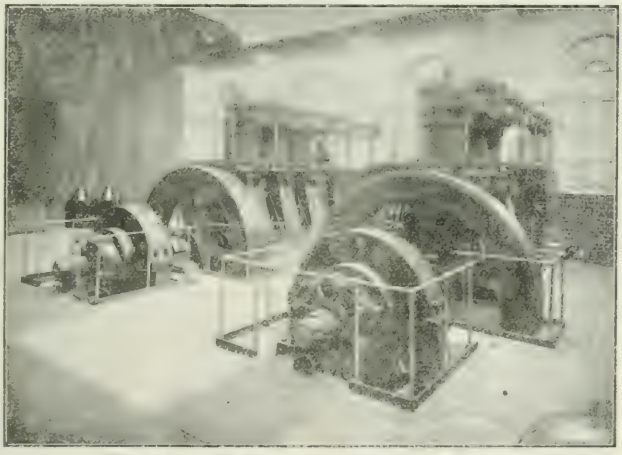
The loan as sanctioned was as follows: Land and expenses, £340 (sixty years); buildings, £1,950 (thirty years); machinery, cables and crane, £8,550 (fifteen years); pressed steel poles and services, £1,100 (fifteen years); switchboard, £510 (seventeen years); public lighting, £460 (ten years); battery, £890 (seven years); meters, £200 (five years); total, £14,000. The repayment of principal and interest will amount to about £1,280 per annum. It is hoped to publish a detailed description of the scheme at a later date, but the general features are as follows:—

The generating station is of pressed bricks with Portland stone dressings, and contains engine-house, with temporary end to hold three sets of Diesel engines of 150-b.h.p., battery-room of two floors, offices, workshop, store-room, meter test-room and cooler-house. The machinery comprises two Diesel sets of 150-b.h.p. each, direct-coupled to the 100-k.w. generators, booster, balancer, and motor-driven cooler and softener. There is a separate network of cables for public and private lighting. Other items are a battery of 270 cells (135 on each floor), having a capacity of 300 amp.-hours at the four-hour rate, with glass boxes large enough to add plates to 500 amp.-hours; also switchboard, with spare panels for extension, and a 6-ton overhead traveller.

The undertaking starts with good prospects of success, the probable demand of the London and South-Western Railway Company being 80,000 units per annum, while a good day load is anticipated from the various factories in the town. The system of supply is continuous current at 460-230 volts.

Mr. G. Broadhurst, A.M.I.E.E., who has acted as clerk of works on the undertaking, has been appointed as resident electrical engineer, and takes over the future charge of the works.

At the commencement of last week's proceedings, the Mayor of Basingstoke, Mr. Councillor Cannon, J.P., gave a brief account of the various stages of the movement of which that ceremony was the complement, and remarked that the station was expected to be a success financially; beyond that it was hoped that the electric lighting and power would lead to the establishment of new industries in the town. His Worship then called upon the borough engineer, Mr. F. Reginald Phipps, Assoc.M.Inst.C.E., F.S.I., who, in a few well-chosen words of compliment, presented to the chairman of the Lighting Committee, Mr. Councillor Tigwell, a handsome silver-gilt key, bearing a commemorative inscription and the borough coat of arms. After thanking the mayor and Mr. Phipps for the honour, Mr. Tigwell unlocked the door of the new building. Subsequently Mr. Tigwell continued his



Engine-room, Basingstoke Electricity Works.
(Showing two Diesel Sets of 150-b.h.p. each.)

they had carried out the work, and the borough engineer for his devoted service in the whole matter.

[illegible] confidence they had placed in him in allowing him to [illegible] He was [illegible] thanks to all who had rendered him such great assistance in the work. First of all he wished to thank his old friend Mr. Morgan, [illegible] the contract [illegible] Mr. Drummond, he should also like to express his great thanks for the assistance he had rendered in the building part of the work. He acknowledged also the services of the quantities surveyors, Messrs. Smith and Bryant, and desired to add his thanks to the contractors, who, in his opinion, had done their work in a most satisfactory manner. He was sure that the building was put together in a solid and substantial [illegible] would last many years. The whole of the machinery and plant was, in his opinion, everything that could be wished, and if they were to start [illegible] in regard to which they could make improvements.

The machinery was afterwards started by the Mayor.

The photos which we are able to reproduce are by Terry Hunt, Basingstoke.

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.

CLOSSARY OF ROAD TERMS.

To the Editor of THE SURVEYOR.

SIR,—I must apologise for not having replied earlier to Mr. H. Percy Boulnois' letter dealing with [illegible] of his "Glossary of Road Terms." I am much gratified to learn that Mr. Boulnois considers my review to be "exactly the description of criticism necessary to make the book useful," though I would prefer to say "even more useful than it is at present." Mr. Boulnois' most valuable qualification in this matter is his judicial attitude of mind, which enables him to recognise the value of sound criticism, however keen, and to perceive the weak points in proposed alterations.

Dealing now with the various points in his letter: I give first my suggestions for defining the four words in his third paragraph.

PUN.—To ram or beat earth, concrete, &c., into place, ramming it locally, rather than as a mass or from above.

PUNNER.—A rammer, usually of relatively small diameter.

PUG MILL.—A machine in which horizontal arms rotate in a cylinder or barrel; used for mixing clay, mortar, &c.

SCARIFY.—To loosen or to break up the surface of a carriageway—(1) with picks; (2) by the ploughing action of tines attached to a steam roller or other travelling machine.

DRAG.—See "Skid-pan" and "Road-drag."

SKID-PAN.—A small iron sledge or shoe on which the wheel of a cart or wagon rides when descending hills.

ROAD-DRAG.—A machine consisting of two half-round or sawn timbers, connected by cross-pieces [the front timber being usually provided with an iron cutting edge], pulled along an earth or gravel road by horses, squarely for smoothing, and on the skew for shifting material to or from the centre.

As regards the word "crust," I maintain that it is inadvisable to regard it as distinct from a bottoming or foundation. The separate foundation principle is usually a wrong one, the so-called concrete foundation provided for carpets of wood or asphalt being in fact the crust.

It might be defined thus:

CRUST.—The [illegible] layer of material put down to form the carriageway of a road; but not including [illegible] in macadam road bodies [illegible] "artificial crust."

As regards the next three words: The definition of "invert" is good as far as it goes; but as the word appears to be [illegible] and [illegible] diameter, the definition needs extending. As regards "lagging," my point is that the first part of the definition should not seem to restrict the use of the word to tunnel work. Certainly it applies to bridge work, not only for arches, but also for other kinds of [illegible] and [illegible] meanings.

The term "brick" is a matter of principle. A definition should not be made by using words which are less well-known than the term defined. I would propose this:

STRUT.—A compression member or a stay-bar or tie. A post or [illegible] either exerting an end thrust.

To strut.—To prop, to support with timber.

STAY.—A rope, wire, or chain, steadying a post or other structure by exerting a pull.

BOOM.—(On land), an inclined beam or mast, or pair of such.

DERRICK.—A boom, supported by posts and stays.

With regard to geological terms and "trade names," I note that Mr. Boulnois does not defend his glossary, nor the Standard Committee. *Their* position is, indeed, indefensible—unless "might is right." Topographical terms, Mr. Boulnois agrees, might be dealt with more fully. I think that he will find many that should be added, and I hope that in a later edition of his work he will be disposed to give the space needed to allow of law and administrative terms being included.

Mr. Boulnois has me fairly with regard to the word "swim." It would only be used in answer to the question "When is a ford not a ford?" (By the way, "ford" is not in the glossary.) What I meant to point out with respect to "immerse," "decay," "charge," and similar words, was this: If words such as "spread" and "decay" are not regarded as too well-known for inclusion in a glossary of *road terms*, why not include such words as "carry" and "load"?

Either the glossary should be made larger by adding a number of generally useful words, or, logically, space may be found for longer definitions of road terms by throwing out words the meanings of which ought to be generally understood.

The telegraph boy, O.H.M.S., interrupts what I was going to write in acknowledgment of Mr. Boulnois' exceedingly courteous treatment of a fault-finding reviewer, and as the matter is urgent I must close this letter at once.—Yours, &c.,

YOUR REVIEWER

October 6, 1914.

THE LIMMER ASPHALTE PAVING COMPANY.

To the Editor of THE SURVEYOR.

SIR,—It has been brought to our notice that there exists in the minds of some of your readers some misconception as to the constitution of this company and the composition of our board of directors.

We hope, therefore, you will allow us to make the following authorised statement:

(1) The company, which was established in 1871, is entirely British owned, and none of its shares are held by either Germans or Austrians.

(2) Our freehold mines, some hundreds of acres in extent, purchased twenty years ago, are situated in the Bassin de Seyssel, Haute Savoie, France.

(3) We own no property whatever in either Germany or Austria.

(4) Our principal supplies of asphalte for damp-course, roofing and flooring, &c., are drawn from our own mines in France, and for compressed asphalte carriageway work from the well-known mines at Ragusa, Sicily.

(5) Our supplies of bitumen for our general business, and for the manufacture of our well-known "Bitma" [illegible] and bituminous compounds, and our "Bitmarin" bituminous specialities, are drawn principally from British colonies, and we never, under any circumstances, purchase the artificial so-called "bitu-

[illegible] imported into this country from Continental sources.

We employ at our London works and branches in Liverpool and in Paris several hundreds of workmen, and we have offered to build, on our staffs and our workmen in both countries every facility for joining the colours, and have arranged that none of the dependents of our people shall be left in want.

(7) Our business is entirely British managed, and we have had a large Government of Australia in our employment in any part of the world.

(8) Our directors are: Henry Holloway, Esq., J.P., chairman; H. D. Blake, Esq., managing director; Sir Courtauld Thomson; G. R. W. Wheeler, Esq.

We trust that the above information will make our position clear to your readers.—Yours, &c.,

THE LIMMER ASPHALTE PAVING CO., LTD.
G. Mitchell, Secretary.

MUNICIPAL HOUSING AND THE EMPLOYMENT OF LABOUR.

To the Editor of THE SURVEYOR.

SIR,—With reference to your reader in THE SURVEYOR of October 9th, I have recently built eight [illegible] on first floor) by direct labour for my council.

The cost of the buildings was £1,330.

Labour represented approximately 40 per cent and materials 60 per cent of the cost.—Yours, &c.,

JOHN L. REDFERN,
Borough Surveyor.

Gillingham.
October 15, 1914.

[In the note referred to by our correspondent reference was made to the opinion, which is widely held, that the carrying out of housing schemes would [illegible] building work, and there [illegible] The question as to the relative amounts spent on labour and materials was raised, and it was suggested that information regarding a semi-detached cottage, built in a medium-sized or small provincial town at a cost of about £200, reckoned on a basis of 4½d. per foot cube, apart from levelling and fencing, but including drainage, would be specially useful.—Ed. SURVEYOR.]

Rosyth's Proposed Boulevard.—Among the features of the Rosyth town planning scheme are included three great roads to radiate from a common centre in [illegible] One of these will be a boulevard 100 ft. wide and 1,000 yds. long.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Do [illegible] Royal Sanitary Institute in training the 750 men [illegible] have been in the employment and [illegible] It is also remarkable that there have been 10,000 attendances at the various lectures and demonstrations, and that all this work has been carried on voluntarily by the staff and the professional men who volunteered their services? Is not this an example of patriotic effort which might well be followed by other institutions?

* * * *

Why is it that recruiting is so backward in many of our rural districts—especially in the West of England? Is it because the people in country villages do not realise the gravity of the crisis through which we are now passing, and that unless they bestir themselves their hearths and homes, and even their lives, are jeopardised by their inaction? What can be done to put a little more patriotic life into these people?

* * * *

How is recruiting going on for the 2nd London Sanitary Company, about which Captain Arthur J. Martin wrote to THE SURVEYOR about a fortnight ago? Does it not seem to be the exact line that should be taken up by a young man who is anxious to do something for his country, and at the same time to keep in touch with his profession? Are there not a large number of engineering and architectural assistants who are now out of work owing to the war and who would find it worth while to write to Captain Martin at the Duke of York Schools, Chelsea, and make some inquiries as to this corps with a view to joining?

* * * *

Is not the little town of Hinckley, in Leicestershire, an example of what can be done in a district of only 13,250 inhabitants when under able and energetic management? Was it not refreshing to hear from Mr. Crump, the surveyor, at the district meeting a few weeks ago, that this small town already possessed its own gas and water works, that it also had public baths, a free library, an excellent system of sewerage and sewage disposal works, and that it has embarked on an excellent housing scheme? Could we not say to other towns of this or even greater size: "Go thou and do likewise"?

* * * *

Why is it that so many of the less important roads and lanes in this country, especially in Devonshire, are so much below the level of the adjoining land? Is it, as has been stated, because in former days each farmer in turn had to plough up the surface of the roads, thus making them lower and lower? If this is a fact, what became of the soil that was removed? Is there anyone who can give a really satisfactory solution of this problem?

* * * *

Is it not rather astounding to read in the daily papers of a certain large manufactory suspected of being merely a platform on which heavy siege guns could be placed for use against London? While not convinced as to the accuracy of the theory advanced in this particular case, may there not be constructions of the kind alleged in other parts of the country, and should not the local surveyors and building inspectors be able to give some valuable information to the police or other authorities where they suspect that such buildings have been erected or are in course of erection?

* * * *

Is there not a good deal worthy of consideration in Mr. Hartfree's suggestion for the formation, if possible, of a "Municipal Engineers' Technical Reserve" during the war? Is it not possible that there may be a considerable number of surveyors or engineers in municipal employment throughout the country who have some special technical knowledge that would be of great value to the War Office, if these men could be discovered and enrolled in a corps?

Assistants' and Students' Section.

Conducted by SYDNEY G. TURNER, Assoc.M.Inst.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

Mr. N. S. Jeffrey, of Darlington, has selected in respect of the September premium

Church's "Graphic Statics" (vols. 1 and 2 (Halden);

Mitchell's "Advanced Building Construction" (Batsford);

Larard & Golding's "Practical Calculations for Beginners" (Griffin);

and these books have been duly sent to him.

QUESTIONS.

This week answers are invited to the following questions:

430. Materials.—In what respects do Portland and Roman cements differ, and in what circumstances is the latter used? ("Beginner.")

431. Water Supply.—Explain the difference between surface springs and deep springs, and state the geological conditions in which each occur.

432. Ventilation.—What is the distinction between "natural" and "artificial" ventilation?

433. Mechanics.—Show how to find the periodic time of one complete vibration in a case of simple harmonic motion, and give a proof of the necessary formula.

434. A Question in Statics.—A light rod, of length 3 ft., whose weight is neglected, has equal weights attached to it, one at 9 in. from one end and the other at 15 in. from the other end. If it be supported by two vertical strings attached to its ends, and if the strings cannot support a tension greater than the weight of 1 cwt., what is the greatest magnitude of the equal weights? (H. P. M., *Towyn.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

425. Strength of Materials.—Explain why the resistance of a long strut depends more on the stiffness of the material than on its strength.

A short strut, say of 3 or 4 diameters in length, would fail under compression, due to the direct compressive stress. In the case of a long strut the failure is largely due to the bending stress as well as the direct compressive stress. Anything which stiffens the strut against bending obviously will strengthen it; and for this reason columns are made of hollow circular section, or built up with L irons or T irons, so as to have great resistance to bending. Fixing the ends of a strut also increases the resistance to bending.

Struts are usually proportioned by the Rankine formula, which is based on experiment:—

$$\frac{W}{A} = \frac{f}{1 + a\frac{l^2}{k^2}}$$

wherein—

W = buckling load in tons.
A = Area of cross-section.
f = Working stress in tons per square inch.
l = Length of strut in inches.
k = Least radius of gyration, also in inches.
a = A constant.

The fraction $\frac{W}{A}$ clearly represents the resistance of the strut. Now, for a given case, we know that a, l, and k are all constant, and we may therefore write the formula:—

Resistance is proportional to working stress.

In other words, the resistance is directly proportional to the strength of the material.

Now we have used the expression "radius of gyration." This factor is directly connected with the moment of inertia of a section by the formula—

$$I = \frac{W}{g} k^2$$

wherein—

I = Moment of inertia of strut about its axis.
W = Weight of strut.

And for a given case W and g are constant, and hence $I \propto k^2$, *i.e.*, moment of inertia $\propto$ (radius of gyration)^2.

Now, from the Rankine formula we also notice that for a given case the resistance is proportional to the square of its radius of gyration, which, in its turn, is proportional to the moment of inertia—*i.e.*, the stiffness of the strut.

Hence, if we increase the radius of gyation, the stiffness of the material is proportionately increased as the *square* of the radius—*i.e.*, the resistance of the strut is more dependent on its stiffness than on its strength. (T. W. P., *Bexhill-on-Sea.*)

429. Mechanics.—A pair of blocks have three sheaves in the upper and two in the lower block. Find the pull required to raise ¼ ton, assuming ⅗ of the energy wasted.

For a pulley of this type we have—

$$nP = W + w$$

where P = effort required
W = load
w = weight of lower block
n = number of pulleys.

In this case, therefore, neglecting w (which is taken into account in the correction for energy wasted)

$$5P = \frac{2240}{4} \text{ lb.}$$

$$\therefore P = \frac{2240}{5 \times 4} \text{ lb.} = \text{theoretical effort.}$$

But $\frac{2}{5}$ of the total energy is wasted.

$\therefore$ the above theoretical quantity P = $\frac{3}{5}$ actual effort.

$$\therefore \text{actual effort} = \frac{5 \times 2240}{5 \times 4 \times 3} = 186\tfrac{2}{3} \text{ lb.}$$

(B. K., *Hayes.*)

Note.—P. T. (*Middleton*) has been credited with the answer from which his initials were inadvertently omitted last week.

Royal Institute of British Architects.—The first ordinary general meeting of the session will be held on Monday, November 2nd, when the chair will be taken by the president, Mr. Ernest Newton, R.A., at 8 p.m. The president will briefly address the meeting, and make an announcement respecting the prizes and studentships, 1915.

Chadwick Public Lectures: War Programme.—The Chadwick Trust have arranged a series of lectures on military hygiene. On November 14th, 21st and 28th, at 3 p.m., at Bedford College, Regent's Park, N.W., Dr. A. T. Nankivell will deal with "Camp, Ship and Hospital Hygiene"; on December 4th and 11th, at 8.15 p.m., Sir Ronald Ross will lecture at the London School of Economics, Clare-market, Kingsway, W.C., on "Government and Military Sanitation in the Tropics"; and on January 15th, 22nd and 29th, at 5.15 p.m., Dr. F. M. Sandwith will deliver lectures at the Royal Society of Arts, Adelphi, W.C., on "War and Disease." Further particulars of these and other lectures can be obtained from the Secretary to the Trust, 8 Dartmouth-street, Westminster.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction, i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

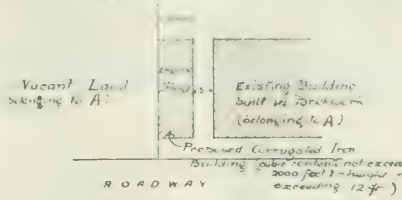
HIGHWAY BRIDGES OVER RAILWAYS AND CANALS.—"J. W." writes: I understand that by a recent decision a local authority can call upon a railway or canal company who are the owners of and responsible for the maintenance and repair of any bridge by means of which roads or streets are carried across a railway or canal to reconstruct the bridge if it is not strong enough to carry the increased traffic which has grown up since the bridge was constructed. I should be glad if you would inform me if there are any decisions whereby a local authority can call upon a railway or canal company to widen a bridge which, although strong enough to carry the increased traffic, is not wide enough to take such traffic without serious inconvenience. In this district there is such a bridge 12 ft. wide, and since its construction some fifty or more years ago the narrow roads or footpaths leading to it have been laid out by the abutting owners as streets 36 ft. wide. These streets are now fully built on, and the bridge, although strong enough, is a serious obstruction to the traffic on the street. Can the local authority call upon the railway company to widen this bridge?

There are two recent decisions as to the standard of repair of bridges—one relating to a bridge over a canal, and the other to a bridge over a railway. See *Wigan Coal & Iron Co. v. Sharpness, &c., Company* (page 520 of vol. xlv. of THE SURVEYOR), and *Simms v. Great Northern Railway Company* (page 269 of the same vol.). With regard to bridges carrying highways over railways, by sec. 51 of the Railways Clauses Consolidation Act, 1845, if the width of the road is increased the company must widen the bridge at their own expense to such extent as the highway authority may require, not exceeding the maximum width prescribed by sec. 50—viz., 35 ft. for a turnpike road, 25 ft. for a public carriage road, and 12 ft. for a private road (unless otherwise provided by the special Act). This Act, however, does not apply to bridges over canals, and in the absence of any provision in the special Act under which the canal was made it would appear that the canal company cannot be compelled to widen such bridges.

WATER SUPPLY: CEMETERY.—"Church" writes: There is a cemetery without a water supply for drinking purposes, which is used by the inhabitants of every creed in the parish, but which is held in charge by the church: the vicar receives the rent as part of his stipend), and in the yard there is a pump well, which is the only supply the inhabitants can use for drinking purposes when visiting the cemetery. An analysis of this water has been taken, and it is condemned as unfit for use. The council's water main is about 800 yds. away from the farm and cemetery, and the cost of taking a one-inch pipe for both places would be £60. The vicar of the parish contends that it would be unfair for him to spend this amount for his farm, as the people would go into his yard, as they do at present, for water. My water committee agree with him on this point. Have the Rural District Council power to spend, say, two-thirds of the cost of taking the water to the cemetery (not to the farm), and to ask the vicar to spend the other third to supply his farm?

In my opinion the council have power, under sec. 51 of the Public Health Act, 1875, to bring their main to within a reasonable distance of the cemetery and farm (assuming these are not within the limits of supply of any water company). Having done so, they can then compel the owner of the farm to take a supply under sec. 62 of the Act; or, alternatively, under sec. 3 of the Public Health (Water) Act, 1878, they can compel him to take a supply if the cost of executing the necessary works will not exceed £8 13s. 4d., or such other sum, not exceeding £18, as the Local Government Board determine to be reasonable. If there is an occupied dwelling-house at the cemetery, the owner thereof could be compelled to take a supply in the same way.

BUILDING BY-LAWS.—"Corrugated" writes: Plans have been deposited for the erection of a corrugated-iron building in the position shown on sketch, the proposed building to be used as an engine shed. I would like your opinion as to whether a council would be justified in refusing to pass the plan as not being in accordance with the following by-law relating to "iron building": "(1) Any building comprising not more than one story—(*a*) The external walls of which shall be constructed of, or wholly covered with, galvanised, corrugated, or other sheet iron; (*b*) which shall not exceed in height 12 ft. as measured from the level of



the ground adjoining the walls to half the vertical height of the roof, and shall not exceed in extent 2,000 cub. ft.; (*c*) which shall not be constructed or adapted to be used either wholly or partly for human habitation; (*d*) and shall be distant at least 10 ft. from the boundary of any adjoining lands or premises."

In my opinion the proposed building does not conform to clause (*d*) of the by-law, and the council would be justified in disapproving the plan.

HIGHWAY: RETAINING AND FENCE WALLS.—"W. R. D." writes: In this district there are several places where the highway is on a higher level than the adjoining land, and is supported by a retaining wall, and I shall be obliged if you will advise me: (*a*) Is the highway authority or the landowner responsible for keeping the retaining wall in repair? (*b*) Where a fence wall is erected on top of the retaining wall, is the highway authority or the landowner responsible for its repair? This refers to a fence wall which cannot possibly be of any use for confining the stock in the fields, the road being anything from 6 ft. to 12 ft. higher than the land, and I might say that I am unable to trace by whom the walls were originally erected.

(*a*) **The easement of support derived from a retaining wall implies, in the absence of proof to the contrary, a duty on the part of the highway authority to repair the wall. The landowner would not be liable in the absence of proof of a prescriptive obligation on his part. (Copnall's "Law Relating to Highways," 2nd edition, pp. 264, 265.)** (*b*) **As a general rule there is no obligation on the part of the highway authority to repair a fence wall adjoining a highway. But where a fence or wall protecting a highway against a precipice forms part of the highway the authority are liable if such fence or wall is suffered to become dangerous by reason of non-repair. Whether or not the wall is part of the highway is a question of fact for a jury to determine (*Scott*, p. 261). Unless sec. 30 of the Public Health, &c., Act, 1907, is in force in the district, the landowner cannot be compelled to repair the wall, but if it is his wall, and not part of the highway, and gets into such a dangerous state as to be a public nuisance, he would be liable to pay damages to anyone suffering injury in consequence. (See *Harrold* v. *Watney*, 1898, 2 Q.B., 320.) If sec. 30 of the Act is in force in the district, and the wall is for want of sufficient repair dangerous to passengers, the landowner can be compelled to repair it, or to repay to the authority the cost of its repair, assuming that the wall is his property and not part of the highway.**

BY-LAWS EXTERNAL WALLS.—"By-law" writes: I shall esteem it a favour if you will let me have your answer to the following: A plan of two houses, B and C, was submitted to me for approval. There is an entry between the two houses, and the chamber floors are carried over it. Along the entry is shown 4½-in. brick walls to the front room of house B, and the back room of house C. Enclosed are by-laws in force within the district. (1) Do you not consider the 4½-in. walls to be walls which enclose the said parts of the two houses, and is it not immaterial whether walls are exposed to the atmosphere or adjoin some other building which forms no part of the premises; that these

[illegible] walls are external walls. (2) Do you consider the [illegible] walls in the party to be external walls within the meaning of the bye-laws?

[illegible] external wall is defined in the bye-laws as meaning an outer wall of a building not being a party wall even though adjoining the wall of another building. In my opinion the [illegible] walls are external walls within this definition and within the meaning of the bye-laws.

[illegible] Planning Scheme—New Main Road. [illegible] the Borough Council is about to prepare a scheme under the Housing and Town Planning Act, 1909, for the purpose of constructing a new main road through the Borough, and that the effect of the proposed scheme will be to injuriously affect certain property through which the road would run objects [illegible] to the proposed scheme. If they can make out a case, will they have to pay compensation when the scheme is carried out?

Under sec. 5, subsec. (1) (c) of the Housing and Town Planning Act, 1909, the authority may, after giving such notice as provided by the scheme, and in accordance with the provisions of the scheme, execute any work which it is the duty of any person to execute under the scheme in any case where it appears that delay in the execution of the work would prejudice the efficient operation of the scheme. If the scheme imposes the duty of constructing the main road on any person or persons this provision will apply. Any person whose property is injuriously affected will be entitled to compensation under sec. 58, subject to the limitations specified in sec. 59.

SOME RECENT PUBLICATIONS.*

Applied Mechanics. Vol. I. Statics and Kinetics. By Charles E. Fuller, S.B., and William A. Hanson, S.B., Professors of Theoretical and Applied Mechanics, Massachusetts Institute of Technology. Price 10s. 6d. nett. London: Chapman & Hall, Limited.

This work is intended "primarily for students who have had a preliminary training in the fundamentals of mechanics, in a course in physics, and also in a course in the elements of mechanism." Underlying theory is discussed "in so far as it will help to elucidate the principles which are required in the solution of problems in engineering. . . ." The methods of the calculus have been employed "when these appear to furnish the most direct method of analysis. In general, however, only the simpler operations in differentiation and integration are required." A large number of problems are included, but the answers are, unfortunately, not given except "when it was deemed necessary to indicate the methods of applying the principles." The practical value of the book would have been considerably increased by the addition of a list of answers to those problems which are not worked out in the text. The authors seem, however, to have carried out successfully their main purpose. The various theorems of the subjects included are stated clearly, the methods of analysis are direct and are very clearly set forth, and the practical applications are of a really useful character. Equations and physical constants relating to various dispositions of area and mass are so printed as to be readily found, in close connection with the demonstrations of the methods by which they are determined. The printing throughout is excellent, and the diagrams, of which there are 241, are very well drawn. The book may, therefore, be recommended to engineers.

Some of us will not be able, however, to commend the author's treatment of basic principles. They recognise five fundamental conceptions of mechanics [illegible] space, time, matter, and force. Many of us consider that three of these are enough. Given space, time, and visible matter, the idea of motion may be derived. Given time and differences in space, or space and differences in time, we can conceive of force as a property related to matter, or of matter as a property or condition related to force. Again, the distinction between "stress" and "intensity of stress" is unhappy. The authors define "stress" as "a force exerted at a surface of contact of two contiguous bodies, or at a section between two parts of the same body." What they call "intensity of stress" is what British engineers call "stress," or "force per unit area." This is the same thing as "intensity of force." The authors are not consistent in this matter, for they use the term [illegible] when they mean, in their terminology, "uniform intensity of stress." In view of the nature and purpose of the book this criticism is, however, of little moment.

For the convenience of readers who keep reviewing references, it is worth while to note how the space is filled—380 pages. Introductory, including systems of units—composition of forces and fundamental theorems of space, time, and matter, 15 pages. Statics—forces in a plane, 45 pages; forces not in one plane, 23 pages; distributed forces, 23 pages. Centre of gravity, 25 pages. Moment of inertia, 48 pages. Kinetics—kinematics, kinetics of the particle, 44 pages. Work, power, and energy, 27 pages. Friction, 35 pages. Kinetics of rigid bodies having plane motion only, 62 pages. Impact, 16 pages. Index, 18 pages.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

PRO PATRIA.

[SEVENTH LIST.]

We present herewith a seventh list of municipal engineering and sanitary officials who are taking part in the war, and shall be glad to hear of other cases within the knowledge of our readers.

Abney, Thos. W., assistant clerk, Grimsby Corporation, "Chums" Battalion, Grimsby, Lord Kitchener's Army.

Baxter, John R., engineering assistant, borough engineer's department, Grimsby Corporation, "Chums" Battalion, Grimsby, Lord Kitchener's Army.

Broadhead, Norman, late engineering assistant, borough engineer's department, Grimsby Corporation, Argyll and Sutherland Highlanders.

Brook, C. V., pupil of Mr. Andrew Warren, borough surveyor of Totnes, lance-corporal in the Royal Engineers at Chatham.

Clarke, J. H., engineering assistant, borough surveyor's department, Lancaster, 7th Battalion, Royal West Kent Regiment (Kitchener's Army).

Collins, John, assistant clerk, Grimsby Corporation, "Chums" Battalion, Grimsby, Lord Kitchener's Army.

Deas, Edwin H., engineering assistant, Dundee city engineer's department, Scottish Horse.

Ellis, A. R., clerk, Derby Corporation, 1st North Midland Field Ambulance, Royal Army Medical Corps.

Farrington, T. B., engineering assistant, Derby Corporation, 5th Battalion Notts and Derby Regiment (Territorials).

Fisher, Robert M., engineering apprentice, Dundee city engineer's department, Scottish Horse.

Fitzgerald, M. E., highway surveyor to the Warmley Rural District Council, South Midland Royal Engineers.

Forwell, Ernest S. W., engineering assistant, Dundee city engineer's department, Scottish Horse.

Hunter, Arthur T., engineering apprentice, Dundee city engineer's department, Scottish Horse.

Hutton, George M., engineering assistant, Dundee city engineer's department, Scottish Horse.

Keith, Lindsay S., clerk, Dundee city engineer's department, Scottish Horse.

Lawrence, Robert F., engineering assistant, borough engineer's department, Grimsby Corporation, Engineers' Units, Royal Naval Division.

Mason, Charles W., assistant clerk, borough engineer's department, Grimsby Corporation, "Chums" Battalion, Grimsby, Lord Kitchener's Army.

Michell, W. H., architectural assistant, Derby Corporation, Second Lieutenant, 12th Battalion Notts and Derby Regiment (Lord Kitchener's Army).

Milne, David S., engineering assistant, Dundee city engineer's department, Scottish Horse (motor cyclist).

Philip, Adam, engineering assistant, Dundee city engineer's department, Scottish Horse.

Weir, Francis B., clerk, Dundee city engineer's department, Scottish Horse.

Mr. Walton Maughan, Northampton, has joined the Royal Fusiliers.

Mr. A. B. Lowrie, of the Roads Improvement Association, has joined the Army Service Corps for the duration of the war.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Barking U.D.C. (October 2nd. Major J. Stewart). £4,300 for the purchase and fencing of land forming part of the Eastbury estate for purposes of a playing field, and £5,220 for the widening and improvement of Ripple-road, Barking.—The acting surveyor, Mr. R. A. Lay, supplied details of the proposed schemes.

Bulkington U.D.C. (October 14th. Mr. R. G. Hetherington).—£8,500 for purposes of sewerage and sewage disposal.—Mr. F. C. Cook, engineer, said that, unfortunately, the undertaking was a costly one, having regard to the population of the district. The scheme would be ample for the requirements of Bulkington for many years to come. The inspector observed that Bedworth sewage works were close to Bulkington, and it had occurred to him that perhaps the Bulkington scheme might be worked in connection therewith. Dr. Bostock Hill, the county medical officer, pointed out that Bedworth was developing, and would probably require all the land at the sewage works for itself. Dr. Hill supported the scheme on behalf of the county council.

Chailey R.D.C. (September 29th. Mr. P. M. Crosthwaite).—£1,300 for the purpose of sewerage and sewage disposal for the village of Cooksbridge.—The engineer, Mr. H. Bertram Nichols, M.INST.C.E., submitted the plans and explained them in detail. The scheme, he stated, was practically on the same lines as schemes he had carried out in two other districts with satisfactory results.

Darwen T.C. (October 13th. Major J. Stewart). £6,550 for the rebuilding of the public baths in Church-street, which were erected in 1854.—The town clerk, Mr. W. P. Halliwell, stated that the accommodation provided would meet the requirements of the town for many years.

Lisburn R.D.C. (October 14th. Mr. P. C. Cowan). £5,000, to meet the extra expenditure incurred as compensation for wayleaves, arbitrators' and valuers' fees, and legal costs in connection with the Balmoral sewerage scheme. The total cost of the scheme was £13,500, and a loan of £8,500 had already been sanctioned and issued.—The inspector stated that he had inspected the work, which was very excellent, and would efficiently serve the purpose. Mr. James Hunter, engineer, gave details and the inquiry closed.

Yarmouth T.C. (October 13th. Mr. M. K. North). £1,140 for swimming baths, £4,500 for lawn and sea-shore promenade, and £16,000 for the extension of the Marine-parade North to the road leading to Caister Railway Station.—The borough surveyor, Mr. J. W. Cockrill, stated that baths would be placed on the gardens north of the Britannia Pier, and it would be a plain building of concrete, faced with glazed tiling. There was no bath accommodation in the town, and in proportion to the population there were fewer baths in the houses in the town than in any town in the country. With respect to the second scheme, the borough surveyor explained that it was an extension of the work done along the front, which formed one of the principal attractions and features of Yarmouth. These gardens also saved sand being blown on to the drive. He did not suggest in this scheme any gardening, but that the land be laid out simply as a lawn. As to the proposed road extension, it was stated that at the present time there were 4 miles of parade nearly completed in Yarmouth, and that if the scheme were carried out there would be 5 miles, from the harbour's mouth to Caister.

APPLICATIONS FOR LOANS.

Blaydon U.D.C. £2,350 for road schemes.

Bollington U.D.C. £350 for the purposes of the recreation ground and river diversion.

Christchurch T.C.—£800 for surface-water drainage.

Clayton West U.D.C.—£5,739 for sewerage and sewage disposal works.

Essex C.C. £2,620 for sinking a borehole and other works.

Hastings T.C. £1,298 for the purchase of six Candy patent filters and an aerating plant.

Magherafelt R.D.C. £15,430 for labourers' cottages.

Mansfield T.C.—£7,400 for the provision of working-class houses, and £4,000 for gas stoves.

Oldham T.C.—£8,255 for new bowling greens, laying out a recreation ground, and street improvement.

St. Ives T.C.—£1,188 for the Stennack-road improvement.

Southampton T.C.—£3,360 for the erection of workmen's houses.

Southport T.C. £25,000 for the electricity undertaking.

Taunton T.C. £3,000 for a swimming bath and slipper baths.

Walsall T.C.—£23,595 for electricity purposes.

LOANS SANCTIONED.

Aberdare U.D.C. £2,100 for a stores depot.

Axminster R.D.C.—£11,000 for sewerage and sewage disposal works.

Bedwas and Machen U.D.C.—£2,386 for the erection of a new council office.

Bermondsey B.C.—£2,000 for electricity mains and meters.

Blackwell R.D.C.—£20,000 for the Shirebrook housing scheme.

Bollington U.D.C.—£300 for laying gas mains.

Brierfield U.D.C.—£500 for electricity mains and services.

Bromley T.C. £6,000 for widening Market square.

Bury T.C.—£1,400 in respect of street widening.

Chelmsford T.C.—£1,150 (repayable in sixty years) and £600 (repayable in fifteen years) for the purchase of land adjoining the sewage farm.

Cottingham U.D.C.—£2,900 for works of sewerage.

Disley R.D.C. £2,424 for works of sewage disposal.

Edmonton U.D.C.—£1,700 for road widenings.

Hipperholme U.D.C.—£1,475 for a road improvement.

Hythe T.C.—£300 for water mains extension.

Kirbymoorside R.D.C.—£6,049 for works of water supply.

Northwich U.D.C.—£304 for water main extension.

Oswestry R.D.C. £1,100 for works of water supply.

Paignton U.D.C.—£2,537 for the extension of the isolation hospital.

Shoreditch B.C.—£4,300 for road improvement.

Southampton T.C.—£27,350 for works of water supply, £20,350 for a reservoir, £2,000 for mains, and £5,000 for wells and headings.

Woking U.D.C. £5,800 for a housing scheme.

FORTHCOMING INQUIRIES.

OCTOBER.	£
26. **Wallasey.** For the erection of houses (Mr. Courtenay Clifton)	11,546
27.—**Arnold.** For the provision of a park (Mr. Edgar Dudley)	3,500
27.—**Bispham.** For private street improvement (Mr. M. K. North)...	12,000
27. **Bournemouth.** For the undercliff improvement (Mr. P. M. Crosthwaite)	5,000
27.—**London.** For an improvement scheme (Mr. W. H. Collin)	
27.—**Sedbergh.** For the erection of houses (Mr. Courtenay Clifton)	3,200
27.—**Sheringham.** For surface-water drainage (Mr. R. H. Bicknell)	900
27.—**Winchcomb.** For the erection of houses (Mr. H. S. Stewart)	2,565
28. **Chorley.** For laying granite setts and private street works (Mr. M. K. North)	8,663
28.—**Haywards Heath.** For laying out a cemetery (Mr. R. H. Bicknell)	500
28. **Swindon.** For works of sewage disposal (Mr. P. M. Crosthwaite)	33,000
29.—**Harrogate.** For private street improvement (Mr. M. K. North)	2,177
29.—**Llantrisant.** For works of sewage disposal (Mr. P. M. Crosthwaite)	9,500
29. **Petersfield.** For street improvement (Mr. R. H. Bicknell)	180
29. **St. Albans.** For the erection of houses (Mr. H. S. Stewart)	1,300

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works, of which particulars appear below: Buildings—Cambridge; Parks—Dunstable; Housing and town planning—Blackwell, Mansfield, Whitehaven, Wombwell; roads and materials—Bermondsey, Grimsby, Stoke-on-Trent, Watford; sewerage and sewage disposal—Coatbridge, Kidderminster; water, gas and [illegible] Oswaldtwistle; key [illegible] Birmingham, Southport. Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Cambridge T.C. The council have approved the [illegible] of £5,500, prepared by the borough surveyor, Mr. J. Lucas, for the proposed additions to the Guildhall, and the necessary steps have been taken to obtain the sanction of the Local Government Board to the scheme. In addition, there will have to be paid sums of £441 and £470, architect's [illegible] charges in respect of plans which were subsequently abandoned.

Dunstable T.C.—The Sanitary Committee have been instructed to report upon a suitable site for an isolation hospital.

Perthshire C.C.—The question of securing a site suitable for a county sanatorium has been referred to the Finance Committee.

Pwllheli T.C.—The council on Wednesday adopted a scheme for erecting a sea wall, parade, and road between South Beach and West-end Parade, at a cost not exceeding £4,000.

Wallsend T.C.—The borough surveyor, Mr. G. Hollings, has prepared plans for the extension of [illegible], at an estimated cost of £2,000.

HOUSING AND TOWN PLANNING.

Bampton U.D.C.—The surveyor, Mr. W. F. Siddalls, reported recently that Mr. Collins, Local Government Board inspector, visited the town on September 17th, and expressed the opinion that more houses were required in Bampton. He also suggested that the council should take steps to find out a good water supply for these houses and prepare plans for the Local Government Board. The inspector appeared pleased with what were termed "the satisfactory houses," of which there were about fifty in the district.

Birmingham T.C.—The council on Tuesday approved the Town Planning Committee's scheme for the North Yardley and Stechford area, and authority was given for the preparation of a scheme for the adjoining South Birmingham area.

Blackwell R.D.C.—The Local Government Board have sanctioned the scheme for the erection of 100 houses at Shirebrook, and for the purchase of the necessary land. The total cost will be £20,000, and sanction was given for the repayment of this amount over the number of years asked for.

Kilsyth T.C.—The council have abandoned the proposal to build tenement houses, and have decided to proceed on the semi-detached cottage system, proposing to build on the tenant-proprietorship principle, which it is expected will be sanctioned by the Government. Competitive plans were under consideration by the Property Committee, who selected one showing a house comprising kitchen, parlour, bedroom, bath-room, pantry, and coal cellar with wash-house outside. There are about nine and a-half houses to the acre. This plan has met with the approval of the Local Government Board in its general principles.

Launceston T.C.—The council on Monday decided to proceed with a modified scheme for the erection of six houses, at a cost of £1,383. The rent will be £13 a year, and the houses will be self-supporting.

Mansfield T.C.—It has been decided to erect on land in Baums-lane forty houses in blocks of four each, half of them to comprise living-room, scullery, two bedrooms, and necessary out-offices, and half of them living-room, scullery, three bedrooms, and necessary out-offices, in accordance with the plans [illegible] of the borough surveyor, Mr. T. P. Gelling; the smaller houses to be let at 4s. 6d. per week, and the larger at 5s. per week. It was stated that the estimated annual charge of the scheme upon the [illegible] is £48. The cost of the land is £975, [illegible] £6,000 and street construction £425.

Middlesbrough T.C.—Consideration is being given to schemes for working-class dwellings, which have been submitted by the borough surveyor, Mr. S. E. Burgess.

Newton Abbot U.D.C.—The council have agreed to inform the Local Government Board that twenty houses are required in the district.

Oswestry R.D.C.—The council have passed plans for the laying out of a garden suburb at Weston Rhyn, a colliery village near Oswestry. The site is large enough for the erection of from seventy to eighty cottages. Each house will have a bath-room.

Prestwich U.D.C.—The council are seeking the sanction of the Local Government Board to a scheme for the provision of eighteen workmen's houses.

Whitehaven T.C.—A scheme has been approved for the erection of ninety-six working-class dwellings.

Wombwell U.D.C.—The question is under consideration of building 100 workmen's houses in Wombwell and Hemsworth.

PARKS AND OPEN SPACES.

Briton Ferry U.D.C.—The Local Government Board have approved the plans of the surveyor, Mr. H. A. Clarke, for laying out the park at Neath-road, and have issued their sanction for the borrowing of £1,800 without holding a public inquiry.

Kirkby U.D.C.—£130 of the sum given by the Duke of Portland is to be expended in laying out the East Ward recreation ground.

Weston-super-Mare U.D.C.—The council have approved a sketch plan submitted by the surveyor, Mr. H. A. Brown, for an improvement of the Beach Lawns between Regent-street and Oxford-street, and Mr. Brown has been authorised to carry out the works when convenient.

ROADS AND MATERIALS.

Bermondsey B.C.—The council have submitted to the Road Board a number of road schemes estimated to cost £20,000.

Bristol T.C.—The city engineer, Mr. L. S. McKenzie, reported recently that the Road Board had definitely intimated that they would grant £1,000 towards the cost of widening Avonmouth-road between West Town-road and Cook-street, and £800 towards the cost of widening Gloucester-road between the barracks and the city boundary, the grants in each case being one-third of the cost of the works, exclusive of the purchase of the necessary land. They also stated that the Local Government Board had intimated that it was desirable to set in motion road improvement works in Bristol to provide employment, and asked that the Avonmouth-road work be now put in hand, leaving the date for commencing the Gloucester-road work to the discretion of the corporation.

Chard R.D.C.—A resolution has been passed to call the attention of the Works Committee of the county council to the need for effecting an improvement in front of Park-terrace, Crimchard, by widening the road, the land for which has already been given.

Chesterfield T.C.—Properties costing £13,463 are to be purchased for the Lordsmill-street and Vicar-lane improvement schemes.

Cornwall C.C.—The county surveyor, Mr. L. W. Thompson, submitted recently a report to the Main Roads Committee on the proposed new road to Mevagissey, and he was authorised to proceed with the necessary engineering arrangements.

East Lothian C.C.—In connection with the scheme for the construction of an improved road over the Lammermoor Hills, plans have been prepared for a deviation round the hill known as the "Hungry Snout," at an estimated cost of £1,000. It is under-

stood that the cost will be covered by a grant from the Road Board.

Edmonton U.D.C.—Contributions amounting to £523 will be made by the Road Board and the Local Government Board towards the cost, estimated at £11,200, of the Silver-street improvement.

Flaxton R.D.C.—The council have submitted to the Road Board a number of road improvement schemes, which, it is estimated, will cost £2,523.

Grimsby T.C.—Towards the Weelsby-road improvement, estimated to cost £10,000, a grant of £5,000 has been sanctioned by the Local Government Board.

Harwich T.C.—It is announced that the Road Board have sanctioned a grant of £1,000, half the cost of widening Frinks-road, Harwich.

Hollingbourne R.D.C.—The tender of Messrs. Clarkson & Simonds has been accepted for steam rolling, their prices being 2s. 10d. per hour, and scarifying at 3s. per 100 yds. The tender of Messrs. Denniss, Paine & Co. has been accepted for tools, as follows: Brooms, 35s. 6d. per dozen; ash handles, 3s. 6d. per dozen; shovels, 49s. 6d. per dozen; stone forks, 63s. per dozen; picks, 2s. 2d. each; pick handles, 7s. 6d. per dozen.

Plympton R.D.C.—Estimates are to be prepared of the cost of the improvement to the district roads asked for by the military authority in connection with the camps and forts in the neighbourhood, and the council will apply to the Road Board to meet the cost of the works.

Rotherham T.C.—The borough engineer, Mr. E. B. Martin, has received instructions that when the tramway is laid in Cranworth-road wood setts are to be put down between Effingham-square and Howard-street.

St. Ives T.C.—The council have accepted an offer from the Road Board of a grant of £594 and a loan of £1,188, free of interest, and repayable in annual instalments in five years, towards the cost of the proposed Stennack-road improvement, the period of repayment to be extended to seven years, provided the county council would take over the thoroughfare as a main road.

Stoke-on-Trent T.C.—The Road Board have sanctioned a grant of £5,000 towards the cost of improvement of Federation-road, Burslem (estimated to cost £4,682); the conversion of Waterloo-road from North-road, Cobridge, to the new town hall, Burslem, from a macadam road into a sett-paved road (£11,113); Trentham-road (widening and storm sewers, £1,067); and Stone-road diversion at Longton (£2,347).

Watford U.D.C.—High-street and London-road are to be paved with wood, at an estimated cost of £20,575.

Weston-super-Mare U.D.C.—It has been agreed to carry out the proposed street improvement and contingent works in Birnbeck-road, for which plans were prepared by the surveyor, Mr. H. A. Brown.

Wigan T.C.—With the view of providing work for the unemployed the General Purposes Committee have resolved to proceed with proposals for making a road from Whelley to Wigan-lane, and the continuation of the Kenyon-road to Spencer-road. The Local Government Board have been written to inquiring whether the work could be included in the scheme sanctioned by the board for the relief of unemployment.

SEWERAGE AND SEWAGE DISPOSAL.

Barnet R.D.C.—It has been resolved to carry out an enlargement of the contact beds at the sewage disposal works by direct labour, under the supervision of the surveyor, Mr. A. J. Wilshire.

Bath R.D.C.—A letter has been received from the Local Government Board approving generally the council's scheme for the disposal of the sewage of Freshford.

Bexhill T.C.—A scheme has been approved for dealing with the storm-water from the Cooden beach sewer, at an estimated cost of £680.—The scheme of the surveyor, Mr. G. Ball, for lengthening the outfall at Galley Hill has been referred to a special committee for report.

Coatbridge T.C.—The council have approved a scheme of sewage disposal which is estimated to cost £30,000.

Congleton R.D.C.—A scheme of sewage disposal is to be carried out, at an estimated cost of £2,100.

Kidderminster T.C.—Messrs. Willcox & Raikes have prepared plans and estimates for a sewerage and sewage disposal scheme, for which the council are recommended by the Drainage Committee to borrow £31,000.

Norwich T.C.—The council agreed on Tuesday that the main carrier from the sewage tanks at the Whitlingham Farm should be covered in with reinforced concrete slabs, at an estimated cost of £140, and that the necessary work should be put in hand to enable an additional 2½ acres of land adjacent to the main carrier to be irrigated, at an estimated cost of £30. It was also decided to accept the quotation of Messrs. Tangyes to rebore the four liners of the gas engines at Trowse sewage pumping station and fit new plain pistons instead of water-cooled pistons, for the sum of £82 less 2½ per cent, carriage to and fro extra.

Rochford R.D.C.—The council have requested Mr. E. J. Silcock, M.INST.C.E., of Westminster and Leeds, to advise them on the question of the sewerage and sewage disposal of South Benfleet.

Stockport T.C.—The council on Wednesday approved, on the recommendation of the Sewage Outfall Committee, of an agreement for the reception and treatment by the Manchester Corporation of the sewage of the borough up to six times the dry-weather flow. The Stockport Corporation have had under consideration a scheme to extend their sewage works at an estimated cost of £60,000, and to take in the sewage of the Heaton Norris district. It is now estimated that the cost of the extension, in order to deal adequately with the sewage of the whole of the borough, including Heaton Norris, would be close upon £100,000, which is held to be prohibitive; hence the agreement with the Manchester Corporation.

Tavistock R.D.C.—The council have referred two schemes of drainage outfall for Whitchurch to the parish council, and also invited tenders for carrying out drainage works at Lydford.

WATER, GAS, AND ELECTRICITY.

Batley T.C.—Subject to the sanction of the Local Government Board, the council have accepted the tender of the Turnover Filter Company, of Belfast, for the supply, erection, and completion of a water purification plant for the baths. The firm guaranteed that the plant would cleanse both ponds in six hours.

Chapel-en-le-Frith R.D.C.—Messrs. Brady & Partington have prepared a scheme for intercepting the springs on the Nook Farm estate, and pumping the water above the Nook, whence it will flow by gravitation to the mains at Fernilee. The estimated cost of the works is £3,200.

Cheadle R.D.C.—The council have approved a water supply scheme for Warrington, estimated to cost £14,410.

Colwyn Bay U.D.C.—The council have approved the plans of the surveyor, Mr. W. Jones, for a service reservoir which is to be constructed on the top of the high land near Mochdre recently acquired. The land occupied by the reservoir will comprise 7 acres, and the reservoir will have a capacity of 11,000,000 gallons. The value of the land set apart for the reservoir was put at £455, and the rest of the estate, which will be used for a public park, was valued at £205. A loan for these amounts is to be obtained.

Essex C.C.—The council have approved a scheme for sinking a second borehole at Severalls Asylum, and for installing machinery for lifting the water to a tank.

Haddington T.C.—A scheme has been prepared by Mr. Carfrae for the construction of a reservoir for the conservation of part of the water which runs to waste in the catchment areas. It will have a capacity for a three days' supply.

Hastings T.C.—The council have decided to instal six filters at the Filsham pumping station, together with an aerating plant, at a cost of £4,298, and to apply to the Local Government Board for the necessary loan.—It has been agreed to adopt the suggestion of the Local Government Board to defray the cost of laying electric cables on the Brisco estate out of the loan of £5,000 previously sanctioned for prospective expenditure on mains, instead of having another loan of £1,185 for the work.

Keith T.C.—It is proposed to construct a concrete reservoir at Cathie Hill, subject to a loan being obtained for the cost.

Middlesbrough T.C.—The council have agreed to [illegible] the North Ormesby gas undertaking for £26,500.

Perthshire C.C.—In connection with the Stanley special water supply district it was been decided to lay a new 6in. pipe from the Cowford reservoir towards Stanley, alongside the existing pipe at an estimated cost of £1,200.

Selby R.D.C.—A letter was read on Monday from the Local Government Board again calling attention to the remarks of the former medical officer to the council (Dr. Stedman) as to the need of a water supply for the villages of Haddlesey, Carlton, Camblesforth, Drax, and Burn, and inquiring the present position of the proposed scheme. The letter also drew attention to the medical officer's report on the unsatisfactory supply at Wistow. It was stated in the course of the discussion that the pipes would now cost 50 per cent more than before the war. A resolution was carried that the scheme be adjourned till after the war.

MISCELLANEOUS.

Birmingham T.C.—The council on Tuesday adopted a scheme for the construction of new tramways and the purchase of additional rolling stock.

Haywards Heath U.D.C.—The seal of the council has been fixed to the conveyance of the site for the proposed cemetery.

Southport T.C.—The General Purposes Committee have accepted a scheme submitted by the Parks and Foreshore Committee, for the development of the sea front. The estimated cost of the alterations and improvements is about £70,000. The works include the widening of the marine drive, the erection of a wall 5 ft. in height on the inner side of the drive, to enclose to a large extent what is known as the "lagoon site," and the construction of two bowling greens and an open-air concert pitch in the North Marine Park.

Todmorden T.C.—A new motor fire engine purchased by the council was tested lately in the presence of a large company. The engine is of the petrol-driven Merryweather "Hatfield" type, and delivers 450 gallons per minute.

PERSONAL.

Mr. Edward Brearton, Rushall, has been appointed assistant county surveyor by the Queen's County Council.

Mr. C. E. Fox, architect and surveyor, of Halifax, has accepted the appointment of consulting surveyor to the Southowram Urban District Council.

Mr. John Rorke, county surveyor of Queen's County, has resigned, and the county council are advertising for a successor at a salary of £350 a year.

Mr. John Morgan has been appointed temporary surveyor to the Blaenavon Urban District Council during the absence of the surveyor, Mr. E. W. Edwards, on active service.

Mr. W. G. Powell has been appointed first assistant in the city engineer's department, Norwich, at a salary of £175 per annum, and Mr. R. A. Winfield second assistant.

Messrs. W. A. Burn, borough surveyor's office, Taunton, and J. W. Moncur, M.INST.C.E., borough engineer of Sunderland, have been elected members of the Royal Sanitary Institute.

Mr. Charles Herbert, assistant to Mr. G. Riley, surveyor to the Wellington (Salop) Urban District Council, has been appointed assistant in the surveyor's department, East Suffolk County Council.

Mr. E. A. Aston, who has been acting as honorary secretary of the Dublin Mansion House Committee of the National Relief Fund, has been appointed an inspector of the Local Government Board for Ireland.

Mr. H. M. Bennett, sanitary surveyor to the Warmley Rural District Council, has been appointed a representative of the council to attend the conference in Bristol on National Housing and Town Planning.

Mr. Vincent J. Willis, assistant surveyor to the Morecambe Corporation, was on Friday last appointed assistant engineer in the borough engineer's department of Halifax. He served his articles to Mr. J. W. Hipwood, ASSOC.M.INST.C.E., borough surveyor of Morecambe, and was subsequently appointed assistant surveyor by the council, which position he has held for the past three years.

Mr. Henry Wood, ASSOC.M.INST.C.E., M.R.SAN.I., associate member of the Institution of Municipal and County Engineers, was at Tuesday's meeting of the Norwich City Council appointed deputy city engineer in succession to Mr. Harold Collins, ASSOC.M.INST.C.E., the recently appointed borough engineer and surveyor of Colchester. Mr. Wood was articled to Mr. A. H. Mountain, M.INST.C.E., civil engineer, Manchester. He was subsequently appointed assistant engineer to the Heaton Norris Urban District Council, and afterwards held a similar position under the Swinton and Pendlebury Urban District Council. Mr. Wood became an assistant in the office of the city engineer of Norwich in 1903, and since that time has held the positions of courts and yards surveyor, general assistant, and chief assistant.

Town Planning at Ruislip-Northwood.—A town planning inquiry was held recently at the Ruislip-Northwood Urban District Council offices by Mr. G. L. Pepler, F.S.I., Local Government Board inspector, as to the second scheme of town planning for this council. The inquiry was well attended, and the necessary evidence in support of the scheme was given by Mr. W. Louis Carr, surveyor to the council. The second scheme comprises a number of detached areas, about 600 acres in all, and includes parts of two rural districts.

Unemployment and Road Schemes.—It was reported at the meeting of the Essex County Council recently that the Road Board had undertaken that if approved schemes of road improvement were put in hand in consequence of an intimation from the Local Government Board that relief works were required in particular districts on account of unemployment caused by the war, the Road Board would provide the whole of the money for the carrying out of these. It was mentioned that the county surveyor had prepared road schemes involving an estimated expenditure of £22,300, one of these being the widening of the Epping New road.

FOR OTHER ADVERTISEMENTS

See End of Paper.

ATHERSTONE RURAL DISTRICT COUNCIL.

SURVEYOR'S DEPARTMENT.

Applications are invited for the position of Assistant to the Engineer and Surveyor. Salary at the rate of £100 per annum. Applications, with copies of not more than three recent testimonials, to be sent to me on or before Monday, 2nd November, 1914.

Conditions and Specification may be seen, and Forms of Tender and Bills of Quantities obtained, on and after Friday, the 30th instant, upon application to the Borough Engineer, Mr. J. Patten Barber, at the Town Hall, Upper-street, N., on payment of Two Guineas, which will be returned on receipt of a *bonâ-fide* Tender and the return of the whole of the documents issued.

Sealed Tenders, endorsed "Tender for Paving Works," must be received by the undersigned not later than 4 p.m. on Tuesday, the 10th November, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

C. G. E. FLETCHER,
Town Clerk.

Town Hall, Upper-street, N.
October, 1914. (2,035)

SURVEYORS' INSTITUTION.

ARRANGEMENTS FOR FORTHCOMING SESSION.

The session of the Surveyors' Institution will open on November 9th, when the president, Mr. Howard Chatfield Clarke, will give his presidential address. The gold medal award by the council in respect of the best paper read during the previous session will be presented to Prof. W. G. Fearnsides on the subject of his paper on "The Part Played by Water in Mountain Road Construction."*

Ordinary general meetings will be held on November 23rd, December 14th, January 11th and 25th, February 9th and 22nd, March 8th, April 12th and 26th, and May 10th.

On November 23rd Mr. Edwin Sawer will read a paper on "The Home-grown Wheat Supply Available in War Times." The remainder of the session will be taken up in discussing the acquisition of land for public purposes, introduced by Mr. Andrew Young and Mr. L. O. Mathews; land tenure, introduced by Mr. Joshua Bury and Mr. J. G. Head; rating, introduced by Mr. Isaac Dickson and Mr. E. H. N. Ryde; and housing, introduced by Mr. Strachan Gardiner and another.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

EASTERN AND NORTH-EASTERN DISTRICTS.

An Eastern and North-Eastern District meeting will be held at Dunstable on Saturday, October 31st.

PROGRAMME.

11.45 a.m.—Meet at Guildhall. Short business meeting.

12.45 p.m.—Luncheon, at moderate charge.

1.30 p.m.—Leave for water tower, inspecting en route objects of antiquarian interest, including the old Roman city and the cathedral. Mr. T. Francis Hewitt (member), of the city engineer's department, will afford the members information on these.

2.45 p.m.—Leave water tower, when visitors will divide into two parties, one party visiting the gas and electricity works and tramway undertakings, and [illegible] en route, the other visiting the Bracebridge reservoir and the sewage disposal works.

4.45 p.m.—Tea.

The city engineer and surveyor, Mr. R. A. MacBrair, M.INST.C.E., the electrical engineer, Mr. Stanley Clegg, M.I.E.E., the waterworks engineer, Mr. Horobin, and the gasworks engineer, Mr. John Carter, have kindly granted all facilities for visiting the various undertakings, and will, if possible, conduct the parties round or arrange for their deputies to do so.

G. BELSON CHILVERS,
Hon. District Secretary
Offices.

Meetings will be held at Newcastle on Saturday, November 7th, and December 12th.

B. WYANE,
39 Victoria-street, S.W. *Secretary*

Disinfecting Apparatus.—A correspondent asks for the names of makers of disinfecting apparatus. Address A., care The Editor.

The London and Lancashire Fire Insurance Company, Limited, announce that, as from Monday last, their London office address will be 155 Leadenhall-street, E.C. Their old premises in King William-street have long since been outgrown, and the continuous increase in the number of the clerks required to deal with the company's steadily expanding business has necessitated a portion of the staff being housed in various temporary offices in other parts of the City. The inconvenience of this arrangement made it imperative to seek new quarters, and the handsome building now approaching completion in Leadenhall-street is the result.

* This paper, together with a full report of the discussion which followed its reading, appeared in THE SURVEYOR of November 28 and December 19, 1913.

SHEFFIELD CITY ENGINEER'S DEPARTMENT.

The appointment of Mr. W. J. Hotchkiss, surveyor of highways and deputy city surveyor, as city surveyor of Sheffield is, we are given to understand, a permanent and not a temporary one, as we were led to believe last week. A passage in the report of the Special Committee dealing with the rearrangement of the city engineer's department stated that "officers of the corporation whose responsibilities are increased by the above arrangements are to be informed that their new appointments are temporary only," but this condition was evidently not intended to apply to Mr. Hotchkiss.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

SOUTH MIMMS.—For the erection of twelve workmen's cottages at South Mimms, for the rural district council.—Mr. G. Skipper, surveyor :—

J. J. Bascan, St. Albans	£3,198
S. Worboys, Potters Bar	2,940
Willmott & Sons, Ruislip	2,880
Payne Brothers, Neavesden	2,793
Pilgrim & Sons, Wilstone	2,760
W. Eaton, Bushey Wood	2,748
Williams & Sons, Potters Bar	2,640
W. Slough, Barnet	2,630
W. Simmons, Wood Green *	2,520

WALTHAMSTOW.—For the erection of boundary wall and iron fencing around the Billet-road site, for the Education Committee.—Mr. H. Prosser, architect :—

W. J. Shelton, Canning Town	£1,379
Wood & Lee, Walthamstow	1,375
F. J. Coxhead, Leytonstone	1,333
A. G. Tarrant, Walthamstow	1,317
J. S. Hammond, Sons, & Co., Romford	1,296
T. B. Lever & Son, Upper Holloway	1,295
J. Sands, Walthamstow	1,216
J. & J. Dean, Walthamstow *	998

WEST LANCASHIRE.—Accepted for sewerage extensions, for the rural district council.—Mr. J. Wignall, surveyor :—
J. Whittle, Ormskirk, Lancs. First scheme, £512. second scheme, £348.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

OCTOBER.

29. Institution of Electrical Engineers. Sir John Snell, president, delivers his inaugural address. 8 p.m.
31.—Institution of Municipal Engineers: Eastern and North-Eastern District Meeting at Lincoln.

NOVEMBER.

2.—Royal Institute of British Architects: Ordinary General Meeting. 8 p.m.
9.—Surveyors' Institution: Mr. H. Chatfeild Clarke, president, delivers his opening address. 8 p.m.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

COUNTY COUNCIL OF THE WEST RIDING OF YORKSHIRE.

The West Riding Highways Committee invite applications for the post of Assistant Surveyor in the office of the West Riding Surveyor.

Applicants must have had good practical experience in road construction, particularly in respect of the use of tar-macadam, tar-grouting, foundation work, road widenings, &c. A sound knowledge of surveying and [illegible] also necessary, and, in addition, applicants must be neat and accurate draughtsmen.

Salary, £150 per annum.

The successful candidate will be required to devote the whole of his time to the duties of the office.

Applications (on form to be obtained from the undersigned), accompanied by not more than three recent testimonials, to be delivered at the office of the West Riding Surveyor not later than 10 a.m. on Monday, the 2nd of November, 1914.

Canvassing will disqualify.

F. G. CARPENTER,
West Riding Surveyor.

County Hall,
Wakefield.
October [illegible] 1914. (2,017)

COUNTY BOROUGH OF DEWSBURY.

SEWAGE DISPOSAL WORKS.

WORKS MANAGER.

The Sewage Disposal Committee of the Corporation invite applications from persons who have had large practical experience in the actual Construction of Sewage Disposal Works for the position of Manager of the Works to carry out by direct labour the Construction of Sewage Disposal Works at Mitchell Laithes, Dewsbury. Whole time must be given. Staff found by Corporation. Salary at the rate of £400 per annum. Applications, endorsed "Works Manager," stating age, qualifications, and experience in Sewage Disposal Works Construction, with copies of three recent testimonials, to be sent in to the undersigned on or before the 10th of November next.

No one who has not had large experience as Constructural Works Manager of Sewage Disposal Works need apply.

H. ELLIS,
Town Clerk.

Town Hall, Dewsbury.
October 10, 1914. (1,988)

RHYMNEY VALLEY SEWERAGE BOARD.

RHYMNEY VALLEY SEWERAGE CONTRACTS.

The Rhymney Valley Sewerage Board invite applications for the appointments of Inspectors in connection with the above Contracts, which comprise a Main Sewer, Storage Tanks (partly of Reinforced Concrete), Cast-iron Discharge Mains and Works on the foreshore of the Bristol Channel.

Salary from £2 10s. to £3 per week, according to qualifications.

Previous experience in the superintendence of work of a similar nature is essential, and full particulars of such experience, together with copies of recent testimonials, must be forwarded by the candidates with their applications, in envelopes endorsed "Rhymney Valley Sewerage, Inspectors," and addressed either to Messrs. Chatterton & Alford, 9 Victoria-street, Westminster; or to Messrs. Willcox & Raikes, MM.INST.C.E., 63 Temple-row, Birmingham, not later than October 31st, 1914.

T. J. THOMAS,
Clerk to the Board.

36 High-street,
Barmouth, Glam.
October 9, 1914. (1,996)

RURAL DISTRICT COUNCIL OF CHELMSFORD.

ASSISTANT ENGINEER AND SURVEYOR.

The Council require the services of an Assistant in the Office of their Engineer and Surveyor.. Applicants must have had previous experience in Engineering and Surveying, including Water Engineering, and be capable of preparing drawings, taking levels, and inspecting buildings in course of erection.

Salary (to include travelling expenses) commencing at £80 per annum, rising by annual increments of £10 (subject to satisfactory service) to £120 per annum.

Applications, stating age and previous experience, and accompanied by copies of three recent testimonials (which will not be returned), to be sent to the undersigned not later than the 3rd November, 1914.

(By order)
ARTHUR S. DUFFIELD,
Clerk.

96 High-street, Chelmsford. (2,022)

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. OCTOBER 30, 1914. No. 1,189.

Minutes of Proceedings.

Irish County Surveyors and their Salaries.

We have already called attention to the inadequate remuneration of county surveyors in Ireland, and the obstinacy of county councils in insisting upon treating their officials with scant consideration. Reform in this matter is, it would seem, difficult of attainment, for it is only recently that the Waterford County Council have seen fit to place themselves in line with too many other authorities who pay their county surveyors salaries that are notoriously insufficient. Mr. W. E. L'Estrange Duffin, M.INST.C.E., the county surveyor, who has to his credit a long period of faithful and efficient service, resigned, and the Waterford County Council duly advertised for a successor. They proposed that the initial salary should be £350 a year, with a grant of £100 towards the purchase of a motor car. This grant is to cover all travelling expenses, and no increase of salary is to be allowed until after the lapse of a period of five years. These terms have been very properly criticised by the Local Government Board for Ireland as completely unsatisfactory. In a letter to the county council the board state: "The board are of opinion that the sum of £100 would not provide a good car, and that the cost of maintenance of it would be considerable, as the efficient performance of the duties of a county surveyor necessitates frequent travelling over the whole county. In the circumstances the board would suggest that the county council should again consider the terms of remuneration to be attached to the office, with a view of fixing a more liberal scale of salary, annual increments, and a larger allowance towards the cost and maintenance of a motor car and other travelling expenses." This rebuke was thoroughly well deserved, and it is to be trusted it will be received and acted upon in the proper spirit by the members of the Waterford County Council.

But we regret to confess we are not very confident of such an issue, especially if we are to judge by the parsimonious spirit evoked at a recent meeting of the Queen's County Council under conditions almost identical with those of the Waterford County Council. The county surveyor, Mr. John Rorke, had resigned, and the question of filling the vacancy, and the salary to be offered, came up for consideration. A proposal was made that the amount be £350 a year, and against this Mr. McEvoy protested. "You have already," he said, "lost one good man, and you are losing another now. Why not advance the salary and try to keep a good man if you can get him." And he proposed that the salary be increased by £100. In the subsequent discussion Mr. Maher distinguished himself as a shining light of economy by declaring that "he was sorry to see any person going for a rise. His idea would be to reduce the salary; £300 would be a good enough salary, even though the surveyors went away, and there ought to be plenty of good men to be got." The councillor's method of getting good men is, it will be noticed, a distinctly original one, and obviously he is not tormented by any fears as to how it will work in practice. However, it is sufficient to say that in the end the council fixed the salary at £350, and thus justified their reputation as false economists. Instances like these would almost make us despair if we did not feel that the repeated exposure of such scandals, backed by the official authority, ought eventually to have some effect upon county councils. If it does not, then there will be nothing for it but to deprive these bodies of the power of sweating their high officials, and insist that an adequate scale of salaries shall be fixed by the Local Government Board.

Practical Training of Engineers.

The report of the Special Committee on the Practical Training of Engineers has now been issued by the Institution of Civil Engineers, and it is somewhat to be regretted that this particular moment—when most men's minds are diverted into other channels—was chosen to make it public. The report is full of interest on the general question of the necessary education of the young engineer, but the portion of the report dealing with the training of the municipal engineer is naturally that which is of special interest to our readers. So long ago as March, 1913, the committee, consisting of Dr. Unwin, in the chair, and Sir Maurice Fitzmaurice, Mr. John A. Brodie, and Mr. S. S. Platt, considered this question, and it is very interesting to see that there was some considerable difference of opinion as to the merit [illegible] university course before becoming an engineer's pupil. The question of time and expense which is thus involved becomes a serious obstacle to such a course, and the difficulty of combining pupilage with attendance at evening technical classes is insuperable where there is no such training within reach, and is also a considerable tax on a young man's mental and physical strength. The question of municipalities objecting to their surveyor taking premium pupils was discussed, as was also the absurdity of some corporations expecting their surveyors to take pupils for a premium which was to be paid in to the borough or district funds. It was agreed on all sides that it would be of national benefit if properly qualified and able surveyors were allowed to take a reasonable number of premium pupils. As one of the committee remarked, "A pupil will not get much attention from the engineer if he does not get a premium," and this

[illegible] of course, a valid fact. Why should he? The method adopted for training the pupil in an engineer's office was also referred to, and substantially it came to this: (1) First to the drawing office to become a good draughtsman; (2) then practical experience out of doors with the level and theodolite; (3) then on to any works under construction—such as sewers, road making, tramways, bridges, and so forth, acting as a sort of assistant clerk of works; (4) then back to the drawing office to design works, prepare specifications, bills of quantities, etc., and then on to the job to see it through from beginning to end; (5) in a large office he should then be transferred for mechanical work to the tramways department, the water department, refuse destructor department, and so on. As, of course, some pupils would not always be very promising, a good suggestion was made that a pupil should be taken on probation, for, say, three months, and if approved then allowed to start his articles from the date of the beginning of his probation. These and many other subjects were most usefully discussed. The committee then came to the conclusions which we print on another page. We very heartily congratulate the institution and the committee on the result of their labours.

* * *

The Modern Municipal Engineer.

We have already noticed in these columns the appointment of Mr. E. R. Matthews, ASSOC.M.INST.C.E., as Chadwick Professor of Municipal Engineering in the University of London—an appointment which signalises the opening of entirely new opportunities of training for the younger members of the profession. Prof. Matthews has now taken up his duties at University College, and is inaugurating the work of the new department by the delivery of three public lectures—admission to which is gratuitous—dealing with important aspects of municipal engineering work. In our last issue we were enabled to reproduce for the benefit of our readers the initial portion of the first of these lectures, which deals with "The Functions of a Municipal Engineer." The remainder of this lecture will be found elsewhere in the present issue, and we are confident that the whole will be read with great interest and appreciation. At the outset Prof. Matthews pointed to the enormous amount of outstanding loans borrowed by local authorities for the execution of public works as demonstrating the growing importance of the profession of municipal engineering, and as justifying the new departure in university engineering education, of which he is the head. With a higher standard of training, however, the demand for adequate remuneration and security of tenure will become more insistent, and it is well constantly to bear in mind that these questions of efficiency and Government protection are in a large measure independent.

While fully recognising the almost infinite variety of the duties which may devolve upon the municipal engineer, Prof. Matthews instanced six principal matters with which his department is concerned—namely, water supply, sewerage and sewage disposal, road construction and maintenance, tramways, the collection and disposal of house refuse, and street lighting. Although some difference of opinion is bound to exist as to the relative importance of these and other services, we are inclined to agree with this list as being fairly representative of the work of an up-to-date municipal engineer's office, except that we should have included housing and town planning, or substituted it for street lighting, which is at present at a discount—at any rate in London! Of the specific topics dealt with in the lecture under notice, perhaps the discussion regarding assistance to the War Office is of the greatest current interest. One proposal, which we confess is new to us, although the Bridlington Corporation appears to have obtained powers as long ago as 1904, is that local authorities should, even in time of peace, purchase land for the purpose of allowing it to be used as a military or volunteer encampment or manœuvring ground. We are sure that Prof. Matthews' many friends will unite in wishing him every success in his new work.

Extraordinary Traffic: Who is Liable? II.

In our comments of last week on the question of the liability for extraordinary traffic we briefly referred to the decision in *Egham Rural District Council* v. *Gordon*, in which traffic conducted by a brick company in delivering bricks was held not to have been conducted "in consequence of" the order of the purchaser. It may be remembered that in that case Mr. Justice Darling regarded the words "in consequence of" as equivalent to "as a *necessary* consequence of." Fortunately, as it appears to us, this view was afterwards modified, and can no longer be regarded as correct. Five years after the Egham case the case of *Reigate Rural District* v. *Sutton District Water Company* (71 J.P., 405) came before the Divisional Court on appeal from a county court. In that case the company employed a contractor to supply materials for the construction of a reservoir. As in the Egham case, the mode of delivery was left entirely to the contractor, who made use of traction engines—although there was evidence that it would have been feasible to convey the materials in ordinary carts. As in the previous case, the County Court Judge held that the company were not liable; but the Divisional Court reversed his decision. Mr. Justice Darling revised his dictum in the earlier case, and said: "'In consequence of' means as a *natural* consequence of the order which was given; neither the inevitable consequence nor the necessary consequence of that order." And Mr. Justice Lawrence thought the onus was upon the company to show that the method of delivery adopted was not the natural method which they would have contemplated when they gave the order.

These views were approved by the Court of Appeal in *Bromley Rural District Council* v. *Croydon Corporation* (1908, 1 K.B., 353), in which the corporation were held liable for traffic conducted by two contractors whom they employed to deliver stone for road construction and repair—traction engines being used for the purpose. Lord Justice Kennedy, indeed, was inclined to extend the meaning of the term "consequence" still further, and to regard it as equivalent to "something which would not have happened but for the contract." This, however, was an *obiter dictum*, not necessary for the decision of the case, and it is perhaps open to doubt whether, in the event of a contractor resorting to an unusual method of carriage, or an unusual route, the employer would not escape liability. But it would appear that the Egham case can no longer be regarded as a precedent, and that, as a general rule, the employer of a contractor will, in the absence of exceptional and unforeseen circumstances, be liable for extraordinary traffic conducted by the latter.

Brodie on Boulevards.

We reproduce elsewhere a paper on "Wide Roads for Cities," which Mr. John A. Brodie, M.INST.C.E., the city engineer of Liverpool, read at a meeting of the Town Planning Institute last Friday. Mr. Brodie is an acknowledged expert in town planning matters, and it will be recollected that he was one of those whose advice was sought by the Government in the important question of the planning of the new City of Delhi. Therefore, as might have been expected, his paper was of a very high standard of excellence. Mr. Brodie claimed that wide roads were essential, not only for purposes of traffic, but also as air spaces,

playgrounds, beauty spots and places for healthy exercise. He pointed out that, up to the present, roads had not been made wide enough, and he instanced a case in Liverpool where a road had been twice widened and then had to be widened still further after only fifteen years had elapsed. This want of foresight had, of course, been very costly. Various points were taken up in the discussion that followed, some of these may be enumerated as follows: Has not a straight, wide road "a terrible sense of vacancy"? Should not the width of the carriageway be plotted to meet the exigencies of the traffic and the total width of the road be discriminated from that of the actual carriageway? Was not the presence of tramways detrimental to the appearance of a wide road unless concealed by trees or shrubs? Were not the wide streets and roads in Germany mainly responsible for the very high house rents? Was it not a pity to use so many acres of land per mile per road when the ground could be otherwise more usefully employed? Was not the cleansing and maintenance of broad roads a heavy burden on the ratepayers? Are forecourts or set-backs not likely to be the reverse of picturesque unless kept in proper order? These and many other points undoubtedly beset the question of wide roads, and it is undeniable that considerable discrimination is necessary as to where such thoroughfares should be constructed. It is evident that the proper person to design a town planning scheme is the municipal surveyor or engineer, who alone understands and is prepared to meet just such difficulties as these.

* * *

Municipal Engineering in Canada.

In a recent issue of the *Contract Record* of Toronto there appears an article on "Recent Developments in the Field of Municipal Engineering," by Mr. F. W. W. Doane, the city engineer of Halifax, N.S., which affords a very interesting comparison as regards civic progress in Canada and the Mother Country. In the first place, the Canadian municipal engineer must be endowed with the same diversity of gifts as is demanded of his British cousin, for Mr. Doane recalls that it has been said that a city engineer should have the wisdom of Solomon, the patience of Job, the executive ability of Napoleon, the diplomacy of Talleyrand, and the temper of an angel—conditions which, he points out, have been implied in recent advertisements. As regards recent developments in Canadian practice, the main questions which have arisen for solution bear a striking resemblance to those which confront us at home. For example, strong and persistent efforts are being made to discover a cheap form of pavement or roadway construction which will enable the municipality of moderate means to maintain its roads in fair condition under the destructive influence of motor traffic. Purification in water supply, sewage disposal and sludge treatment, and improved methods of street cleaning are other matters to which special attention has been given of late in the Dominion. Town planning, too, is on the increase, and Mr. Doane places on record the fact that the city of Halifax obtained the first town planning legislation passed in Canada, having been protecting residential property and carrying on other similar improvements since 1896. It will thus be seen that the problems of the Mother Country are the problems of Canada—with this difference, however, that the latter, being a comparatively young country, can profit by the mistakes and experiences of the past.

* * *

Sewage Treatment at Sheffield.

The recently issued annual report of the city engineer of Sheffield, Mr. Charles F. Wike, is worthy of more than a mere passing allusion, especially with regard to the information and statistics dealing with the sewage disposal works which it contains. It is interesting to learn that very nearly 20,000,000 gallons of sewage per day has received treatment in tanks and contact beds, or on land. The total flow for the last three years has averaged 43 gallons per head per diem of the population—which is a large amount. The average amount of sludge produced at the works has been 7·73 tons per 1,000,000 gallons of sewage treated. About 62,000 tons of sludge had to be dealt with during the year covered by the report, and only 288 tons of this were taken by farmers, the remainder being apparently tipped on about 32 acres of land specially reserved for the purpose. Mr. Wike calls attention to the large increase of trade wastes in the sewage, and especially to the presence of petrol, which, as he points out, is "not only objectionable from a purification point of view, but obviously may prove highly dangerous if the vapour emitted should become confined in the sewers at any point."

The methods adopted for the purification of the sewage appear to be working very satisfactorily, as the numerous diagrams and tables clearly indicate, and it is of special interest to observe that Mr. Wike notes in one part of his report that—"The effluents obtained have been exceedingly good for primary beds, and any secondary treatment needed will only be such as to remove the colloidal and suspended matters which at times remain." This might be expected, as these colloidal and suspended matters in sewage effluents are often a great source of trouble to all sewage works managers. There is another matter in connection with this report that is worthy of notice, and that is the amount of purification effected by tank and land treatment of a portion of the sewage, which shows an amount of purification almost equal to that effected by tank and double contact treatment. Mr. Wike's report is a valuable addition to the existing literature on sewage disposal.

* * *

A Possible Danger.

The heavy siege guns of the German Army, which were used with such deadly effect before Antwerp, are limited in their uses owing to the fact that they must be set upon substantial concrete foundations. There is a considerable body of evidence to show that, as regards the battlefields of France and Belgium, these necessary concrete beds had been prepared in time of peace under the guise of foundations for hotels and chateaux; and the question is being widely asked whether the emissaries of the enemy may not have been engaged in similar work in this country. The matter is one which common prudence demands should be investigated rigorously and systematically, and it would appear that very valuable assistance can be rendered to the military or police authorities by the records of building plans and building inspection which should be in the archives of the London County Council and the district surveyors in the Metropolis, and the local authorities responsible for building inspection in other places. A few days ago a sensational story was spread that a concrete roof, between 3 ft. and 4 ft. thick, had been discovered on a building at Willesden which was in the occupation of a German firm, and situated so as to command several important lines of railway. It subsequently transpired, however, that the alleged thickness of the roof had been grossly exaggerated, and that the principal importance of the "discovery" lay merely in its proof of the fact that the authorities are alive to the possibilities of danger. In matters of this kind anything in the nature of panic is both useless and foolish. The work of investigation must be steadily pursued, without hesitation and without fluster, and we feel sure that in its prosecution any assistance which municipal engineers can render will be readily forthcoming.

Some Notes on the Development of Wide Roads for Cities.*

By JOHN ALEXANDER BRODIE, M.Inst.C.E., M.I.Mech.E., M.Eng.(Liverpool), City Engineer of Liverpool.

The question of town planning which deals with the question of wide roads has received a great deal of attention and has been very widely discussed during recent years, but there is still room for differences of opinion both on matters of principle and of detail.

We are all, I think, however, agreed in a general way that some wide roads are an advantage, and are, in fact, required in connection with even the smaller populations, and that they are still more necessary in the larger cities; but when we come to settling the width of any particular road we find that great differences of opinion arise, and that there is a general tendency on the part of a large number to continue in the good old English way and to muddle through on the lines of cheap first cost, without looking ahead and without making satisfactory provision for the probable future requirements—leaving, in fact, the future to take care of itself.

As one who has for a period of thirty years studied and been connected with the design, construction and maintenance of roads, tramways and means of communication generally in large towns, it has been my lot to spend very large sums of money in road improvements, most of which expenditure could easily have been avoided by foresight if combined with better powers of control over the laying out of new areas. Liverpool has spent on works of this description over £5,000,000 during the last fifty years, which works out at an average of about £100,000 per annum; and to-day, notwithstanding our enormously increased added areas, this average is hardly being maintained.

Many of the other great cities have also spent immense sums in such improvements; but, notwithstanding this, it can truly be said that no city in this country is well provided in regard to arterial roads.

LONDON.

The great City of London is in this respect without doubt the greatest sinner in this country, and I am not aware that there is as yet a single great trunk road worthy of the name through the built-up area by which we can leave for any part of the country.

Considerable attention has recently been given to this important matter, and it is to be hoped that any works of this description which are put in hand will be carried out on a sufficiently generous scale to meet the future needs of the great Metropolis. It is very important that the largest possible view should be taken when dealing with arterial roads leading out of London. Present conditions are not, however, very favourable for heroic schemes, and it is a little difficult to see where the funds are to come from. In my opinion, £500,000 to £1,000,000 per annum could be usefully and economically expended on this work for many years in the London district alone.

As some of my friends state that I am desirous of having all roads very wide, I think it well to say that my ideal is rather suitably to apportion the width to meet the probable requirements, and that, just as in a system of watercourses we must have the smaller streams and brooks as well as the larger rivers, we must in all systems of streets bear in mind the requirements and conditions which have to be met. If a sufficient number of wide roads are provided to meet the requirements of through communication, a much freer hand can be given in regard to those subsidiary roads where width at any rate of road surface is not of real importance.

While the spending of public money on wide road improvements is always open to criticism, we have probably reached the point where public authorities, as apart from the individual, are satisfied that money spent in advance judiciously has been warranted by results, and we find it no longer so difficult to get the necessary money for important schemes of road widening and improvement.

Cross-section of 60-ft. Road (Edge-lane Drive, Liverpool) Widened to 120 ft.
(Tramway tracks laid in grass.)

In some cases we are even being offered more in the way of widened roads than can reasonably be considered necessary for the requirements of the district concerned. In one case, after arranging for one through road 84 ft. wide, we were approached to see whether we would contribute towards the cost of constructing two roads parallel to the original one, and immediately adjoining, each 60 ft. wide. Though no contribution could be made, the developer decided that he would still make the road 60 ft. wide at his own expense, though the property was only of the cottage type, with a rental of less than 9s. per week, and he has seen no reason to regret his decision. These roads are being quickly developed and built to, whereas other streets at no great distance away, laid out as by-law streets to 36 ft., are being built to at a much slower rate.

Generally speaking, our experience of the construction of wide roads is that it leads to the building of a larger number of better-class houses, and this, again, reacts in the direction of the general improvement of the neighbourhood.

PLEASURE WALKS.

In dealing with wide roads it is very necessary to consider the various purposes which roads are intended to serve, and it will, I think, be found generally that we are too much inclined to consider roads

* Paper read at a meeting of the Town Planning Institute held in London on Friday last.

from some one particular point of view, such as traffic as against the human aspect of the subject, which, after all, must be the position taken up by the public when asking for intended to start the work.

The question of convenience and utilisation as a recreation or exercise ground by the population living on either side of the road is, I venture to think, one of great importance, and one which is apt to be overlooked by those responsible for the purse-strings when expenditures on wide arteries are under consideration.

This side of the question is one which is, I think, not much considered in this country, but it needs to be faced and developed if we are to rear children and young people healthily in, at any rate, those cities where the average rate of income is low, while opportunities for walking exercise on the part of the grown-ups under conditions which will interest them is of almost equal importance.

Recent events have shown that physically strong men will continue to be recruited from the towns as well as from the country districts; and I venture to think that one of the outcomes of our present troubles will be that greater attention will be paid, especially in towns, to all matters which are likely to lead forward in the direction of assisting people to make and keep themselves fit and vigorous.

I have in my mind a road constructed thirty-five years ago to a width of 126 ft. between fences and 190 ft. between the fronts of houses, and having a length of over ½ mile, which is used to an enormous extent as a public walk at all times of the day, but especially in the evenings and on Sundays and holidays; while the central walk, which is lined with trees on each side and provided with seats, is more used in proportion to its area by the children of the neighbourhood than the public parks to which it forms the main approach, though the latter have greater attractions in the matter of ornamental ponds with wildfowl, pleasure gardens with flowers and beautiful trees, which, being at a greater average distance from their homes, cannot be so conveniently reached.

After careful observation, I know of no expenditure of public money in Liverpool which has, on the whole, given greater pleasure and has been more profitably enjoyed, and in my view every important residential district should have such a "lung," and particularly those in which the tendency to overcrowd is greatest. Its use for these purposes in no way interferes with or reduces its effectiveness as a section of a main arterial road leading radially out from the centre to the outlying districts beyond, and a word or two as to the general tendency of traffic on it may be of interest.

This road is laid out with a central boulevard or gravel walk 50 ft. wide, having on one side of it a stone sett-paved street with a double line of tramways, and on the other a pitch-macadam carriageway, together with the usual footwalks. The traffic on both roads, though fairly light in character, is considerable, amounting to some 150,000 tons per yard in width per annum on each carriageway, or a total tonnage of 27,00,000 per annum, exclusive of tramway vehicles, and appears to be about equally divided between the sett paved and macadam road.

Motor traffic is now very considerable, and shows a tendency to prefer in each case the side of the road nearest the central walk, which is only broken by one vehicular crossing near the centre of its length, and it is quite noticeable that experienced motorists avoid the outer sides of the roadways which are intersected by entrances from the side streets, though these outsides would be the natural line for this traffic if the whole road was taken as one carriageway.

Though Liverpool has for many years had the experience and the good example of the wide road already referred to, and many other older streets of good average width, it had before the days of electric tramways settled down to a sort of standard width of about 60 ft. for its main approaches, both within its own area and in the adjoining districts which were still under the control of small local authorities. On the introduction of the faster travel by electric tramways, necessity arose for wider streets, and 60 ft. became the minimum standard. Since that time widths have continued to be increased, the 60 ft. has been increased to 80 ft. as a minimum standard through built-up areas, while 100 ft., and more recently 120 ft., may now be taken as the standard for the most important arteries when passing through areas not closely built upon.

Prince's Avenue, Liverpool. 124 ft. Wide.

A Prophecy.

I venture to think that before long 120 ft. will be considered a minimum for a very limited number of the main arterial roads leading into great cities wherever such roads can be provided at a reasonable cost when compared with the cost of alternative methods of providing fast services on special lines, my view being that money spent on wide roads is a real advantage to the congested communities living in their neighbourhood.

As evidence of the desire for wider roads, as the results of actual experience I may say that I am at the present time negotiating for the widening to 120 ft. of one road which has already been widened to 60 ft. A portion of Queen's Drive, also constructed to 84 ft., is now being widened to 120 ft., and I have also negotiated for and completed the purchase of all land necessary for widening a radial road to 120 ft. for a length of over 2 miles, a portion of which is for the present entirely outside the city area.

A considerable length of this latter 120 ft. wide road has already been completed, the tramway lines being laid in grass in the middle of the road, and the track fenced off from the other traffic by low privet hedges. A speed of 20 miles per hour has been approved by the Board of Trade for the tramways which are now running, and this speed will no doubt

the electric train service, which gives a speed exceeding 20 miles per hour on the average.

I therefore look forward to an improved and

have width of roadway, without which, in my opinion,

utilitarian lines much in advance of anything in the way of building and architectural development, though I certainly agree that in the central areas of large cities the architect should be given as free a hand as is possible, but even in such positions utility must carry as much weight as appearance.

OPEN SPACES.

One very important point which should carefully be borne in mind by town planners is that really wide roads can be made to help considerably in the question of the number of houses to the gross acre, and this particularly when dealing with areas where the houses are of a small type in which in many parts of the large cities it is exceedingly difficult to keep open spaces such as gardens, &c., in tidy condition, and where it is found as a matter of practice that it is better to maintain much of the open areas at the expense of the rates. This has been our experience in Liverpool in the poorer districts, and in addition to wider roads, many areas of an acre and upwards have recently been laid out and maintained at the cost of the public, these in many cases containing playgrounds for children laid up with

Menlove-avenue, Liverpool. 111ft. Wide.

The roads which are of most importance are, of course, the radial roads, but these have a tendency to drive traffic through the central areas which are most congested, and as much traffic can be diverted by means of cross roads, or in the outskirts ring roads, we have also found it necessary to provide through routes for this class of traffic, which, in the case of Liverpool, enables traffic coming in by way of the main roads from Lancashire to distribute itself clear of the congested central area, and our ring road has already been found very valuable from this point of view.

A considerable motor traffic is also arising between the desirable residential areas which lie mostly to the south of the centre and the northern portion of the docks which lie in the neighbourhood of Bootle.

Motorists are quick to recognise that a wide road, even if apparently roundabout, saves much time as compared with narrow roads, especially if congested with traffic.

Another important point is that of appearance, and as I do not pose as one having a trained eye for beauty I propose to leave that section of the subject to those who are better qualified, especially as architectural friends appear to think that no engineer should presume to have ideas on such an essential of beauty as proportion in design.

I venture to think, however, that, whether it is right or not, and whether we like it or not, most of the great arteries on the outskirts of larger cities will be dealt with by engineers, and that, on the whole, arrangements for the playing of the usual children's games.

I think it is well worth consideration on the part of those responsible for the designs of wide roads, and especially those intended as cross town routes or ring roads, that they should as far as possible connect up open-air spaces, and in Liverpool on our ring roads we are attempting to acquire and retain several spaces and tree-planted areas, which are intended to be in the nature of embayments off the road, and which will no doubt be dealt with ultimately as beauty and recreation areas likely to add additional interest, and thus give pleasure to those who use these roads for purposes other than that of through traffic.

With regard to the design of main arterial roads, I much prefer those arrangements of surface in which the speedy lines of traffic are kept as near the centre of the road as possible, leaving the slower traffic to follow the line near the footways. In this way the noise and inconvenience caused by fast traffic is removed as far as possible from the foot passengers and the houses, while the fast traffic is itself freed from the continual necessity of closely watching the traffic coming in from side streets, and can safely adopt a higher average speed than when running close to the footwalks.

The meeting of the Town Planning Institute at which Mr. Brodie's paper was read was held at the offices of the Institution of Municipal and County Engineers, 92 Victoria-street, S.W. The chair was

accompanied by Mr. Raymond Unwin, and there were present Sir George Gibb, chairman of the Road Board, Captain G. Swinton, R.E., Prof. S. D. Adshead, Messrs. Patrick Abercrombie, H. V. Lanchester, C. J. Jenkin, engineer to the Finchley Urban District Council, E. G. Allen, Henry E. Stilgoe, city engineer and surveyor of Birmingham, A. S. Soutar, G. Marsh, J. W. Cockrill, borough engineer and surveyor of Great Yarmouth, H. Percy Boulnois (Westminster), Edmund R. Abbott, clerk to the Ruislip-Northwood Urban District Council, Thomas A. Mawson, Henry R. Aldridge, Rees Jeffreys, secretary to the Road Board, Edward Willis, engineer and surveyor to the Chiswick Urban District Council, and G. L. Pepler, hon. secretary to the Town Planning Institute.

DISCUSSION OF MR. BRODIE'S PAPER.

Mr. H. E. Stilgoe, city engineer of Birmingham, proposing a vote of thanks to Mr. Brodie for his paper, remarked that the latter had shown most clearly how economical it was to provide for the laying out of wide streets in the first instance. He had shown how streets which had been widened to 60 ft. in recent years had subsequently to be widened to something greater—120 ft. had been quoted. The exercise of a little foresight would have avoided that extra expenditure. But while considering the width of the street, they must see that the buildings were kept set back as far as possible, because if at some future time it was again necessary to widen, the purchase of forecourts was comparatively easy. Mr. Brodie did not advocate making up the street to its full width at once; his idea was to make the carriageway just as wide as was necessary and plant trees and make footways. The final width over the area pegged out could be carried out as time and traffic requirements showed it to be desirable. Mr. Brodie had showed how these streets might be used as elongated parks. He was in agreement with him. He was opposed to the idea of city flower gardens, being more in favour of the provision of playing-fields, which could be acquired in the suburbs of most towns at a cost of from £120 to £200 per acre. There were many other ways in which the wide street proved economical. Water, telephone and other services could be laid in the footpaths, and prevented the streets being eternally cut up with cross trenches. Then there was the economy in tramway construction. A matter of £3,000 was saved per mile in double-tracked sleeper construction; greater speed was possible, there was less noise in running, and a lower maintenance cost. In Birmingham the cost of repairing tramways was £300 per mile of single track, and almost the whole of that could be saved. Finally, the judicious laying out of arterial highways permitted of the ordinary estate streets being laid out of less width and of more moderate construction.

Sir George Gibb, chairman of the Road Board, said he agreed with Mr. Brodie that every effort should be made to prevent bricks and mortar covering every inch of unbuilt-on land at the outskirts of towns. He was also with him in wishing for wide streets, but he did not know that he followed him exactly in the great widths that he advocated. One must take account of the varied aspects of the question, and the decision must be based on the consideration of all these points of view. Personally, he confessed that he did not like straight roads—æsthetically, he meant. The idea of taking a map and putting straight lines upon it was a great mistake to his thinking. He was in agreement with Mr. Brodie as to securing as much land as possible, but it was a question well worthy of discussion whether, instead of providing strips of ground along the roads for recreation and other purposes not strictly connected with traffic, it was not better to have the land in the form of playing-fields. He was inclined to favour the latter course. Then as to traffic and width of roads. It was no use talking about the widths of roads in the abstract. It was a question that had to be decided according to the circumstances in each case. It was unwise not to have foresight, and equally unwise to have too much foresight; but he doubted the traffic value of any road much over 80 ft. in width. He was, of course, excluding all considerations except that of traffic. For traffic purposes he thought he preferred the duplication of the road to excessive width. Very wide roads were dangerous to the pedestrian, and the regulation of the traffic became necessary. People spoke of arterial roads without any proper appreciation of what they meant. Each locality had its own interests and its own views. People spoke about the need for co-ordination, but if each local authority were encouraged to prepare its own town planning scheme he did not think much difficulty would be experienced in constructing out of the various schemes a road which, if not an absolutely straight line, would at any rate be a good, satisfactory arterial road in the end.

Mr. H. Percy Boulnois (Westminster) said he agreed with a great deal of what Mr. Brodie had said regarding wide roads. After all, the actual carriageway was a question of traffic, which was of the greatest importance; they must design the actual carriageway to meet the requirements of the traffic. As to the width between houses, some people favoured forecourts or gardens. Personally he thought these—particularly those in small property—were neglected and were no good whatever. He considered that a double set of carriageways with a green strip in the middle, and wide footways, was the right class of road for nearly every sort of town. On the matter of tramways he supported Mr. Brodie in his view that these should be in the centre of the road, and, if possible, screened by hedges; but he considered that as a means of transit tramways could now compete with the motor omnibus. That was well established. The fact was that the tramway was a light railway, and should be used as such. There was the danger that these lines would take the people away from the towns to districts where they would be exempt from the payment of rates for the privileges they were getting; but their usefulness could not be denied. They were a necessity in all arterial road schemes, and, if properly designed, would not be a disadvantage, as was exemplified by the line laid down at Southend-on-Sea. Mr. Brodie had not advocated the laying out of broad roads solely for utility purposes, but as excellent promenades for those desiring fresh air and exercise. London lacked anything of that kind, much to his regret. The little corner plots which Mr. Brodie had advocated was another good idea. There was one point in connection with the provision of the proposed boulevards, and that was that they would be made use of by heavy traffic. That, however, could not be prevented. Another important matter was the cost of maintenance of these wide roads—maintenance, lighting, scavenging, and so forth—while it was proverbial that such thoroughfares were bad for shopping. So there must be some judgment exercised in the provision of these wide streets. He congratulated the author of the paper. Mr. Brodie was an enthusiast, but, unlike most enthusiasts, he was a level-headed man, and what he said to-day on the question of town planning the world would think about to-morrow.

Mr. E. R. Abbott, clerk to the Ruislip-Northwood Urban District Council, stated that the town planning scheme of his authority provided, in the first place, for 80-ft. roads. The landowners, however, fought rather shy of the idea, and it was ultimately agreed to come down to a width of 60 ft. But even with that reduced width they found that the owners were not willing to bear the extra cost of construction, and further concessions had to be made in their interests.

Mr. C. J. Jenkin, engineer and surveyor to the Finchley Urban District Council, put forward a plea for the unification of treatment of roads through the whole area of London. He considered that, both from the point of view of economy and safety, it was desirable to put tramways in the centre of the road. As to open spaces, it was not advisable for small children in the poorer districts to go far from their homes; it seemed, therefore, far better to have grass margins in the streets of such localities.

Captain G. Swinton (Road Board) expressed the belief that if they were laying out towns again in this country, the way to do it would be on the system of radial parks. By running their roads out through parks getting wider and wider as they proceeded, they arrived at the solution of the problem.

Mr. Henry R. Aldridge remarked that the great thing was to have the necessary distance between the houses.

Prof. Adshead took objection, on æsthetic grounds, to the placing of tramways in the centre of a street.

Mr. J. S. Birkett suggested that very wide roads would be likely to increase the cost of living, because he understood that in Germany the building land on each side of the very wide thoroughfares in that country had risen enormously in value.

Mr. Thomas A. Mawson remarked that a 120-ft. road suggested a terrible sense of vacancy. All streets, whether wide or narrow, might be considerably im-

[illegible] a little more practice were paid to the [illegible] planting trees along them.

Mr. Barnes, in replying, said the subject was, to his mind, one of very great importance at the present time. There was room for differences of opinion. Sir George Gibb disagreed with him on the question of [illegible] a chance of getting plenty of money from the central authorities to carry out wide roads in the way that they should be carried out, he might be prepared to [illegible] street improvements in Liverpool, but when he told [illegible] time were getting from the tramways undertaking towards the relief of the rates up to £100,000 a year, they would see that in doing the best he could for the tramways he was also doing the best he could for road improvements. It did not matter at all whether the £100,000 was earmarked for street improvements or not when looked at from the large point of view. He was bound to help to improve the tramways income, otherwise the profits from the tramways might disappear. If the traffic was going to be carried by the Lancashire and Yorkshire on their electric line, by the Overhead Railway, or carried through the tunnel under the Mersey to Cheshire, the source of income from the tramways disappeared altogether. He believed that tramways properly designed and carried out would ultimately beat the motor 'bus; but, as he had pointed [illegible] meeting at Newcastle recently, tramways had got to be speeded up, and at the same time improved, in order to do away with such nuisances as noise. On this latter subject he mentioned that two or three tramway people were looking into his suggestion to use rubber tyres for tramcar wheels. To prevent children straying on to the tracks low privet fencing had been put down on each side of the tramways. There was not the same difficulty in crossing the wide roadway in Liverpool as there was in crossing the Embankment. A width of about 30 ft. was left in the middle of the road, and there were two 24-ft. carriageways, and the two lines of traffic could be separately negotiated quite safely. He had deliberately made the crossing and stopping places not nearer together than about 300 or 400 yds., because if high average speed were required there must not be too many stops. He insisted upon making a road safe, and the way to do that was to make it wide enough and divided up so that traffic was properly dealt with. Captain Swinton's idea of radial parks was a very good one, but he did not think there was anything of special value in making the parks wider as they extended outwards. Really wide roads would do, but those he was proposing at present were not "really wide." He did not think that we as a nation were entitled to consider that we had put down wide roads considering that other countries had some 350 and 400 ft. roads with parklike or playing areas between the carriageways. Sir George Gibb had suggested duplicate roads, but it would be found very difficult to get even a very limited number of wide roads, especially through built-up areas. As to the question of playgrounds, to which Mr. Boulnois had referred, he did not think they could find space for these in a 120-ft. [illegible]

Supply of General Stores.—In a report submitted [illegible] Council, the Stores and Contracts Committee of that body state that the curent contracts for the supply of general stores will, with a few exceptions, expire on December 31, 1914, and that they are taking steps with a view to obtaining supplies during the year 1915. This group of contracts, which ordinarily comprises upwards of forty schedules, is the largest of the several groups dealt with each year, and generally includes all such goods as metals and metal goods, electric cables, lamps, fittings and materials, petrol, oilman's sundries, glass, horticultural goods, rubber goods, chaff and fodder, soap, leather, baskets, mats, &c. &c. Owing to the special circumstances which have arisen in consequence of the war, it is proposed in some cases to purchase goods during 1915 at the current market rates or under special quotations until trade conditions again become normal, or until it is considered that the time is favourable for new contracts to be entered into. In all other cases, however, new forms of tender and schedules have been prepared, and will be issued shortly.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Would it not be a popular and patriotic movement on the part of our Members of Parliament if they would, each and all, contribute their £400 a year to the funds for providing field ambulances? And would not our wounded soldiers bless them for having aided in supplying them with this very necessary adjunct to the battlefield?

* * * *

Has [illegible] Council of the Institution of Municipal and County Engineers acted very wisely in deciding not to hold the proposed "National Road Congress" next year, or to co-operate with the County Councils' Association in this proposal? Was it not evident from the first, irrespective of the question of war, that the proposal to hold such a joint conference might have resulted in various complications?

* * * *

Is there not a good deal to be said in favour of systematic "air blowing" into sewage in order to keep down the smell? Shall we not all look forward to some further reports from Dr. Fowler and Mr. Watson as a result of the experiments they are carrying out at Manchester and Birmingham respectively on this important point? Are there not still a large number of sewage disposal works in this country where very objectionable smells are frequent?

* * * *

When will the Engineering Standards Committee be ready with their long-looked-for "Standard Specification for Road Stones"? Are we not all looking forward to its issue with considerable interest?

* * * *

Are not the Chadwick Free Public Lectures which are to be given during November and December, of just the right description at this time? Are not such subjects as camp, ship and hospital hygiene, military sanitation in the Tropics, war and disease just the very matters on which scientists and the general public require information and instruction at this moment of stress and danger to our noble fellow countrymen in the field?

* * * *

Is it true that the expert committee formed by the Roads Improvement Committee to investigate the claims of the 700 horseshoes which were submitted in competition for the 100-guinea prize have, after protracted investigation, been unable to find so perfect a shoe as will warrant their recommending that this prize should be given? Is it not also rumoured that the committee are proposing to recommend that three prizes of 20 guineas each be awarded for the best type of shoe in which a rubber strip pad is fixed in the heel, or grooved, with tarred gaskin or rope firmly fixed in the groove? Shall we not await with interest the public [illegible] of the awards and the reasons for the [illegible]

Cement Waterproofing. The architects for the Yarm Territorial Headquarters, Middlesbrough, report that they have used the cement waterproofing powder Pudlo in the basement of this building, and that the result has been extremely good.

Society of Engineers.—On Monday next, at a meeting of this body to be held at the Institution of Electrical Engineers, Victoria Embankment, W.C., Mr. James Tonge, M.I.MECH.E., F.G.S., will read a paper dealing with the uses of the hydraulic mining cartridge. The chair will be taken at 7.30 p.m.

The Local Candidate in America.—The modern tendency among men who are trying to promote efficiency in the public service is to get the best man for the job—at home, if possible, otherwise abroad. And in every city where the new idea has taken hold there is the same shout to "keep the jobs at home." It all depends upon the point of view. If the municipality is more interested in providing jobs for its home people than in developing efficient government, of course the proposition to hire out-of-town experts is wholly unjustifiable. But if efficient and satisfactory service is to be taken as the chief end of municipal government, it is quite obvious that when the right kind of a man is not available at home, he should be looked for wherever he is to be found. *Cincinnati Times-Star*

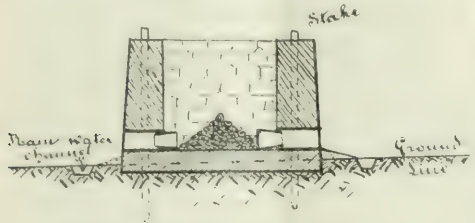
Camp Sanitation.

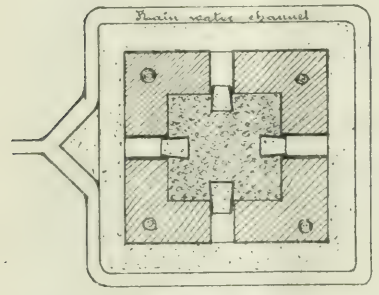
(2.)—REFUSE DISPOSAL.

By G. BERTRAM HARTREE, F.S.I., Engineer and Surveyor to the Alton, Hants, Urban District Council.

The disposal of refuse is a matter that received attention in the earliest camps recorded in history. A very old work referring to an expedition that left Egypt for Judæa states that stones were fixed at a considerable distance beyond the camp, and inscribed: "All rubbish to be deposited beyond here." Evidently these people were well supplied as to the necessity for removing refuse to prevent nuisances from smells, but apparently, having got rid of it to a distance from the camp, they made no arrangements for destruction. While the removal prevents the olfactory nuisance, the accumulation, wherever it may be, must lead to another equally objectionable.

The deposit of eggs by flies, and the maggots that follow, are an acknowledged source of danger to the community, and in dealing with camps, as with





Built-up Incinerator.

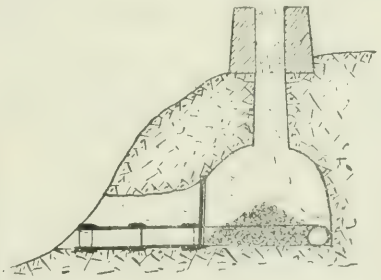
dwellings, arrangements should, where possible, be made for refuse destruction. All camp refuse should be removed daily, and whenever possible burned; otherwise it should be buried. Possibly for temporary camps the last-mentioned precaution is sufficient. For more permanent camps some form of destruction is desirable. Camp incinerators are made from any materials at hand; bricks or large stones are, of course, very suitable, but in their absence turf or similar substance may be used. Where neither material can be obtained sheets of galvanised iron may be adapted.

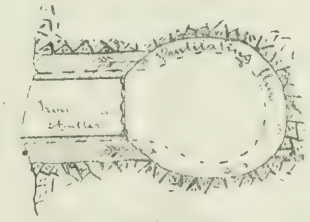
The erection of the familiar type of destructor with a towering chimney shaft is impossible, but exceedingly useful incinerators may be constructed with any of the foregoing materials, and square or circular in shape, as circumstances warrant. When galvanised iron is used the circular shape is preferable, and a base support of earth and sods is imperative; the iron is bent to shape and the ends secured by wire. Three sheets are the most effective number to use. Should turf be the local material, my preference is for the square shape, as four suitable stakes driven from the top through to the base and into the ground form excellent stiffeners at the angles.

A useful type of incinerator measures 3 ft. to 4 ft. internally, and is 3 ft. to 4 ft. in height; no flue other than the full opening is provided, but an effective draught at base is necessary. The holes for this purpose (which should not be less than four in number) may be arched over in brick or stone, or 9-in. drain pipes provided; although orthodox construction requires the popular bully beef tins with their bottoms knocked out and socketed together to make the requisite length that will allow a projection inside of at least 6 in. Whatever material is adopted for draught flues, tins are very suitable for the inside terminals, as, by leaving the bottom unbroken, perforations may be made at suitable points to lead the draught in the desired direction. A heap of stones, either conical or pyramidical in shape, and not less than 15 in. in height, is desirable on the floor to assist the draught and to retain the heat. After the consumed material is removed, damp or wet refuse may be placed on these stones to assist its partial drying. A temporary roof is desirable during this operation. I have seen a useful form of incinerator made by excavating a small cavern in the side of a hillock, sinking a flue from the top, and filling up the entrance, but leaving space for draught flues. In this type the draught or ventilating flue is more effective if carried around, as shown in sketch, and is further improved by the use of tins with suitable perforations, and a free current of air can be obtained at any point.

As with the town destructor, an auxiliary fuel is generally required for firing up; paraffin oil and dry paper, or other fuel, should suffice for the purpose, and by careful attention the fire should burn day and night.

In order to keep a camp in a sanitary condition it is imperative that solid or liquid refuse should be prevented from remaining on the surface of the





Excavated Incinerator.

ground; this course is equally necessary for waste from kitchens as with fæcal matter. Solid matter should be constantly removed and destroyed in incinerators, while liquids may be disposed on grease soakage pits. These should be provided in pairs near the kitchens, one to arrest the grease, the other to receive the clear liquor. To prevent the grease stopping the earth pores and forming scum to attract flies, the primary pit is filled with dry, absorbent material.

Paper, straw, heather, or brushwood are suitable filtering media, and should be removed as soon as fouled and burned in the kitchen fires. On land of heavy character a filter would be advantageous; this could be made from an empty barrel or box with perforations in the bottom. The filtering media may consist of layers of charcoal covered by stout paper,

rubble drain leading to a soak pit. This form of must be burned.

Quicklime is invaluable in camp sanitation, and with a suitable local stone the provision of a lime-kiln is of advantage. Either the intermittent or constant feed type could easily be constructed with selected blocks of limestone set in clay and plastered outside with the same material; or, under favourable conditions, an excavation may be made in a hillside in a manner similar to that illustrated for refuse destructors.

2nd (RESERVE) LONDON SANITARY COMPANY.

Captain Arthur J. Martin, R.A.M.C., T.F., writes as follows from the Duke of York's Headquarters, Chelsea, S.W., under date of Wednesday last:

"Your readers will be glad to hear that, thanks to the publicity which you so kindly gave to my recent appeal for recruits, and the good offices of the various professional societies, the ranks of this company are now filled.

"As will be seen by the enclosed lists, a large proportion of the members of the company and of the Imperial Service Company are in civil life officers of the various local authorities. We have besides many engineers, architects, chemists and others whose civil occupations eminently fit them for the duties which they will have to perform.

"As an engineer, I am proud of the way in which the members of my own and allied professions have come forward—in many cases giving up good positions—and placed their ability and experience at their country's service.

"I am still receiving daily many applications from well-qualified men in all parts of the country. I am placing their names on a waiting list with a view to filling casual vacancies. They will also, of course, be available in the event of the War Office deciding to form any additional Sanitary Companies."

2nd (Imperial Service) London Sanitary Company.

Major C. E. Goddard, medical officer of health, Wembley Urban District Council (O.C.); Captains C. M. Fegen, medical officer of health, Croydon Rural District Council, and P. N. Cave, assistant medical officer of health, Croydon Rural District Council; Lieutenant W. J. Slowan, education department, London County Council; staff-sergeant H. E. Brown, sanitary inspector, Wandsworth Borough Council; sergeants H. A. Palmer, sanitary inspector, Wandsworth Borough Council, and S. D. Lewis, public health clerk, Wembley Urban District Council; lance-sergeant T. H. Robey, public health clerk, Fulham Borough Council; corporal W. Edwards, mortuary keeper, Wandsworth Borough Council; lance-corporals F. H. Manning, sanitary inspector, Fulham Borough Council; E. J. Pitts, public health clerk, Bermondsey Borough Council, and A. H. Blake, disinfector, Wandsworth Borough Council; privates M. Caxton, sanitary inspector, Fulham Borough Council; W. H. Brown, disinfector, Wandsworth Borough Council; C. M. Meir, public health clerk, Bermondsey Borough Council; R. Langmaid, public health clerk, London County Council; N. J. Osborne, sanitary inspector, Bushey Urban District Council; E. Partridge, public health clerk, Wimbledon Urban District Council; F. J. Kendall, public health clerk, East Ham Urban District Council; H. Hilliman, public health clerk, Wandsworth Borough Council; W. J. Eversett, sanitary inspector, Congleton Urban District Council; R. A. Baskett, public health clerk, East Ham Urban District Council; G. Ellison, sanitary inspector, Hornsey Urban District Council; A. Stratton, clerk, Port of London; A. G. Salter, clerk, Metropolitan Water Board; D. H. Pickard, sanitary inspector, Wimbledon Urban District Council; W. T. Carter, bath superintendent, Wimbledon Urban District Council; G. H. Williams, assistant sanitary inspector, Hereford City; and A. J. Franks, disinfector, Borough of Brighton.

2nd (Reserve) London Sanitary Company.

Captain Arthur J. Martin, M.Inst.C.E. (O.C.); Lieutenant F. G. Caley, tuberculosis officer, Wandsworth Urban District Council; staff-sergeant W. Hadingham, porter, Metropolitan Asylums Board; sergeants W. Gibb, clerk, Metropolitan Asylums Board, and S. Pickering, fitter, Metropolitan Asylums Board; corporals L. Skeeles, sanitary inspector, Southgate Urban District Council, and E. Tyler, disinfector, Wandsworth Borough Council; lance-corporal W. G. Lake, assistant superintendent, Bermondsey Borough Council; privates L. Loughlin, sanitary inspector, Willesden Urban District Council; J. G. Francksen, public health clerk, Bermondsey Borough Council; G. N. Ede, rating surveyor, London County Council; A. P. Piggott, assistant surveyor, Stoke Newington Borough Council; J. Mernagh, hospital attendant, Metropolitan Asylums Board; W. E. Clark, clerk, Bermondsey Borough Council; R. Opie, assistant surveyor, Derbyshire County Council; P. Stebbing, architect, H.M. Office of Works; H. Steele, sanitary inspector, Dewsbury Urban District Council; R. H. Coad, public health clerk, Corporation of Burnley; T. M. Reed, sanitary inspector, Brandon Urban District Council; C. P. Page, assistant clerk of works, London County Council; A. Henessey, assistant sanitary inspector, Borough of Bacup; E. E. Riddell, sanitary inspector, Wath-upon-Dearne Urban District Council; E. F. Gibbon, sanitary inspector, Haverfordwest Rural District Council; G. F. Guy, assistant surveyor, Kingswinford Rural District Council; G. Lawson, assistant sanitary inspector, Edinburgh Town Council; G. T. Hill, sanitary inspector, Hitchin Rural District Council; E. Wilson, clerk of works, Borough of Westminster; G. H. Hammond, sanitary inspector, Borough of Leamington; T. T. Thomas, sanitary inspector, Holywell Urban District Council; C. Clerk, sanitary inspector, County Borough of Derby; R. McKenzie, sanitary inspector, County Borough of Lanark; E. Roberts, sanitary inspector, County Borough of Burnley; H. Aliffe, sanitary inspector, County Borough of Burnley; J. D. Keele, surveyor, London County Council; and W. Balchin, sanitary inspector, Heston and Isleworth Urban District Council.

DEATH OF MR. W. B. BRYAN.

CHIEF ENGINEER TO THE METROPOLITAN WATER BOARD.

We deeply regret to learn that Mr. William Booth Bryan, chief engineer to the Metropolitan Water Board, died suddenly in London on Tuesday night.

Mr. Bryan was born at Nottingham in 1848. He was educated at Nottingham Grammar School, and articled to Mr. O. Tarbotton, M.Inst.C.E., F.G.S. In 1870 he became assistant engineer to the Nottingham Corporation, and the Nottingham and Leen Valley District Sewerage Board; in 1873 he was appointed borough engineer and surveyor of Burnley; and in 1875 borough and water engineer of Blackburn, retaining until 1878 the post of engineer to the Sewage Committee of Burnley. In 1882 he was appointed chief engineer to the East London Waterworks Company, but remained as water engineer to the borough of Blackburn until the completion of new waterworks in the hills of the West Riding of Yorkshire and Lancashire. In 1904 he took up the appointment of chief engineer to the Metropolitan Water Board.

Mr. Bryan was a member of the council of the Institution of Civil Engineers, and a member of the Institutions of Mechanical Engineers, Water Engineers, and Municipal and County Engineers; was president in 1907 of the Junior Institution of Engineers; a Fellow of the Royal Meteorological Society; a member of the Franklin Institute, Philadelphia, and the New England Waterworks Association; and an honorary member of the Association des Ingénieurs et Hygiénistes, Paris.

New North Wales Road.—The new through road between Llandudno and Colwyn Bay, which is to be made by the two local authorities through a joint committee, with funds largely contributed by the Road Board, will find considerable employment for unskilled labour during the coming winter. At the last meeting of the Llandudno Council the clerk (Mr. Conolly) stated that at present the only cause of delay in the commencement of the work is as to the execution of one agreement with regard to the acquisition of land.

THE PRACTICAL TRAINING OF ENGINEERS.

SPECIAL COMMITTEE'S REPORT.

The report of the special committee appointed by the Council of the Institution of Civil Engineers to inquire into the question of the practical training of engineers has been issued. The inquiry was undertaken as a result of the proceedings of the conference on the education and training of engineers held at the institution in June, 1911, and had a very wide attempt to define and regulate the conditions of practical training for young engineers was thought necessary to make inquiry into the matter. The question was one as to the most practical means of securing adequate practical training to those who intend to become engineers, and as to the conditions under which such training might be rendered readily attainable by well-educated young men, and especially by those who have undertaken regular college study. The inquiry was summarised in nine questions, and information was invited as to the views, as well as the practice, of those who were approached upon the considerations involved in the several questions. The list of those to whom the questions were put was compiled in such a way as to ensure the inclusion of a considerable number of representative engineers in private practice, as well as of those in charge of public engineering administrations, and of manufacturing engineering firms. The report contains a numerical summary of the answers received from the following groups of engineers: (1) Engineers in private practice; (2) railway engineers, railway mechanical engineers, and dock engineers; (3) municipal engineers and engineers of waterworks and gas works; (4) general engineering engineers—with, in addition, an analysis of the answers in each of the eight individual branches comprised in those groups. The committee learned with satisfaction that, while considerable uncertainty pervades the subject of practical training in regard to the details which should constitute it, there is a disposition among employers to consider favourably any proposals which may be thought likely to improve and define more clearly the conditions that should be observed for such training in the various branches of engineering practice; and that considerable interest is evinced in the matter of improving the coordination of scientific study and practical work, which was one of the important points remitted to the committee for their observations and recommendations.

COMMITTEE'S CONCLUSIONS.

The result of the inquiry and consideration of the views and opinions submitted led the committee to the following conclusions:—

(1) That, as the institution by-laws already provide for the necessary minimum period of practical training, and recognise the dependence of that period upon the educational and scientific attainments of the individual, it is unnecessary for the council to deal further with that point.

(2) That, while not touching the question of what consideration should be involved for the privileges and opportunities of training—a matter in regard to which there is considerable diversity of practice—notably so in certain branches of engineering, it seems to be clear that some kind of agreement or defined arrangement is desirable where a young man seeks special opportunities of becoming conversant with a reasonably wide range of professional work, and where an engineer is willing to offer such opportunities within certain limits, either for a premium or in return for services rendered by the pupil.

(3) That it would be very useful to the institution, the engineer, and the pupil, if agreements relating to practical training were accompanied by statements containing in outline the heads of the several classes of work of which experience might be obtained during the period of training. Such a statement would assist, especially where there are no articles entered into, in making clear the position of a pupil as distinct from that of an ordinary assistant; and the production of such a statement of work, marked by the master to show what items had been dealt with during the period of training, would be of service to the council in deciding at a later stage as to the qualifications of a candidate for election.

From the very full information furnished to the committee in regard to the classes of work which are engaged in by learners in various branches of engineering, schedules have been prepared containing a synopsis of the more important features in eight groups or divisions of engineering practice, the basis of classification being that employed for the institution's periodical conferences. The waterworks and sewerage and municipal engineering schedules are reproduced herewith:—

It is not supposed that any individual could gain reasonable experience of more than a limited portion of the various items of work in these lists during the short period of a pupilage; but it is pointed out that information of the nature of the experience which has been obtained during any course of practical training will be useful to the council, and especially to the committee which deals with the preliminary qualifications of candidates for election. The schedules are not intended to imply or involve a direction to engineers as to the particular work in which they may find it desirable to employ their pupils; but they are expected to afford a convenient means of indicating what range of experience has been obtained. All cases of practical training, whether obtained in the capacity of a pupil, an apprentice, or an assistant, are required to be the subject of some arrangement or agreement, and where no articles or indentures are entered into, a statement of the arrangements made will have to be made where the person under training is recommended for admission as a student.

Finally, the committee's report—which has been adopted by the council of the institution—requests members to give special consideration to those who, having obtained exempting degrees and diplomas, desire to obtain practical training, whether as pupils, apprentices, or assistants under agreement, for the shorter periods allowed by the by-laws as a condition of election in the cases of men who possess those qualifications. The suggestion is made that some agency, such as the Civil Engineers Appointments Board, might be utilised to place in communication properly educated young men who seek such training with engineers who may indicate willingness to afford it.

Birmingham Corporation Employees and the War.—At a meeting of the Electric Supply Committee of the Birmingham City Council on Wednesday it was reported that as a result of the war 147 of the staff and workmen of a total of 615 were on active service, and that allowances were being made to them in accordance with the resolution of the City Council. The total amount paid at the present time was at the rate of £4,590 per annum.

The Functions of a Municipal Engineer.

By Prof. E. R. MATTHEWS, [illegible], Chadwick Professor of Municipal Engineering in the University of London

(Conclusion.)

[illegible]

[illegible] to observe the waste of water and labour which occurs in the usual methods adopted in street watering. [illegible] road, 38 ft. wide. The water cart with its spreaders [illegible] 16 ft. Assume that the old-fashioned spreaders are in use, which do not admit of one side being shut off and the other only in operation; the result is that, to water the road the full width of 38 ft., the water cart must pass over the road three times. But 16×3 = 48, and all we require to water is 38 ft.; therefore 10 ft. of the road is watered needlessly. Water is thus wasted and labour, and the use of the horse, which might have been otherwise employed. The method I have adopted in watering a road, say, of that width is to water the sides of the road, including the channels, and to leave the centre of the road. I find that the dust on a road does not accumulate in the centre, but blows towards the channels, and this is where the watering is needed. The centre strip of the road need not, indeed, be watered. The Westminster City Council, I notice, are using a very useful motor vehicle in the shape of a cylindrical water cart, which probably holds 1,000 or more gallons of water, and this vehicle flushes the channels of the road in a very rapid way. I advocate the use of such.

I now propose to deal briefly with another branch of municipal engineering—namely, waterworks engineering—and to have something to say on the

[illegible] CONSTRUCTION.

First let me set out some of the advantages of using this material.

There is a growing tendency on the part of engi[illegible] of Europe, to construct service reservoirs in reinforced concrete. A notable example of this may be quoted in the case of the new reservoir recently constructed at San Francisco. Mr. Shaughnessy, the city engineer of San Francisco, has—wisely, I think—used reinforced concrete in the construction of this reservoir. The advantages of using this material for this purpose are many:—

(*a*) There is a saving in first cost.

(*b*) A reservoir built in this material occupies less space than one constructed in masonry or brickwork, or a combination of both.

(*c*) It can more easily be made watertight.

(*d*) It increases in strength with age.

(*e*) There is less likely to be vegetation upon the face of the walls.

(*f*) Practically no cost in maintenance.

[illegible]

In the United States most of the modern reservoirs are circular in plan. Reservoirs of this shape are seldom constructed in this country, British engineers preferring a rectangular structure. I recommend the circular shape, the chief advantage being that when of this shape no angles occur, so that the reservoir wall can be built without a joint. This is a great advantage, for one often finds that when leakage occurs in a reservoir it can be traced to the point where the walls join. Circular reservoirs, because of their circular form, are also better adapted to withstand external earth pressure; they are cheaper than rectangular ones.

The San Francisco new reservoir previously referred to is a good illustration of the circular type of reservoir. This may be briefly described as follows:—

The reservoir was completed about two years ago. It is known as the "Twin Peaks" reservoir, and is a good example of what may be done in reinforced concrete. It is oval in plan, and divided into two parts by a reinforced-concrete dam. The reservoir is situated 750 ft. above the business section of the city, and is part of the [illegible] system for fire-extinguishing purposes established in consequence of the terrible fire of 1906. The dimensions of this reservoir are 370 ft. by 285 ft. in area, and the depth of water allowed for is 27 ft., or a capacity of 11,000,000 gallons. The buttresses of the dam are spaced at 9-ft. centres on both sides of the wall. They are 1 ft. in thickness, and 13 ft. wide at the base.

WATERTIGHT RESERVOIRS.

Referring to the leakage of reservoirs, we must say that this is a problem which has engaged the serious attention of engineers for many years past. Reservoirs have been constructed in what appeared to be a substantial manner, on a good foundation, and at a cost of many thousands of pounds, but they have never ceased to leak, and while many attempts at remedying the leakage have been made, these constructions are looked upon, from an engineering point of view, as a failure.

I know of no type of reservoir, however, which is more likely to be watertight than that constructed of reinforced concrete, provided the reservoir is properly constructed and expansion joints are inserted in suitable positions both in the walls and floor of the reservoir, and if suitable material is used for the concrete, and the walls are not less than a minimum thickness of 5 in., and are well reinforced, and that the depth of water in the reservoir does not exceed, say, 30 ft.

The thickness of the floor will depend entirely upon the sub-foundation. This floor may be either of plain or reinforced concrete; if the latter and the sub-foundation is good, the thickness of floor should not be less than 6 in. for a depth of water up to 15 ft., and 9 in. for a depth ranging from 15 ft. to 25 ft., and 12 in. from 25 ft. to, say, 35 ft. In every case it is assumed that the floor is well reinforced. In order that the reservoir may be watertight, in addition to the beforenamed precautions, great care must be taken as to the properties used in the concrete. I would suggest that never should a weaker mixture be used than 1:2:4, and where the depth of water to be stored is not less than, say, 20 ft., I would recommend a mixture of 1:1½:3. The materials should be very carefully graded, as most of the trouble in reservoir work occurs where this has been imperfectly done.

[illegible] mixture shall always be used, and while a dry mixture may show a better result as regards its strength in compression, and a plastic mixture may also give better results in this way, still a wet mixture more perfectly prevents leakage, and on that account should always be used.

Not only so, but with a wet mixture the reinforcement is better covered. I have seen reinforced-concrete work where a fairly dry mixture had been used, and where occasion had arisen for the breaking up of the concrete, where the reinforcement in places had not been covered in the least degree by the concrete. This had occurred, first, because the mixture was too dry, and, secondly, because the aggregate used was too large. In practice the concrete should be of such a consistency that every portion of the reinforcement will be well covered, and every crevice filled.

Not only is this obtained by using a wet mixture, but with such a mixture when the forms are removed there is a smooth face to the concrete, and on this account also it is wise that the mixture should be fairly wet. Care, however, must be taken to see that it is not too wet. It is possible for too large a quantity of water to be added so that the grout will run through the joints in the forms, and escape from the wall; on no account should this occur. If reservoir walls are constructed with a mixture of 1:2:4, the ultimate strength of this concrete, assuming well-graded stone and sharp sand is used as the aggregate, will be about 2,000 lb./in.² at the termination of one month, and 2,700 lb./in.² at the end of six months. The usual working stress for good concrete is taken at 600 lb./in.² Under exceptional circumstances, however, this may be reduced to, say, 500 lb./in.², but I would recommend, generally speaking, for reservoir work 600 lb./in.².

RESERVOIR PIERS

These are sometimes built circular in plan, and there is a slight saving in the space occupied by so doing. It is, however, more costly to construct the forms in this shape, and the advantage of saving in space does not many cases pay for the increased cost. The usual practice in this country is to build rectangular piers, and to round the edges, say, with a 12-in. circle. 9 in. 12 in. or 12 in. square piers. The square piers have the advantage that they afford a better seating for the roof slab to rest on, thus carrying the load to rest upon.

RESERVOIR ROOFS

In reinforced-concrete reservoirs the roof usually consists of a reinforced-concrete slab 4 in. or 6 in. in thickness, carried by right-angled beams which rest on the piers just referred to. Some engineers prefer a lighter slab and to obviate this they introduce a system of secondary beams. For my own part I do not like the roof slab to be of greater thickness than 6 in., but it is preferable, and the beams can be designed accordingly. In calculating the weight of the roof it is necessary to include the weight of concrete and reinforcement forming the beams and slabs, also to allow for any soil which may be spread on the roof. This is usually about 1 ft. or 18 in. in thickness, also to assume a thickness of snow of, say, 2 ft. It is necessary to construct two or three openings in the roof for the purpose of getting to the inside of the reservoir, and iron ladders are usually built in at these points. The openings need not be larger than 6 ft. by 3 ft.

CEMENT GROUTING

It is always advisable after short sections of the work have been completed to wash the walls over with two coats of cement grout, 1 to 1 (sand and cement). This fills in any slight cracks which may have occurred on the setting of the concrete. A full night should elapse before the grout is applied. No further cracks on the surface of the concrete will be likely to occur.

WETTING CONCRETE

If the reservoir is being built during the summer months, when the sun is likely to dry the surface of the concrete very rapidly, the latter should be frequently wetted so as to retard the drying action of the sun. It is also advisable to do this in high winds.

SIZE OF AGGREGATE.

In reservoir work the aggregate used in the construction of the walls, floor, piers and beams of the reservoir should be capable of passing through a ¾-in. ring; for the roof slabs it should be capable of passing through a ½-in. ring.

Where the thickness of the concrete floor exceeds 9 in. the aggregate should be capable of passing through a 1-in. ring, the upper 4 in. of the concrete in the floor should consist of concrete, the aggregate of which is capable of passing through a ¾-in. ring.

REINFORCEMENT.

It is not my intention to advocate any particular system of reinforcement. There are many in the market, and most of them are good, and I say this after having used several different systems myself. It is quite possible, however, and I strongly advise you to adopt this course, for the municipal engineer to work out his own stresses and design his own system of reinforcement.

THICKNESS OF WALLS.

For heads up to 10 ft. a 5-in. wall will generally be found to be sufficient; a 4-in. will answer, but I prefer a minimum thickness of wall of 5 in. It has, however, been suggested that the walls should be increased in thickness for every additional 5 ft. increase in head of pressure. I agree with this suggestion, but prefer that the top 6 ft. of the reservoir wall shall be 5 in. in thickness, and that the wall shall be increased in thickness by 2 in. for every additional 6 ft. of its height.

It is usually desirable to build counterforts or buttresses at the back of the wall.

There is a saving of from 20 to 25 per cent by using reinforced concrete in the construction of reservoirs. Some engineers recommend that the water face of reservoir walls shall be rendered with 1 to 1 cement mortar to a thickness of ¼ in. or ⅜ in., but I do not favour this; I think it is unnecessary.

STRESSES.

The elongation of steel being so much greater than that of concrete, it is advisable, in order to ensure of the reservoir being watertight, to limit the stress to 12,000 lb/in.², and I think it is advisable in reservoir work to use bars which give a mechanical bond, such as the indented bar, twisted bar, lug bar, or one of the other various types of bars, rather than plain bars, but this only applies to reservoir work, as plain bars are admirable for all other reinforced-concrete work.

It is necessary that an adequate percentage of steel be inserted in the concrete in both directions, even when the stresses due to water pressure occur in one direction only, or otherwise slight cracks may appear.

Reservoirs may be—

(*a*) Entirely sunk below ground.

(*b*) Partly sunk below ground.

(*c*) Out of ground.

In designing [illegible] ground, or the first type we must remember that the reservoir may be full or empty. When empty the walls will be acting as retaining walls with all the pressure at the back; when the reservoir is full there is still the pressure of the soil at the back of the walls, but counteracting this is the water pressure from within. It is therefore desirable that walls of this class shall have reinforcement on both sides, and not in the centre of the wall, as had the reservoir which failed at Mittagong, N.S.W., as we shall see presently when considering that failure.

This reversion of stress due to the reservoir being alternately empty and full is one reason why we should adopt low working values. It is not advisable ever to make any allowance when designing a reservoir wall for the earth pressure at the back of the wall, which is counteracting the water pressure from within. The surrounding soil may during a long period of hot weather dry and shrink back from the wall; in such a case the earth pressure would be greatly reduced. Not only so, but it may be found necessary at some time to excavate the soil outside the reservoir.

(*b*) *Reservoirs partly out of ground.*—These are known as the cantilever type. In determining the width of the heel we must remember that in an ordinary retaining wall the weight of the earth at the back of the wall would help to keep the wall from overturning, but with a reservoir the weight of the water should be disregarded. The heel should therefore be made of sufficient width and thickness to be stable when the weight of water above it is neglected. One of the most important things to be careful with in designing a reinforced-concrete reservoir is the arrangement of the bars at the joint between the vertical wall and the footing.

(*c*) *Reservoirs out of ground.*—These will be similar in design, but buttresses are usually added. The wall acts as a dam to withstand water pressure.

RESERVOIR ROOF

This often acts as a tie, and holds the reservoir walls together; the reinforcement is therefore arranged accordingly. When the span is large, however, the elongation may be considerable, and it is then not advisable to tie the walls in this way, but to give the roof free sides for expansion.

THE FAILURE OF A REINFORCED CONCRETE RESERVOIR AT MITTAGONG, N.S.W.

Engineers who are not in favour of the use of reinforced concrete are very ready to draw our attention to this failure; but this is unfair, for the reasons why the structure failed are quite clear, as we shall see in a moment.

We can always learn more from failures than from successes. This reservoir was 40 ft. diameter, and was built in connection with the water supply of Mittagong, N.S.W. It burst on January 22, 1909. It contained 32 ft. of water at the time of bursting. Once before it had been filled to a depth of 33 ft. 9 in. The reservoir was constructed on a solid rock foundation in an old quarry excavated 7 ft. deep on top of a steep hill, and when the structure burst the 240,000 gallons of water which it contained rushed down the slope; no damage was done, however. The lower half of the reservoir failed all round simultaneously; the upper half then collapsed.

The floor of the reservoir was 12 in. thick, and of plain concrete.

Design: Capacity of reservoir, 314,000 gallons; 40 ft. deep to top water level; shell of reinforced concrete, 4½ in. thick under coping, 10½ in. thick at bottom of wall, including ½ in. of rendering on inner face, and ½ in. on the outer surface.

meters lap. All intersections were tied together with No. 16 wires.

Unit Stresses.—In designing the shell no allowance ... that the steel rods would take the whole of the tensile stress due to water pressure.

The maximum tension in rods in the Mittagong reservoir at time of failure was only 12,750 lb.², although a tensile stress of 16,000 lb./in.² had been allowed for, and the adhesion was 80 lb./in.² at floor level. The tensile strength of the cement used at ...

Method of Construction.—The concrete bottom was first put in, then the timber framing was erected to the full height of the reservoir; the grill was then put in place and tied. Concrete boards were then put in in lifts of 2 ft. The concrete was hand-mixed and rammed in place, 3-in. by 1-in. battens being used, as these were found to be best for working the concrete around the reinforcement. The shell was finished in thirty-one days, and the reservoir was filled ninety-eight days after completion.

Causes of Failure.—These are pointed out by Mr. de Burgh, M.INST.C.E., in a paper read by him before the Institution of Civil Engineers; they were:—

(1) Defects in design.
(2) Defects in material.
(3) Defective workmanship.
(4) Other contributing causes.

The cause of failure was not due to the use of excessively high stresses in the steel reinforcement, but in the failure of the joints between the various horizontal rods. The concrete was in places insufficiently rammed, and too dry a mixture had been used.

In my opinion, apart from defective design, the time of setting before use was insufficient, and the adhesion of the concrete to the reinforcement imperfect.

What do we learn from this failure?

CONCLUSIONS.

(*a*) In reservoir work a tensile stress of 12,000 lb. per square inch is sufficient.

(*b*) A single central grill is not the best design, as it produces a weak plane through the centre of the structure.

(*c*) An allowance of 50 lb. per square inch adhesion for plain rods is ample, and this should be reduced at those places where the rods cross one another, and so prevent the concrete at those points from surrounding the bars.

(*d*) The concrete should always be a "wet" mixture.

This reservoir has been rebuilt to an amended design, the old bottom remaining. In the new design 50 lb. per square inch has been allowed for adhesion, and the maximum tensile stress is 11,189 lb. per square inch; this occurs at 6½ ft. above the reservoir bottom. Instead of a central grill, there is now a double row of vertical bars in the bottom two-thirds of the reservoir wall, which, in my opinion, should have been included in the first design.

ASSISTANCE TO THE WAR OFFICE.

There are many ways in which a municipal authority may assist the War Office.

Camping Ground.—One of the principal of these is by the purchase of land in or near the borough for the purpose of allowing this to be used as a military or volunteer encampment or manœuvring ground. Many local authorities have inserted a clause in their recent Bills dealing with this matter. The Bridlington Corporation Act, 1904, for example, contains such a clause, which is as follows:—

"The corporation may purchase or take on lease and set apart any land in or near the borough which, on the application of the corporation, may be approved by the Secretary of State for a military or volunteer encampment or manœuvring ground, and they may equip such land for these purposes or any of them, and they may maintain or let the same, and they may contribute out of the borough fund to the cost of the purchase, taking on lease, equipping, and maintaining of any land for these purposes."

In my opinion all municipal corporations who have suitable camping grounds in their districts should assist the War Office in this manner. The fields can be let to the War Office at a reasonable rate, and the corporation should keep the approaches in good condition. They might also make additional approaches and temporary roads.

Water Supply.—They may also assist very considerably in the matter of providing a water supply to the camp, and should keep at their depot a fairly large supply of 1-in., 1½-in., and 2-in. wrought-iron service pipes, and a number of standpipes and stopcocks. Each standpipe should be fitted with a stopcock, so as to prevent waste of water, and to facilitate repairs to the standpipe if damaged by horses. They should also have in stock a good supply of 3-in. cast-iron water main, and a number of hydrants, so that, should a supplementary supply of water be required to be carried to any particular part of the camping ground, there will be no delay in waiting for the pipes and fittings to arrive, but they will be ready for use. A good supply of 4-in., 6-in., and 9-in. sanitary pipes is also very useful, as is also disinfectant.

Maps.—The municipal engineer should have in his office, in duplicate, 6-in. Ordnance maps of the town and district, and a 1 in. to the mile Ordnance map, in duplicate, showing, not only the town and immediate neighbourhood, but the country around for a radius of about 8 miles. These maps would be of great service to the War Office in peace times in connection with their manœuvring arrangements.

Site for Camp.—He will have a knowledge of the geological features of the district, and this will be very useful when advising as to the selection of a site for a camp, the dryness of the ground being a very important matter, especially where a temporary hospital is to be located.

Present War.—As to the assistance the municipal engineer may render to the War Office during the present war, we may say that, in addition to the help suggested in the foregoing paragraphs, the municipal engineer should encourage his pupils to offer their services to the War Office, and he should see that the pupil, as far as his articles are concerned, does not suffer, but that the period for which he is away from his work be added to the three years or whatever the term may be, which is the time to which the pupilage extends. Two of my pupils have joined the Forces under similar conditions.

Staff.—He should encourage his staff to join the Forces, although their doing so may be inconvenient to him. If necessary, he should arrange for temporary assistants to take their place, and he should get a guarantee from the corporation that the positions held by the members of his staff shall be kept open for them until the War Office can liberate them. My council at Bridlington have decided to make up the salary of each official + 5 per cent bonus, and 10 per cent if married.

Workmen.—If permanent men, their places should be kept open for them while they are away at the war. The Bridlington Corporation are making up their wage + 10 per cent bonus to married men, and 5 per cent to single men.

Horses, Carts, &c.—If Territorials or other regiments are camping in the neighbourhood of the town, the corporation should assist them as far as possible by allowing them to use their horses, carts, rullies, and particularly covered sludge carts. No doubt the War Office will be willing to pay for the use of these, and it often happens that there is a scarcity of vehicles of this kind, or that the corporation alone possess vehicles that are suitable.

Hoisting Tackle.—Most corporations are fairly well supplied with hoisting tackle, and the loan of this may be of great service at the camp. A contractor's pump is also a very useful thing in camp, and the corporation would usually be in a position to lend one of these.

Watchmen's Huts.—The loan of these as sentry boxes may also be of use.

Scaffold Poles and Barrels.—These are always useful, and at the corporation depot there will usually be found a good assortment of such.

Sanitary Measures.—The corporation should carry out the sanitary measures in connection with camps, as they can do it more thoroughly than a contractor.

Weak Bridges.—The municipal engineer should make a careful inspection of the bridges in his district over which there is likely to be heavy traffic, and should see that any weak bridges are made safe.

Interference with Water Supply, Electricity, &c.—He should take every precaution to see that the supply

of water, electricity, gas, &c., to the town are not interfered with by spies.

Employment in Cases of Distress.—The municipal engineer should urge his authority to proceed with those works in which there is likely to be a maximum of labour. Road widenings, and road making generally, sewerage and similar works involve chiefly labour, and therefore are suitable, and these should be proceeded with in order to find employment in case of distress.

Assistance to Neighbouring Authority.—He should be prepared to offer his services, in an advisory capacity, to an adjoining authority, where the engineer may have gone to the Front, and has not a reliable deputy to leave in charge.

Ambulance Work.—He should encourage the employees to take up ambulance work, and in this connection he might allow them an occasional hour off to attend classes.

Aircraft.—When military or naval aircraft are visiting a town, the municipal engineer may be of great assistance in pointing out suitable places for the accommodation of same. If the visit is only a very temporary one (a matter of a few hours), he may assist by roping in the aeroplane, and instructing one of his employees to keep the public from interfering with it.

CONCLUSION.

I have endeavoured, in this lecture, to show that the duties of the municipal engineer are exceedingly important, and that they are becoming more so in consequence of recent legislation. I would conclude by saying that the municipal engineer, while he must have a thorough knowledge of his profession, must, above all else, be a man of tact. Unless he be a tactful man he will not succeed. His council will be composed of men in various stations of life, with different outlooks, ideas, political opinions, and religious beliefs, and only the man of tact can successfully serve them. If he is wise he will not parade his politics on every possible occasion. My last word, and this time to the student, is: Do well whatever you take in hand. Take as much pains over the trivial as the important, remembering that nothing is really trivial, and that the genius of success is nothing more than doing well whatever you do.

Tar-treated Roads in the North Riding.—The report of the Highways and Bridges Committee, which was submitted on Wednesday at the quarterly meeting of the North Riding of Yorkshire County Council, contained the statement that further complaints had been received as to the slippery state of some sections of tar-macadam on the main roads. The matter had again received careful consideration, and orders had been given for grit or sand to be distributed on the slippery surfaces when required.

ROAD MAINTENANCE IN WARWICKSHIRE.

The maintenance of the 457¼ miles of roads in the county of Warwickshire cost, in the last financial year, £122·8 per mile. In his annual report, Mr. John Willmot, the county surveyor, states that the average number of men employed on the roads, excluding those engaged on Road Board work, was 218. The cost of materials, including stonebreaking, was £19,047.

The quantity of granite and other hard stone purchased, exclusive of pebbles, was 31,509 tons, and the cost, including breaking, was £13,057, giving an average price of 8s. 3d. per ton. The quantity of tarred material used, exclusive of that put down under contract, was 1,920 tons, one-half of which was used for patching purposes. The average price of this material was 12s. 3d. per ton. For strengthening the sides of the roads, and putting in foundations where required, 13,898 tons of slag and 561 tons of rubble have been used. The average price of the former was 5s. 3d., and of the latter 5s. per ton. The railway rates have all been increased, and in Warwickshire the effect of this increase has been to add about 1½d. per ton on the material all round as compared with the rates paid in the previous year.

TEAM LABOUR.

The quantity of material hauled by piecework on to the roads from the various wharves, railway stations and quarries was 57,158 tons, at a cost of £4,569, which is equal to a rate of 1s. 7d. per ton. The average cost per ton per mile was 7·7d., as against 7·5d. for the previous year.

Mr. Willmot points out that the difficulty of obtaining an efficient supply of horses and carts for this work increases each year. During last year steam tractors were used to a limited extent where large quantities of material had to be drawn from one station. The tractors are, he states, more serviceable, but the cost was no less. The council recently purchased a combined steam roller and tractor. So far this has been used chiefly for hauling purposes, and has proved exceedingly useful, and Mr. Willmot hopes in his next report to furnish some information as to the cost of working.

SURFACE TARRING.

The surface tarring was, on the whole, carried out under favourable conditions as regards the weather, and a much larger area was treated than in previous years. About 60 per cent of the work was done by contract, and the remainder by the council's own men. The work cost £4,636, and the area treated was 829,628 sq. yds., equal to about 90 miles of road in length, or one-fifth of the total mileage directly maintained by the council.

There is very little difference in the cost per square yard of the work done by contract and that done by the council's own men, the latter being ·11d. cheaper than the former. There is, however, in the opinion of the county surveyor, not the slightest doubt that the work done by the council's men was much the better, and the results more lasting.

ROAD BOARD SCHEME.

This scheme provides for strengthening the foundations, where required, and surfacing with tarred material slightly over 40 miles of road at an estimated expenditure of £76,450. Good progress has been made with the work. The council's own men are doing all the strengthening and foundation work necessary, and after this has been done the roads are being surfaced with Tarmac, by Tarmac Limited, at contract prices. At the end of the financial year, about 20 per cent of the work had been done.

Council Chairman and Steam Rollers.—At the last meeting of Newmarket Urban District Council a committee stated that they had considered a further report from the surveyor upon the question of the purchase of a steam roller, and had resolved to recommend that the council advertise in THE SURVEYOR newspaper asking for quotations; and that a specification of a suitable roller be prepared, tenders to be invited upon it. The surveyor was authorised to inspect certain road rollers at work in various districts. Mr. Hambling asked whether the council wanted to have the specification before them. The chairman: It is a technical matter. We had better leave it to the surveyor, I think. Mr. Hambling referred to the type of roller to be selected. The chairman: That is a question for experts, which we are not. The clause (states the *Newmarket Journal*) was adopted.

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain.
Each man's opinion freely is his own
Concerning anything, or anybody.
MASSINGER "The Fatal Dowry," Act II., 2

THE TRAINING OF MUNICIPAL ENGINEERS.

To the Editor of THE SURVEYOR

SIR,—The [illegible] Mr. Platt's remarks in the "Report of the Special Committee on the Practical Training of [illegible] to the Institution of Civil Engineers."

I [illegible] with Mr. Platt [illegible] teach, and their offices are not worth bothering about," [illegible] that it would be better [illegible] a pupil to go to some detestable [illegible] pupils are not always [illegible] Mr. Platt's words quoted [illegible] the possession of the distinction M.Inst.C.E. [illegible] indefinite distinction than in any other [illegible] letters to the alphabet.

Mr. Platt seems to think that the evils of the pupil system are only rampant in the small districts (p. 28), and the writer also casts suspicions of the "small" man (p. 30). I would recommend to them Mr. Brodie's epigrammatic reply: "A man doing small work, if he is doing it well, is often a good man." I may say at once that my work is at present in a small district, and no doubt Mr. Platt, from his lofty pinnacle, would have a difficulty in descrying it with a powerful [illegible], but, nevertheless, "small" is a comparative term; there are orders of smallness, and my district is, in fact, larger in proportion to Mr. Platt's [illegible] than his is in proportion to Mr. Brodie's. It might even have occurred to Mr. Brodie and to Sir M. Fitzmaurice that so important a work as [illegible] engineer of Rochdale was somewhat of a small order, though evidently this point of view [illegible] to Mr. Platt. It must be borne in mind, however, that the majority of municipal engineers are concerned, on the whole, with small things, and it is the daily routine, which is the most important, and not the larger but less frequent special works, though these bulk more largely in an account of the municipal work of a district. In his opinion, and, I venture to say, in the opinion of many other surveyors who have had experience of both, large and small districts, the best training for a municipal engineer is to be obtained in a town of 20,000 to 50,000 inhabitants. In such a town the supervision of the town council and the general public is so close, and any increased expenditure has such an immediate effect on the rates, that the well-known definition of an engineer [illegible] one who can do for 1d. what any fool can do for 2d. is the usual standard by which to test the municipal engineer; whereas in a large town, where things are more under the control of the officials and the chairmen of committees, and things are done in a more hole-and-corner manner, the engineer can [illegible] on occasion fool away two or three thousand pounds almost unnoticed. Efficiency, economy, attention to detail, correct and systematic records of work [illegible] can be and are as well practised in a small town as a large one, and in a small town the pupil has a chance of grasping the entire scheme of things, and thus fitting himself for taking charge of a district, whereas in a large town he becomes a mere cog in the wheel, and has a grasp only of his own special department.

My experience of the pupil system in a large town of a population of upwards of 100,000 may interest you. The borough engineer was allowed to take two pupils. They usually came on a three years' agreement at a premium of 150 guineas, so that one finished(!) pupil was turned out every eighteen months, and the engineer was 100 guineas a year in pocket. This was not a "small" district, where the engineer was underpaid, and had to eke out his salary by premiums, as is so often suggested is the case in a small district, but a place where the office was well staffed and the borough engineer well paid. The only preliminary qualification of the intending pupil was the possession of the "dust," and this having been planked down, the pupil was turned loose in the office to shift for himself. Of the number who passed through the office while I was there, one was a B.Sc. and public school man, and an unmitigated nuisance, who would neither work himself nor let anybody else work; another was the son of wealthy parents, who, except for being without the B.Sc. degree, was not much different to the first-mentioned, while another might not have been made into an engineer in a financial sense.

As to whether the training received and the prospects opened up are worth paying a premium for [illegible] the writer does. The weakness of the pupil system is stressed by Dr. Unwin's remarks on p. 28: "Some of the ablest lads we have to deal with are lads who cannot pay a premium. . . . It is a serious thing if the ablest young men cannot get practical engineering training."

In conclusion, though it may be accounted heresy to say so, I think the possession of the certificate of the Institution of Municipal and County Engineers ought to carry more weight with municipal engineers than the possession of the Assoc.M.Inst.C.E. qualification, as the Municipal and County Engineers' examination is for them an infinitely better test than the Assoc.M.Inst.C.E. examination. I think the Institution of Municipal and County Engineers would do their profession more good by putting all their energies into raising the status of their institution rather than being content to allow it to remain an understudy to the Institution of Civil Engineers.—Yours, &c.,

A "SMALL" CORPORATE MEMBER.

London,
October 26, 1914.

BRITISH FIRMS.

To the Editor of THE SURVEYOR

SIR,—We enclose herewith particulars regarding Messrs. Dussek Brothers & Co., Limited, and ourselves, and perhaps you will kindly publish this information in your columns:—

MESSRS. DUSSEK BROTHERS & CO., LTD.

1857—Business founded by A. L. Dussek, British subject, born in London.

1889—Transferred to Dussek Brothers & Co. Partners: A. S. Dussek, A. L. Dussek (sons of the founder) and J. Webster, all British subjects born in London.

1905—Converted to private limited company. Directors: A. S. Dussek and Colonel H. A. Christmas. The whole of the capital is held by British subjects. All employees are British subjects.

THE DUSSEK BITUMEN COMPANY.

1904—Founded by A. E. H. Dussek and A. S. Dussek (director of Messrs. Dussek Brothers & Co., Limited). All the capital is held by the above two partners, and employees are British subjects.

Colonel H. A. Christmas is now serving his country. E. A. Dussek is with Lord Kitchener's Army, and A. S. Dussek (ex-naval volunteer), A. E. H. Dussek and L. A. Dussek are training in volunteer forces.

Yours, &c.,

THE DUSSEK BITUMEN COMPANY.

Canal Bank,
Deptford, S.E.
October 23, 1914.

CAMP SANITATION.

To the Editor of THE SURVEYOR.

SIR,—I have read with considerable interest Mr. Hartfree's article on "Camp Sanitation" in your last issue. Such an article appears at a very opportune moment, as no doubt many surveyors in this country have now to take charge of concentration camps, as well as to advise the military authorities on many sanitary questions. I trust that any of your readers who have any special knowledge of camp sanitation will favour us with their views.

Would it be possible also to obtain from some of the surveyors or assistants who have joined Kitchener's Army some account of their experiences? There must be many men with a practical knowledge of sanitation either serving at the front, or in camp in this country, or in barracks or billets. It would be of the greatest public value if these men could furnish us, through the medium of your largely read paper, with some of their experiences, their criticisms and suggestions for improvements. It may be difficult to communicate with them, but if this letter is seen by any of their friends it would be of public service if they could be written to upon the subject.—Yours, &c.,

H. PERCY BOULNOIS, M.INST.C.E.

7 Victoria-street, S.W.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

433. Mechanics. Show how to find the periodic time of the compound vibration in a case of simple harmonic motion, and give a proof of the necessary formula.

434. A Question in Statics. A light rod, of length 3 ft., whose weight is neglected, has equal weights attached to it, one at 9 in. from one end and the other at 15 in. from the other end. If it be supported by two vertical strings attached to its ends, and if the strings cannot support a tension greater than the weight of 1 cwt., what is the greatest magnitude of the equal weights? (H. P. M., *Penryn.*)

435. Damp Prevention.—Show by sketches three methods of preventing moisture in the soil from rising into a brick wall: (*a*) an ordinary 14-in. wall, (*b*) a 16-in. cavity wall, (*c*) an 18-in. basement wall.

436. Ventilation.—What effect has (*a*) the breathing of animals and (*b*) the combustion of fuel upon the purity of the atmosphere? (T. R.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

430. Materials. In what respects do Portland and Roman cements differ, and in what circumstances is the latter used? ("Beginner.")

Portland cement may be termed a composite cement, and Roman cement a natural cement. The former contains roughly 60 per cent lime, 20 per cent silica, 5 to 10 per cent alumina, and small quantities of various alkalies, oxides, &c. It is prepared by combining limestone rock and slag in a battery of washmills, warm water being added, forming what is known as slurry. The substance is then tested and screened, being afterwards conveyed to tanks provided with mechanical stirrers. It is then burnt in a rotary kiln, and passes to a rotary cooler in the form of clinker. This clinker is then crushed and passed successively through various mills until the required degree of fineness is obtained. There are three distinct types of Portland cement—"quick-setting," which sets in from ten to thirty minutes, "medium-setting," taking from thirty minutes to two hours, and "slow setting," which occupies from two to seven hours in the process. Roman cement is prepared by calcining at a low temperature nodules found in the London clay and in the shale beds of the lias formation. It contains 40 per cent of clay, and is a rich brown in colour. Whereas Portland cement weighs about 112 lb. per bushel, Roman cement only weighs 75 lb. It has many disadvantages, being only one-third the strength of Portland cement, and having to be kept in barrels. If it is exposed to the atmosphere it becomes inert. It sets rapidly—in about fifteen minutes—and was largely used for tidal works, where rapidity of setting was very important; but lately it has been almost entirely superseded by the "quick-setting" Portland cement. (P. H., *Middleton.*)

Cements are either natural or artificial. Roman cement is the best-known natural cement in this country. It is made by burning nodules containing some 30 to 45 per cent of clay, found in the London clay. Portland cement is an artificial compound made by mixing chalk and clay in water in the proportion of about 3 parts of chalk to 1 part of clay. The mixture is then dried and burnt in kilns, the resulting clinker being ground extremely fine, so that 90 per cent of it will pass a sieve having 2,500 meshes to the square inch. The weight of Roman cement is about 75 lb. per bushel, that of Portland cement being about 115 lb. per bushel. They differ very much in colour, Roman cement having a rich brown colour, while Portland cement presents a greenish-grey colour. Roman cement sets in about fifteen minutes, but its ultimate strength is very small. It should never be exposed to the atmosphere, as it absorbs carbonic acid (CO_2) with ease, and thus becomes useless. Portland cement, on the other hand, must be thoroughly cool when used—all the lime in it thoroughly air-slaked—otherwise it may swell in the work when finished and cause much damage. In order to cool it, it should be spread out on a floor protected from the weather, and turned over daily for some weeks, so that every part of it may become thoroughly air-slaked. It will set either in the air or under water, becoming hard in twenty-four hours, attaining considerable tensile strength in seven days, and in course of time a strength far greater than that of any other cement. A good cement, after setting seven days under water, is expected not to break under a less stress than 355 lb. per square inch. Previous to the introduction of rapid-setting Portland cements, Roman cement was largely used for tidal work, and other work where rapidity of setting is necessary. It is, however, rarely used for such work now. Roman cement is also used for stucco and plasterers' work in general, where great strength is not needed. It is not used for mortar or concrete. (T. W. P., *Bexhill-on-Sea.*)

These two cements differ in colour; Portland cement has a greenish-grey colour, and Roman cement has a rich red-brown colour. Roman cement sets very rapidly, due to the presence in high percentage, of alumina, and is only one-third the strength of Portland cement; it is much weakened by the addition of sand, which should never be used in a greater proportion than 1 to 1. Roman cement, on exposure to the atmosphere, absorbs carbonic acid and becomes useless; Portland cement, on the contrary, improves by being exposed to the air before being used, as the particles of free lime are rendered inert, while the setting quality of the cement itself is not affected. Roman cement is chiefly used for tidal and other work, where rapidity of setting is a necessity; but since the introduction of the more rapid-setting Portland cements, the use of Roman cement has been almost entirely superseded. (W. D., *Dudley.*)

431. Water Supply.—Explain the difference between surface springs and deep springs, and state the geological conditions in which each occur.

The original source of all available water supply is rainfall. Of the whole rainfall, part evaporates into the air, part percolates by surface drainage and forms rivers, and part sinks into the ground and forms the underground supply. The underground supplies are known as springs, and these

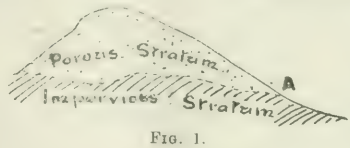

FIG. 1.

may be divided into two classes—viz., surface springs and deep springs. Surface Springs.—The rain falling on the ground will percolate downwards until it is stopped by an impervious stratum of the earth. It will then issue from the ground at the lowest point of the porous stratum. This is an instance of a surface spring. The sketch shows a

section of a hill where such a spring might exist, with the outlet shown at A. Deep Springs or Deep-seated Springs as they are sometimes called. Fig. 2 shows an example of a [illegible]

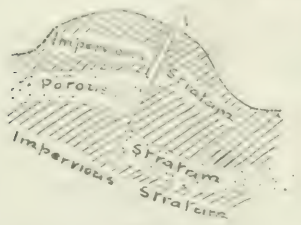

Fig. 2.

spring. Owing to a "fault" in the structure, the water is prevented from percolating downwards, and so finds an outlet upwards at the point A. Another

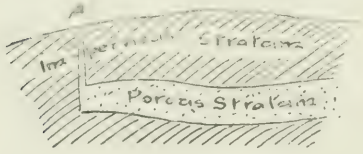

Fig. 3.

example is shown in Fig. 3, where the water, finding no natural outlet, issues upwards through some weak point in the stratum at A. (G. W. C.)

INSTITUTION OF CIVIL ENGINEERS.

AWARDS FOR PAPERS.

In addition to the awards announced in April, for papers read at the meetings, the council of the Institution of Civil Engineers have made the following awards for papers published in the "Proceedings" without discussion during the session 1913-1914:—

A Telford Gold Medal to Mr. J. V. Davies (New York); Telford Premiums to Messrs. W. C. Popplewell (Manchester), A. J. Knowles (Cairo), H. Gaskell, junr. (Widnes), P. Rothera (Trichinopoly); the Crampton Prize to Mr. H. F. Carew-Gibson (London), and the Manby Premium to Mr. W. M. Griffith (Bareilly, India). The Webb Prize for the best paper on railway machinery published during the past three years has been awarded to Mr. Henry Fowler (Derby), and the Indian Premium for 1914 to Mr. P. Rothera (Trichinopoly).

The council have made the following awards in respect of students' papers read during the session 1913-1914: The "James Forrest" Medal and a Miller Prize to Mr. J. E. Swindlehurst (Birmingham), and Miller Prizes to Messrs. T. C. Grisenthwaite (Glasgow), H. J. C. Harper (Bristol), W. P. Nevett (Birmingham), J. M. L. Bogle (Manchester), E. A. Cross (Birmingham), S. Brassey-Edwards (Manchester), G. T. Cotterell (Bristol), D. D. Stanier (Newcastle), W. E. Gurry (London), H. Taylor (Birmingham) and R. C. Rattray (Manchester).

Fire Precautions for Belgian Refugees.—The British Fire Prevention Committee has issued a special fire warning for buildings in which Belgian refugees are being temporarily housed. This fire warning is obtainable not only in the English language, but in French and Flemish translations. The dangers of matches, candles, oil lamps, spirit cookers, smoking, celluloid and so forth are pointed out in concise language, and, having regard to the fact that many of the refugees are neither used to the open fires or ranges customary in England, nor to gas lighting and electric lighting, these fire preventive hints, if suitably displayed at the various hostels and homes, should be eminently useful to them. Copies of the warning can be obtained upon written application (giving requirements as to language) addressed to the Registrar, The British Fire Prevention Committee, 8 Waterlooplace, London, S.W.

PRO PATRIA.

[EIGHTH LIST.]

We present herewith an eighth list of municipal engineering and sanitary officials who are taking part in the war, and shall be glad to hear of other cases within the knowledge of our readers.

Bone, Hugh, assistant in the borough engineer's department, Falmouth, the Engineering Unit, R.N.D., Oxford Eastern Camp, Ringwould.

Bullock, Sydney, notice clerk, private street works department, Stoke-on-Trent Corporation, B Squad., Staffordshire Yeomanry.

Clough, Edgar, assistant in the borough engineer's department, Wigan, 5th Battalion, Manchester Regiment (Territorials). Now on foreign service in Egypt.

Fox, F. St. G. J., assistant city surveyor, Lichfield, 3rd Battalion, Birmingham Regiment (Kitchener's Army).

Higgins, D., assistant surveyor, East and West Molesey, Sportsmen's Battalion, Royal Fusiliers (Lord Kitchener's Army).

Hossack, W. B., assistant road surveyor, Middle Ward District, County of Lanark, 2nd Lieutenant, Lowland Divisional Royal Engineers (Territorials).

Lines, G. W., clerk, borough engineer and surveyor's department, Fulham, 9th Lancers (Lord Kitchener's Army).

Locker, A. B., accounts clerk, Stoke-on-Trent Corporation, Northumberland Fusiliers (Reservist).

Richards, J. M., engineering assistant to the Abersychan Urban District Council, London Sanitary Section of the Royal Army Medical Corps.

Snell, C., deputy surveyor to the Abersychan Urban District Council, London Sanitary Section of the Royal Army Medical Corps.

Twentyman, Edward, pupil of Mr. H. C. Marks, city engineer and surveyor, Carlisle, Engineering Societies Battalion, R.N.R.

Yarker, Alfred F., assistant clerk in city engineer and surveyor's department, Carlisle, trooper, Westmorland and Cumberland Yeomanry.

Mr. Alec Ernest Dixon, of the borough engineer's department, Southampton, has been gazetted lieutenant-commander in the Royal Naval Volunteer Reserve, and is in command of a well-equipped, speedy motor boat which he has placed at the disposal of the authorities for despatch carrying and scouting.

The Manchester School of Technology possesses particulars of more than 550 students who were in attendance at the college during the academic year 1913-14, and who are now serving in various branches of His Majesty's Forces. With a view to the completion of a Roll of Honour, which shall also include the names of past students engaged upon military service, the Registrar will be glad to receive any information from such persons themselves or from their relatives or friends.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

Nottingham a Port. Nottingham Corporation by a large majority on Tuesday decided to proceed with important works, towards the cost of which the Development Commissioners have promised an advance of £50,000, the ratepayers contributing £100,000. The scheme is to improve the navigation of the river Trent between Nottingham and Newark, and it was urged the effect of the proposal would be to make Nottingham an important inland port. Employment would be given to many unemployed by the scheme.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Dunfermline T.C. (October 2nd. Mr. J. C. Pitman).—This was an application for a provisional Order with the object of the purchasing undertaking having the authority to provide an improved water supply to the burgh. The cost of the proposed scheme, which includes the laying of a main pipe between Glenquey and Glensherrup, is estimated to amount to £[illegible], the enlargement of the storage capacity at Craigluscar, and the construction of a filtering bank [illegible] £75,000. Mr. [illegible], town clerk, stated that the town council had agreed to withdraw that part of the Order relating to the construction of a third reservoir at Craigluscar, and pointed out that the council had not intended to proceed with that work for at least ten years. They would only require the additional storage which Rosyth has yet to be developed that they would need extra storage to ensure a two days' supply for the community.

Evesham R.D.C. (October 23rd. Mr. M. K. North).—£2,500 for works of water supply for the parish of Harvington.—Mr. Wadams, the clerk, stated that the application was for an extension to the scheme for villages water supply already carried out by the Evesham and Pebworth Joint Water Committee. The scheme was explained by Mr. J. E. Willcox (Messrs. Willcox & Raikes), who said the water would be obtained from Littleton reservoir, which is supplied by springs on the Cotswold Hills, a distance of some 14 miles away, other villages [illegible] already supplied.

St. Columb R.D.C. (October 22nd. Mr. R. G. Hetherington).—£210 for the purchase of a site for the erection of working-class dwellings and £350 for the drainage of Atlantic-terrace, Trevone Bay.—Evidence was given of the demand for cottages. With respect to the second application, strong opposition was offered by [illegible] and property owners. It was alleged that the scheme is inadequate.

Settle R.D.C. (October 20th. Mr. F. O. Stanford). £900 for sewage [illegible] Ingleton. The extension of the sewerage is necessitated by the development of the new colliery village. Plans have been passed for 108 cottages, and they are now in course of erection. It was stated that the matter was so urgent that the work had been commenced before application had been made to borrow the money.

Wallasey T.C. (October 26th. Mr. Courtenay Clifton).—£11,546 for the erection of thirty-two dwelling-houses and eighteen cottage flats on land between Poulton-road and Lowe-lane, Poulton.—The town clerk, Mr. H. W. Cook, stated that rehousing operations became necessary owing to certain demolitions during the extension of the Wallasey tramways, and at a future date the corporation expected to be in a position to submit a further representation to the board with regard to 51,912 sq. yds. of land purchased for allotment gardens, recreation grounds, and housing. The estimated nett receipt from rent was £866 6s. 6d., while the estimated expenditure for all purposes was £6 12s. 7d. less than that sum. There was thus an estimated balance of receipts over expenditure of £6 12s. 7d. per annum. The rents of the houses ranged from 6s. 10d. to 8s. a week, and of the cottage flats from 4s. 2d. to 6s. 6d.

APPLICATIONS FOR LOANS.

Buxton U.D.C.—£2,335 for the purposes of electricity.

Coventry T.C.—£2,025 for a rehousing scheme, and £4,915 for sanitary conveniences.

Ilfracombe U.D.C. £927 for making up a road.

Kidderminster T.C.—£31,000 for works of sewage disposal.

Leek U.D.C.—£3,660 for laying out Brough Park.

Listowel R.D.C.—£7,600 for works of road improvement.

Ostwaldwistle U.D.C.—£1,550 for street improvement schemes.

Ramsgate T.C.—£526 for road widenings.

Rothwell U.D.C.—£2,100 for works of water supply.

St. Germans R.D.C.—£950 for sewage works at Crafthole.

St. Ives (Cornwall) T.C.—£1,188 for road improvement.

Southall U.D.C.—£13,250 for workmen's dwellings.

Southend T.C.—£1,800 for surface-water drainage.

Twickenham U.D.C.—£6,240 for road improvement.

Tynemouth T.C.—£6,025 for repaving works.

Wem R.D.C.—£2,000 for works of water supply.

Yarmouth T.C.—£6,280 for schemes of improvement.

LOANS SANCTIONED.

Chesterton R.D.C.—£650 for the erection of workmen's houses.

Dewsbury T.C.—£3,100 for the purchase of Earlsheaton Hall estate for public walks and pleasure grounds.

Godalming T.C. £2,000 for under-draining at the sewage farm.

Hemel Hempstead R.D.C.—£3,790 for a housing scheme.

Orsett R.D.C.—£14,520 for the South Ockendon sewage disposal scheme.

Pebworth R.D.C.—£196, additional loan for the Honeybourne housing scheme.

Reading T.C.—£6,750 for road improvement.

Rowley Regis U.D.C.—£3,098 for laying out a cemetery.

Tendring R.D.C.—£1,500 for water supply works.

Wath R.D.C.—£938 towards the cost of hospital extension.

Withernsea U.D.C.—£2,500 for water main extensions.

A Glossary of Road Terms (By H. Percy Boulnois, M.Inst.C.E., St. Bride's Press, Limited, 24 Bride-lane, E.C., Price 2s. nett).—The movement towards standardising the principal roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road terms in use in different districts, and Mr. Boulnois has compiled a glossary with the hope that it may form a basis for such a correlation.—*Times Engineering Supplement.*

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below: Buildings, Liverpool, Tynemouth; housing and town planning; Leeds; roads and materials—Belmont, Cowes, Ealing, Esquesbourne, Bromley, Cannock, Lewisham, Southwark; sewerage and sewage disposal—Banbury, Colwyn Bay, Kidderminster; water, gas and electricity, Perth. Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

ADMINISTRATION.

Down C.C.—The county surveyor, Mr. James Heron, has submitted to the Proposals Committee a report on the duties and salaries of the assistant surveyors, in which he lays emphasis upon the necessity for the proper supervision of the work of these officers since the introduction of the motor traffic. He adds that further inspections of the roads should be made, and concludes: "I reckon that to make these inspections would, on the average, entail each assistant surveyor travelling at the very least 5,308 miles in the year, but probably considerably more, not including the mileage for special inspections. That is, the mileage which it is now necessary to travel is at least double what it formerly was, and the duties to be performed are correspondingly increased. All the assistant surveyors have provided themselves with motor vehicles, either cars or cycles. Without these it would be impossible to carry out the work. I am, for the reasons given above, of opinion that the salary fixed in 1899, beginning at £120 per annum, to include travelling expenses, is now inadequate." The Proposals Committee have recommended that the Local Government Board be requested to issue an order amending the conditions under which the assistant surveyors were engaged, so as to reduce the number from twelve to eight, making them whole-time officers, or to such number as the county surveyor considered adequate.

Glastonbury T.C.—The duties of the borough surveyor, Mr. G. Alves, were the subject of a report by the Finance Committee recently. The committee considered that much of the borough surveyor's time was taken up with work which could be performed by a junior clerk, and that he worked much overtime and was unable to keep on applications being made to him in business hours owing to his having no separate office. The further consideration of the best method of meeting the difficulty was deferred.

BUILDINGS.

Coventry T.C.—The General Works Committee recommend the erection of public conveniences, at an estimated cost of £1,915.

Devonport T.C.—The Parks Committee have submitted to the council a recommendation for building a bandstand at Alexandra Park at an estimated cost of £300.

Liverpool T.C.—Plans have been prepared of the proposed baths at Pierhead. The scheme is estimated to cost £70,000.

Manchester T.C.—The Parks and Cemeteries Committee propose to erect, at a cost of £450, a wooden building for the social and recreative life of the soldiers in training at Heaton Park.

Portsmouth T.C.—The borough engineer, Mr. A. W. Ward, has been instructed to prepare an estimate of the cost of making a concrete sea wall along the Stamshaw front.

Taunton T.C.—A decision has been reached to purchase a site for £450 for the purpose of a swimming bath, at an estimated cost of £2,550. The scheme of the borough surveyor, Mr. D. Edwards, is to build a swimming pond 95 ft. by 36 ft., and to provide six or eight washing baths, and other necessary accommodation.

Tynemouth T.C.—The council have adopted the plans of the borough surveyor, Mr. J. F. Smillie, for an isolation hospital, estimated to cost £30,000, and a sanatorium, estimated to cost £2,700.

Yarmouth T.C.—In an amendment of the plans for the public baths, it has been agreed that the shelters on the south, north and west sides should be supported on granite columns, and that the basin should be built in concrete, waterproofed with asphalt, and lined with glazed tiles. The borough surveyor, Mr. J. W. Cockrill, estimates the extra work in connection with the construction of walls and shelters would increase his original estimate of £3,300 by the sum of £640, making a total of £4,140, at which £2,400 would approximately be spent in labour.

HOUSING AND TOWN PLANNING.

Belfast T.C.—It was reported at the council meeting recently that the Local Government Board had given their sanction to the loan for the erection of working-class lodging-houses, the repayment to be spread over a period of sixty years.

Dungannon R.D.C.—Steps are being taken to promote a housing scheme, and the services of Mr. C. Newell have been retained as architect.

Essex C.C.—The Highways Committee were recently authorised to erect up to fifteen pairs of cottages for roadmen, under such provisional arrangements as should ensure the rents being sufficient to meet the instalments of principal and interest on loans and other outgoings. It was thought that loans at a comparatively low rate of interest might be obtained from Government funds, and the county architect estimated the cost of the cottages would be £304 or £354 a pair. Replying to a member, Councillor Dent said that, as at present advised, they could only borrow for thirty years, and at that period he was afraid they could not build on an economic basis. This report was only preliminary.

Shoreditch B.C.—The question of a housing scheme has been referred to the Housing Committee.

PARKS AND OPEN SPACES.

Barrow T.C.—The Local Government Board have sanctioned the purchase of Cellfachan Farm for the purpose of public pleasure grounds. The price was £2,300.

Leek U.D.C.—The council have approved an estimate (£3,660) of the surveyor, Mr. W. E. Beacham, of the cost of laying out Brough Park in accordance with plans already approved by the council, including the provision of a bandstand, pavilion shelter and bowling green.

ROADS AND MATERIALS.

Beckenham U.D.C.—It has been resolved to carry out a number of road improvements at a total estimated cost of £2,120, and to apply for grants in aid of the work from the Road Board and the Local Government Board.

Bethnal Green B.C.—Paving works are to be carried out in Hackney-road and Grove-road, at an estimated cost of £5,567.

Bolton T.C.—The following schemes of improvement have been agreed to: Hulton-lane, £9,966; Plodder-lane, £12,443; and Church-road, Smithills, £6,100.

Bootle (Cumberland) R.D.C.—The surveyor, Mr. D. R. Dawson, has submitted the plans and estimates for improvements to the main road which passes through the district. Altogether, over 11 miles of main road are to be altered, corners removed, and the whole macadamised, the estimated cost being £10,895.

Bradford T.C.—The Street, Drainage, and Works Committee propose to repave part of Thornton-road with granite setts, at an estimated cost of £2,475.

Bromley T.C.—It is announced that the Road Board have sanctioned a grant of £2,640 for wood paving.

Chapel-en-le-Frith R.D.C.—The question is under consideration of constructing a new road from Bugsworth to Bridgemont.

Coventry T.C.—A new road is to be constructed across Gosford Green, from Folly-lane to Binley-road.

Crieff T.C.—It has been agreed to carry out tar-painting at an estimated cost of £608.

Croydon T.C.—It has been decided to proceed as soon as possible with the construction of the relief road from Thornton Heath to Purley. The work will

be done by direct labour, and the estimated cost is £75,943.

Elgin C.C.—A decision has been reached to proceed with the scheme of improvement on the Dulsan, Bridge, Grantown, and Dyvercad at an estimated cost of £1,900.

Essex C.C.—The Highways Committee have been authorised to carry out the following works: Epping New-road, Woodford Urban District Council boundary to the Robin Hood public-house, £8,000, and Robin Hood to the Wake Arms, £2,300, these two sections providing work for 300 men for four months; Barking to Grays road widening, £1,600, thirty men for four months; Sockett Heath widening, Little Thurrock, £1,000, twenty men for three months; Painter's-hill, Vange new road, £1,500, thirty men for three months.

Falmouth T.C.—The borough surveyor, Mr. J. S. Walton, has received instructions to prepare plans of a widening in Prince-street.

Hitchin R.D.C.—A scheme for widening Dunham's Lane is to be carried out at an estimated cost of £382.

Lewisham B.C.—The Road Board have provisionally approved the schemes of road improvement submitted by the borough surveyor, Mr. E. van Putten, and have been informed, in reply to their request, that the most urgent of the works were the wood paving at the Lee Green end of Eltham-road, the Burnt Ash-lane improvement, and the wood paving at the west end of Brownhill-road.

Limerick T.C.—A scheme has been adopted for asphalt and other paving works estimated to cost £40,000.

Lowestoft T.C.—The Road Board have given their sanction to the council proceeding with the scheme of road improvement already approved by the council and have consented to make a grant to cover the amount of interest payable on the loan required. The Local Government Board have sanctioned the borrowing by the council of the sum of £10,900 for resurfacing roads, repayable in five years, and £2,200 for kerbing and channelling, repayable in fifteen years.

Mytholmroyd U.D.C.—Schemes of road widening estimated to cost £2,416, have been approved by the council.

Pickering R.D.C.—The surveyor, Mr. S. Russell, has obtained the consent of the council to the hiring of another steam roller in order to expedite the work of putting on the roads 1,000 tons of material.

Ramsgate T.C.—It has been agreed to carry out the widening of Shah-place and Ellington Park-road, at an estimated cost of £526.

Riccall R.D.C.—The road surveyor, Mr. A. Douglas, has received instructions to prepare an estimate for the Road Board of road improvements near Selby on roads which are likely to be subject to heavy traffic in connection with camp and training areas.

South Shields T.C.—A scheme of diversion is to be carried out in Team-lane-road, at an estimated cost of £8,970.

Southwark B.C.—With a view to providing work for the unemployed, the borough engineer, Mr. Arthur Harrison, approached the Road Board with a proposal that, in the event of the board agreeing to pay the cost of asphalting certain roads set out in the scheme, amounting to £11,579, the borough council would be prepared to carry out the asphalting of additional streets at a cost of £7,721, thus putting in hand works of a productive character to the extent of £19,301. The Road Board have now written intimating that they are prepared to agree to the proposal submitted to them, and the borough engineer has received the thanks of the council for his efforts.

Tynemouth T.C.—Among the schemes projected are the making of a road between the north end of Preston North-road and Mast-lane, Cullercoats, and the widening and diversion of the Blyth and Shields road between Holy Saviour's Church, Tynemouth, and Mast-lane. The two latter schemes are estimated to cost £6,000 and £7,000 respectively.

Whickham U.D.C.—It is proposed to carry out road improvements at an estimated cost of £1,000.

Yarmouth T.C.—The borough surveyor, Mr. J. W. Cockrill, has reported to the council that, owing to the war, there were certain road materials which could not be obtained, consequently the road-making programme for the year could not be carried out.

SEWERAGE AND SEWAGE DISPOSAL.

Banbury T.C.—The tender of Messrs. T. Vale & Sons, of Stourport, at £16,861, has been accepted for the sewerage and sewage disposal scheme.

Beeston U.D.C.—An order has been placed with Ames-Crosta Sanitary Engineering Company, Limited, of Nottingham, to supply one of their patent "Simplex" rotary sprinklers, 98 ft. diameter.

Burton T.C.—It is proposed to carry out sewerage extensions at an estimated cost of £1,620.

Colwyn Bay U.D.C.—The council have adopted the scheme of sewerage and sewage disposal for Mochdre prepared by Mr. Robert Green, M.INST.C.E. (Birmingham), which provides for the pumping of the sewage and its discharge into the sea. The scheme has been submitted to the Local Government Board, with an application for permission to borrow £11,000 to meet the cost.

Coventry T.C.—The council are recommended by the General Works Committee to carry out sewerage works at Stoke Park, at an estimated cost of £1,534. An expenditure of £1,200 is also advised in connection with the sewage disposal works.

Helston R.D.C.—It has been decided to construct a septic tank at Ruan Minor in connection with the drainage of certain parts of the village.

Kidderminster T.C.—At a meeting last week the scheme of sewerage and sewage disposal for districts recently added to the borough, prepared by Messrs. Willcox & Raikes, was duly approved, and it was decided to make an application at once to the Local Government Board for sanction to a loan of £31,000 for the works, which include sewering certain portions of the district, pumping plant, storm-water and sedimentation tanks, and laying out a considerable area of land as a sewage farm. It is intended to proceed with the works without delay.

Manchester T.C.—The Rivers Committee have under consideration proposals for undertaking certain main drainage works, so as to relieve or prevent unemployment in the city during the winter months. The committee have a number of men well skilled in drainage works whose employment is about to cease, and they wish to retain their services. They have, therefore, appealed to the Finance Committee to consider the matter, and report to the city council as to its financial aspect. The proposed works are needed, but they would not in ordinary circumstances have been undertaken just now.

Oxford T.C.—Owing to complaints by the Thames Conservators, the council have under consideration the question of improvements at the Chipping Norton sewage disposal works. The conservators insist upon the work being carried out immediately, and the council have appealed to the Local Government Board for a postponement.

Penybont R.D.C.—The council have decided to proceed with the Pencoed sewerage and sewage disposal scheme which was prepared by Mr. T. J. Moss-Flower, of Westminster and Bristol. The Local Government Board have approved of the scheme, and tenders are to be invited immediately. The proposed works include the construction of about 5 miles of sewers, with railway and stream crossings, detritus, balancing, sedimentation, humus, storm, and other tanks, percolating filters, sludge and filter beds, engine-house, engines, pumps, pump well, and other contingent works.

Rugby R.D.C.—The council have approved of schemes of sewage disposal for the villages of Clifton and Vicarage Hill. With respect to Newbold-on-Avon the surveyor, Mr. T. W. Willard, has submitted a modified scheme dealing with the upper part of the village by gravitation, at an estimated cost of £2,000, and this has been referred to the parish council.

Wakefield T.C.—The council have agreed to receive the sewage of a certain part of Stanley urban area on payment of 1s. in the £ annually on the assessable value of the property so served.

Welwyn R.D.C.—Subject to the water mains being laid with 3 ft. cover instead of 2ft. 6 in., the Local Government Board have sanctioned an outlay of £200 upon works of sewerage and water mains.

WATER, GAS, AND ELECTRICITY.

Barrow T.C.—Tenders aggregating £11,000 have been accepted in connection with the new gasworks.

Bradford T.C.—[illegible] are recommended by the [illegible] Committee to carry out certain works and transformer chambers at an estimated cost of £2,000.

Cheadle R.D.C.—The council have instructed Messrs. William [illegible] to prepare a scheme of water supply for various districts in the parishes of Caverswall, Consall, and Cheddleton. The water will be obtained from springs at Wall Myres, and pumped to [illegible]. It will [illegible] the [illegible] districts. Special arrangements are to be made for the supply of the County Mental Hospital, where there are some 700 patients.

Doncaster R.D.C.—The council have accepted the tender of Mr. Charles Fletcher, at £194, for laying water mains, and the tender of Messrs. Newton Chambers & Co., of Sheffield, at £528, for erecting a tank (estimated storage 37,000 gallons).

Forfar T.C.—It has been agreed to provide vertical retorts at the gasworks, at an estimated cost of about £10,000.

Okehampton T.C.—The borough surveyor, Mr. F. J. Warder, has received instructions to report on the best means of supplying a storage reservoir for improving the water supply and increasing the area of the Okel basin.

Paignton U.D.C.—Tenders are being obtained for water main extensions in Marldon-road and Preston Sands-road.

Perth T.C.—The report in connection with the water supply has now been received. An inquiry has been in the hands of a Special Committee, and the engineers employed by them for a period extending to about fifteen months, and recently the committee, accompanied by the engineers, made an extensive tour in England with a view to getting information and bringing forward what they thought would be a satisfactory solution to the water and sewage problem. It is understood that in the report the engineers favour what is known as the Bertha scheme, which, it was originally stated, would cost at least £125,000 to carry out. The proposal is that ground should be acquired on the policies of Bertha, on the north bank of the river Almond, about where that river enters the Tay, for the purpose of creating a large pond, into which should be turned the waters of the Tay, which would be allowed to settle prior to being pumped into the city. The proposal also hinted at the desirability of removing the existing pumping station from the foot of Marshall-place to the vicinity of Bertha.

Withernsea U.D.C.—The council on Monday sealed an agreement for the public supply of water for all purposes from the Hull Corporation in perpetuity. The price is fixed on a sliding scale, commencing at 1s. 3d. per 1,000 gallons for a minimum 55,000 gallons per day, after the first six months, during which the council pays for the actual consumption, reducing to 10½d. for a minimum of 200,000 gallons.

MISCELLANEOUS.

Devonport T.C.—The Surveyor's Committee recommend the council to acquire the freehold of land in the vicinity of the corporation storeyard, at the price of £7,500.

Manchester T.C.—The city surveyor, Mr. T. de Courcy Meade, has been instructed by the Parks Committee to consider and report as to the cost of constructing a light electric railway round Heaton Park, such report to indicate what portion of the cost would be represented by labour which could be accomplished by the unemployed.

PERSONAL.

Mr. Geo. [illegible] Williams has been appointed assistant surveyor to the Swansea Rural District Council.

Mr. H. C. Low, of Wimborne, has been appointed a temporary assistant in the surveyor's department, Harrow.

Mr. W. W. Walker, of Sheffield, has been appointed surveyor and inspector of nuisances to the Alford Urban District Council, at a salary of £78 per annum.

Mr. H. Percy Boulnois, M.Inst.C.E., the well-known municipal engineer, has been elected an honorary member of the Quantity Surveyors' Association. We [illegible] Mr. Boulnois on having received this unsolicited honour.

Mr. Stanley Easter, pupil of Mr. F. L. Burch, engineer and surveyor to the East Dereham Urban District Council, has been appointed surveyor's assistant to the East Molesey Urban District Council, at a salary of £80 [illegible].

Mr. Richard F. Braithwaite, surveyor to the Selby Rural District Council, was married on the 22nd inst. to Miss Beatrice M. Fail, daughter of Mr. Henry Fail, J.P., of Monkhesden, at Wistow Bar Parish Church. Mr. J. Townend, clerk to the Selby Rural District Council, was best man.

Mr. D. H. Steward, district surveyor to the Norfolk County Council, has been appointed assistant to the county surveyor of Pembrokeshire, Mr. T. George, and will take up his duties about the middle of next month. The vacancy under the Norfolk County Council has been filled by the appointment of Mr. G. E. Mullard, surveyor of the Eastern District of the Docking (Norfolk) Rural District Council.

FOR OTHER ADVERTISEMENTS

See End of Paper.

CITY OF BIRMINGHAM.

The Public Works Committee are prepared to receive applications for the appointment of two thoroughly competent Road Foremen in the City Surveyor's Department. Wages, 40s. per week rising by annual increments of 2s. 6d. per week to 45s. Candidates must be fully qualified persons, who have had recent practical experience in the construction, maintenance and scavenging of the various classes of roads and streets of a large town; also in the management of large bodies of workmen. They must be able to keep clearly their notebooks, set out works from plans, measure up works in course of construction, and prepare estimates.

The candidates appointed will be required to devote the whole of their time to the service of the Corporation, and also to contribute to the Superannuation Scheme, for which purpose they must submit themselves to the Corporation Doctor for examination. The appointments will be subject to the Doctor's report being satisfactory. Applications, in candidate's own handwriting, stating age (which should not exceed 40), experience, past and present employment, accompanied by copies of not more than three recent testimonials, and endorsed "Road Foreman," to be sent to the undersigned not later than Monday, 16th November, 1914.

Canvassing, either directly or indirectly, will be a disqualification.

HENRY E. STILGOE, M.Inst.C.E.,
City Engineer and Surveyor.

Council House, Birmingham.
October 28, 1914. (2,048)

ASSISTANT ENGINEER required for the Lagos Municipal Board of Health, Nigeria, for a period of eight to twelve months, with possible extension. Age 25-40. Salary £300. Free quarters and first-class passages. Liberal leave in England on full salary. Candidates possessing an all-round knowledge of the duties of a Municipal Engineer's Office and experienced in the valuation of property should apply at once by letter to the Crown Agents for the Colonies, Whitehall-gardens, London, S.W. (2,051)

REQUIRED at once one Senior Private Street Works Assistant. Salary £2 15s. per week; also two Junior Private Street Works Assistants. Salary £2 5s. per week. Temporary engagement until termination of the War, or at least for twelve months. Apply, with full particulars of experience and copies of testimonials, to Box 1,479, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (2,050)

ENGINEERING ASSISTANT (23), three years' articles in City Engineer's Office, desires appointment in municipal office. Competent surveyor, leveller, Stud.Inst.C.E.—Box 1,478, office of The Surveyor, 24 Bride-lane, Fleet-street, E.C. (2,049)

Standard of a Habitable House in Town and Country.*

By A. B. DUNNE, L.A., M.B., Medical Officer of Health, Doncaster Rural District Council and Bentley Urban District Council.

I propose to limit my paper to a consideration of "the standard appropriate" houses inhabited by what may be broadly termed the working classes. The question of a standard for new houses, both in town and country, presents no essential difference, although subject to modification by locality, type of workmen to be housed, rate of wages, &c. Another point, and in my opinion a very important one, is what standard should be applicable to existing houses? This raises issues in which "the personal equation" of the individual medical officer of health must of necessity play an important part, and still more so that of the local authority.

Let us first of all direct our attention to the standard which is required for a house to be occupied by the regularly employed artisan or collier. For the less fortunate workman in the towns and the agricultural labourer a cheaper class of house is required, simpler and more restricted in its conveniences.

I have recently been interested in a scheme for housing the working classes initiated by the urban district council of Bentley, which may be regarded as a typical modern mining community. A type of house is designed to let at 7s. per week clear. A description of this class of house, designed by the council's surveyor, Mr. R. G. Whiteley, for the accommodation of artisans and colliers, well illustrates the standard of an urban working man's dwelling.

The ground plan shows living-room, scullery, food-store, coal-place, and closet; on the first floor there are three bedrooms. There are no out-buildings or projections from the main buildings, all are under one roof. The living-room is 15 ft. by 12 ft. 6 in. clear, and scullery 11 ft. 6 in. by 9 ft. 6 in., with copper, sink, and bath provided. Access to the water-closet and the coal-place is from the recessed porch of the back entrance. There is a recessed porch to the front door. A food-store 6 ft. by 2 ft. 7½ in., which ventilates directly into this porch, is provided alongside the living-room. A staircase 2 ft. 9 in. wide leads directly out of the living-room, and is placed over the coal-store and closet. The first floor contains three bedrooms, as follows: No. 1, 12 ft. 6 in. by 10 ft. 3 in.; No. 2, 11 ft. 6 in. by 9 ft. 6 in.; No. 3, 9 ft. 6 in. by 7 ft. 6 in. All the bedrooms can be entered directly from the landing, and are provided with fire-places, with the exception of No. 3. The frontage of such a house is 18 ft. 9 in., and the depth 23 ft. 10½ in., and are intended to be erected in blocks of six or eight. It will be noticed that no "hall" or "parlour" is provided.

Such, then, is a standard house for, if one may so call him, a standard workman with a standard family.

A few general observations are necessary.

I take it that any dwelling intended for permanent occupation must be built of bricks and mortar, the common currency of the building trade, as one may term them. So far as I am aware, no cheaper form of material has successfully established its claim to supplant them.

SITE OF DWELLINGS.

Much of the present deplorable state of the housing which now exists is due to the fact that any place was thought good enough to build a house upon, and to a certain extent the same is true to-day. Therefore one of the most useful provisions in any town planning scheme is that which enables the local authorities to determine what parts of an area are to be allotted to dwelling-houses, factory sites, &c. Much low-lying and otherwise unsuitable land for building houses upon will thus be ruled out. Now that the value of direct sunlight is becoming more appreciated, there is additional reason that the living-room should have a south-east or south-west aspect.

The minimum accommodation required resolves itself into the question of individual requirements and wages, but apart from this, what should guide an authority in designing a house? Having visited many workmen's homes, I am of opinion that a large sunny living-room, at least 14 ft. by 12 ft., is a *sine qua non*, and my opinion has been confirmed by answers I have received from housewives whom I have questioned.

It has been argued that another room or parlour should be provided; that the husband or young couple must be thought of. My answer is that the claims of the housewife come before the husband, and that the young couple will look after themselves. What use is a parlour in most cases? I have more often than not found it unfurnished, or used to store the bicycle or pram in; sometimes let off to another family, or used as a bedroom for a lodger. The choice lies between a large, cheery living-room, with plenty of elbow room, and a cramped living-room and a pokey parlour.

Is a "hall" required? No. This cannot be without sacrifice of valuable space, which can be better utilised in the general living-room than being wasted by being cut off as a dark, narrow passage, which leads to a front door seldom, if ever, used.

Of what material should the floor of the living-room be? Much may be said for a board floor, but this presumes sound, seasoned wood, and good, honest workmanship. A board floor is hard to keep clean, often harbours filth, and is much more difficult to scrub than a tiled one. I am myself in favour of tiles or "quarries" set in cement. Few will deny that one's own kitchen thus floored is among the cleanest and most comfortable of rooms. Ask a woman of experience which is the easiest to keep clean, and she will say a tiled floor. This floor is dry, clean and durable.

A good closed range is both economical in cooking and cleanly, and has this advantage over an open or Yorkshire range, that more than one pan at a time can be used for cooking.

An essential to a living-room is the provision of one or more large cupboards.

A good scullery is the next essential. I have presumed that water is laid on over a glazed earthenware sink provided with a large hardwood drainage board. A copper should be provided fitted with a galvanised iron cover, so arranged as to permit the steam to escape up the flue. Lastly, a bath should be provided with hot and cold water laid on, and should have a hinged lid to cover it when not in use. Much amusement has from time to time been aroused by tales concerning the uses to which the bath has been put. I have made it a point to examine as many baths as I could, and have not up to now found any rabbits or boxes of bedding-out plants kept in them. I think too much has been made of the misdeeds of tenants.

Is a water-closet an essential? In a house such as I am describing, erected in a locality where there is a public water supply and a sewage disposal system, a pedestal water-closet is an essential. Between the water-carriage system and any other, at all events as regards urban communities, "the verdict of the stricken field has been given," to use a picturesque phrase of Lord Salisbury. The water-closet is placed in a closet which is isolated from the house by the rear recessed porch; this arrangement allows of a greater degree of privacy, and permits of a back-yard unobstructed by outbuildings, an important matter when the washing is done at home and the clothes have to be hung out to dry in the backyard.

THE FOOD-STORE OR PANTRY.

This very essential provision has hardly received the attention which it deserves. The food-store in the past has been an afterthought, but I have noticed in the new colliery village houses that very satisfactory ones are provided; in fact, more so than in my own house, which is of the under-stairs type.

The ideal food-store is on the ground floor, with one wall an outside one at least. It need not necessarily be large, as food is not bought and stored in large quantities nowadays; but it should be cool and

* Paper presented at the annual congress of the Royal Sanitary Institute at Blackpool.

[illegible]

[illegible] be provided. In fact, the question of bedroom accommodation ranks along with the living-room as the two important questions in housing. As the [illegible] bed. The largest room will usually be occupied by husband and wife, and should in addition be able to [illegible] 12 ft. 6 in. by 10 ft. 6 in. by 8 ft. will do this comfortably.

The bedroom window should not be less than one-tenth the floor space; this, in my opinion, can with advantage be increased. Let me put in a plea for the sash window, as enabling the room to be more [illegible] type. The latter, with their cheap fittings, soon get broken and out of order, and then the window is seldom opened.

The third bedroom should easily accommodate a single bed, but as single beds are but rarely used by the working classes, it were better that this room should be designed for the use of a double bed. All bedrooms should have a fireplace, but in the type of house we are considering it is usually impracticable to provide fireplaces in all three bedrooms. A ventilating opening must be placed in the outside wall.

THE BACKYARD.

Experience leads me strongly to urge the asphalting of the whole of this. In theory, to reserve some part of it for flower-beds is all very well, but in practice all uncovered earth soon becomes trodden down, and then soaked and soddened with tea-leaves, scraps of broken food, potato peelings, &c. Therefore an asphalted backyard is an essential, as thereby alone can it be kept clean and sanitary.

Finally, sanitary dustbins should be provided. The ones which are supplied are too small in most cases to contain the week's household refuse. Unfortunately, these tins soon get knocked about and worn out and the lids lost, though fastening them by a chain to the house wall will obviate this. A backyard common to a block of houses should not be countenanced. It is a fruitful cause of untidiness, and what is everybody's business to keep tidy is nobody's. The rule should be every house its own backyard.

When we consider the standard of a habitable house for the poorly-paid worker in the town and the agricultural labourer, we are at once faced with the difficulty that the average weekly income of the former may never reach 25s., and in the latter rarely 18s. or 20s.

What rent can these afford to pay, keeping in mind the expense of rearing a family and the enhanced cost of living? I certainly think that 4s. and 3s. a week are the utmost that can be asked. Can houses be built to let within these rentals, and of what materials, on what land, of what size, and with what maximum room accommodation? It has been suggested that the £100 cottage will solve the difficulty in the agricultural districts. Will it? I have my doubts, which have been confirmed by the account that I have read by Dr. R. W. C. Pierce in his annual report for 1913 to the Guildford Rural District Council on the cottages built by Mr. St. Loe-Strachey.

The labourer is worthy of his home, which must be soundly built of durable materials, plain in character, and necessarily shorn of some of the conveniences and amenities found in the urban workman's home—to mention one in particular, a bath. At the Church Congress at Southampton last year Lord Salisbury said that the agricultural labourer did not want one; his lordship's statement was warmly traversed. There are conveniences now lacking in many rural cottages which might well take precedence of a bath. How about a copper? It does duty for both purposes in thousands of homes. I should certainly prefer a copper to a bath any day, and the cottage housewife has my sincerest sympathies when she has to boil the weekly wash in the pot over the open kitchen fire.

As water will rarely be laid on, a well-designed privy should take the place of a water-closet, even for houses under the rank of the country mansion. An experience of country rectories in several dioceses has led me to entertain the opinion that there is much to be said for the advantages of the earth-[illegible] over the water-closet.

Finally, as my paper would run into several appendices, I must conclude with a few words on the standard of habitability of existing houses. What principles should guide one in arriving at the conclusion that "a dwelling-house appears to be in a state so dangerous or injurious to health as to be unfit for human habitation"? Local authorities are apt to take a different view from their professional and statutory advisers as to the grounds on which the representations are based. Briefly, I would enumerate such conditions, either existing alone in such a marked degree or in conjunction with others, as would support such a representation:

(1) Dampness in living-rooms of old houses, due either to walls built without dampcourses, or of very hygroscopic materials, such dampness rising up the walls to a considerable height, or extending over a large area, and persisting even in dry weather.

(2) No through or sufficient ventilation. Among such dwellings I would include those houses which are built "back to earth," where the adjacent earth reaches a high level, and back-to-back houses, so common in the Northern towns.

(3) General dilapidations, under which I include cottages with walls perished, roofs leaky, rafters rotten, bedroom floors sprung and unsafe, and broken tiles laid on earth.

(4) The hopeless cases—for instance, dwellings which have been improvised out of old malt-kilns, barns, cart-sheds, and other miscellaneous buildings.

PRESENTATION TO MR. E. G. MAWBEY.

Mr. E. George Mawbey, M.Inst.C.E., was on Friday evening last presented by his staff with an illuminated address, as an expression of their respect and esteem and of congratulation on the completion of twenty-five years' service as borough surveyor of Leicester.

Mr. Willis Wigg, Assoc.M.Inst.C.E., who occupied the chair, spoke of the sterling qualities of Mr. Mawbey, both as an engineer and as a chief, in respect of his relations with his staff, who were always treated with the greatest consideration and kindness, and who had benefited largely by the example set before them by the borough surveyor. On behalf of the staff he wished Mr. Mawbey many years of happiness and prosperity, and expressed the hope that he might long continue to occupy his present position. Mr. Wigg read a letter of deep appreciation of Mr. Mawbey's qualities from Mr. Charles F. Lythall, who was unavoidably prevented by indisposition from being present. In this the writer called attention to the large number of previous members of the staff who were now holding positions as city and borough surveyors in other towns, this being, in no small measure, due to Mr. Mawbey's readiness always to help.

Mr. J. Edwin Roper, L.R.I.B.A., the senior assistant of the town hall staff, after a few appreciative remarks, then read and presented the framed address.

Mr. Mawbey, who was received with loud applause, expressed his great surprise and unqualified pleasure at being made a recipient of so handsome a tribute, and emphasised the loyal service he had received from his staff throughout the whole of the twenty-five years. He said that it was the proudest moment of his life, and he could not express how deeply he felt this spontaneous expression of the generous feeling of his staff towards him. He spoke in the highest terms of the splendid services his staff had rendered in the town, and the very valuable and efficient assistance they had at all times given to him in all the great works and routine duties for which his department had been responsible.

Surveyors' Institution Junior Meetings. — The president of the Surveyors' Institution has awarded to Mr. Bernard Gasson, of Child's Hill, London, N.W., the prize for the best paper submitted for reading during the coming session. Mr. Gasson's paper, which is entitled "Some Elements of Specification Writing," will be presented at the meeting to be held at the institution on Monday, November 16th.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. Horace Boot, M.I.E.E., M.I.Mech.E

EASTERN AND NORTH-EASTERN DISTRICTS.

An Eastern and North-Eastern District meeting (the programme of which appeared in last week's Surveyor) will be held at Lincoln to-morrow (Saturday).

B. Wyane,
39 Victoria-street, S.W. *Secretary*

Iron and Steel.

OSWESTRY.—November 9th.—For laying cast-iron mains, sluice valves, fire hydrants, and air valves, for the rural district council.—Messrs. Berrington, Son, & Watney, Prudential Chambers, Wolverhampton, and 28 Victoria-street, Westminster, S.W.

CROYDON.—November 10th.—For the supply of 830 tons of cast-iron pipes and specials, for the corporation.—Borough Engineer.

Roads.

SUNBURY-ON-THAMES. — November 2nd. — For road widening and reconstruction, for the urban district council.—Mr. H. F. Coales, engineer.

WHITLEY AND MONKSEATON.—November 2nd. —For works of public and private improvement, for the urban district council.—Mr. A. J. Rousell, surveyor, Whitley Bay.

ROTHWELL.—November 2nd.—For laying concrete foundations and paving with granite setts, for the urban district council.—Mr. J. Southwart, surveyor.

SOUTHALL-NORWOOD.—November 2nd.—For the supply of road materials, for the urban district council.—Mr. R. Brown, engineer and surveyor, Town Hall, Southall.

THE MALDENS AND COOMBE.—November 3rd.— For making-up work and paving with artificial slabs, for the urban district council.—Mr. R. H. Jeffes, Municipal Offices, New Malden.

LLANDAFF.—November 3rd.—For works of street improvement, for the rural district council.—Mr. J. Holden, surveyor, 20 Park-place, Cardiff.

RATHDOWN.—November 3rd.—For making a new road, for the rural district council.—Mr. P. Cunniam, clerk, Loughlinstown.

CARSHALTON.—November 4th.—For the supply of granite, granite chippings, and hire of steam roller, for the urban district council.—Mr. W. Willis Gale, surveyor.

LARNE.—November 4th.—For work of road construction, for the rural district council.—Mr. T. Nelson, clerk.

CAMBRIDGESHIRE. — November 4th. — For the supply of broken granite, basalt, slag, and tarred macadam during the year ending March 31, 1916, for the county council.—The Clerk, County Hall, Cambridge.

GLASGOW.—November 5th.—For making up certain streets, for the corporation.—Office of Public Works, 64 Cochrane-street.

MANCHESTER.—November 6th.—For paving certain streets with granited rock asphalt, for the corporation.—Surveyor, Town Hall, West Didsbury.

BRIGHOUSE.—November 7th.—For paving work with granite setts on concrete, and other incidental work, for the corporation. — Mr. S. S. Haywood, borough engineer and surveyor.

POULTON-LE-FYLDE. — November 7th. — For making up a street, for the urban district council.— Mr. J. B. Moss, surveyor.

NORFOLK.—November 7th.—For the supply of granite for the year ending December 31, 1915, for the county council.—Mr. T. H. B. Heslop, county surveyor, The Shirehouse, Norwich.

WEST SUSSEX.—November 7th.—For the supply or hire of steam rollers, for the county council.—Mr. H. W. Bowen, county surveyor, North-street, Horsham.

WEST SUSSEX.—November 7th.—For the supply of about 200,000 gallons of tar, for the county council.— Mr. H. W. Bowen, county surveyor, North-street, Horsham.

WEST SUSSEX.—November 7th.—For the supply of broken granite, quartzite, or other approved stone, chippings, tarred macadam, picked surface flints, pit flints, sand or binding material, cartage, and team labour, for the Roads and Bridges Committee.—Mr. H. W. Bowen, county surveyor, North-street, Horsham.

HAYWARDS HEATH.—November 9th.—For private street works, for the urban district council.—Mr. G. Plummer, engineer and surveyor.

KENILWORTH.—November 9th.—For the supply of broken granite and slag, for the urban district council.—Mr. S. Douglas, engineer and surveyor.

ISLINGTON.—November 10th.—For paving with granite setts and wood blocks, for the borough council. —Mr. J. Patten Barber, borough engineer.

CHIPPENHAM.—November 10th.—For the supply of granite macadam, chippings, tarmacadam, steam rolling, disinfectants, tar, Tarvia, and similar materials, for the corporation.—Mr. A. E. Adams, borough surveyor.

NEWMARKET.—November 12th.—For the supply of a steam roller with scarifier, for the urban district council.—Mr. William Henry Eley, engineer and surveyor.

READING.—November 12th.—For making up part of Albert-road, for the sanitary authority.—Mr. J. Bowen, borough engineer and surveyor.

HASTINGS.—November 14th.—For the supply of 1,000 yds. of unbroken blue stone, for the rural district council.—Mr. D. Paine, surveyor, Stonelynk Farm, Fairlight, Hastings.

EAST SUSSEX.—November 16th.—For the supply of materials, haulage, and team labour, for the county council.—Mr. F. J. Wood, county surveyor, County Hall, Lewes.

LUTON.—November 16th.—For the supply of broken slag, for the year ending November 30, 1915, for the corporation.—Borough Engineer.

SOUTHAMPTON.—November 18th.—For the hire of steam rollers during the year ending March 31, 1916, for the county council.—County Surveyor, The Castle, Winchester.

SOUTHAMPTON.—November 18th.—For the supply and delivery of tools for use on main roads, for the county council.—County Surveyor, The Castle, Winchester.

SOUTHAMPTON.—November 18th.—For the supply of stone for the repair of the main roads, for the county council.—County Surveyor, The Castle, Winchester.

Sanitary.

AUCKLAND.—November 2nd.—For providing and laying down glazed earthenware pipe sewer and manholes, for the rural district council.—Mr. C. Heslop, sanitary surveyor.

RHYMNEY.—November 3rd.—For the construction of main outfall sewer, for the Sewerage Board. —Messrs. Willcox & Raikes, 63 Temple-row, Birmingham.

EALING.—November 3rd.—For the construction of a relief surface-water sewer and manholes, about 5,400 ft. of 24-in. armoured concrete tubes, for the corporation.—Mr. W. R. Hicks, borough engineer.

EPSOM.—November 3rd.—For the construction of concrete tube storm relief sewer and other works, for the urban district council.—Mr. Edward R. Capon, surveyor, Bromley Hurst, Church-street, Epsom.

BELFAST.—November 3rd.—For the construction of sewers and manholes, for the corporation.—City Surveyor.

RHYMNEY VALLEY.—November 3rd.—For the construction of main outfall sewer, for the Rhymney Valley Sewerage Board.—Messrs. Willcox & Raikes, 63 Temple-row, Birmingham, or Mr. T. J. Thomas, 63 High-street, Bargoed, Glam.

EAST STOW.—November 9th.—For the construction of a sewer and manholes, for the rural district council.—Mr. H. E. Wilkes, clerk, Market-place, Stowmarket.

EAST STOW.—November 9th.—For work of sewer extension, for the rural district council.—Mr. H. E. Wilkes, clerk, Market-place, Stowmarket.

HOLYWOOD (Co. Down).—November 5th.—For work of sewerage, for the urban district council.—Mr. D. Bell, clerk.

BURNHAM (Somerset).—November 7th.—For the construction of sewers, manholes, ejectors, power station, and other contingent works, for the urban district council.—Mr. W. H. Chowins, engineer, Public Offices, Burnham.

GLASGOW.—November 7th.—For the construction of a cast-iron pipe drain, for the corporation.—Mr. J. Lindsay, town clerk.

ROCHFORD.—November 9th.—For constructing about 3¼ miles of glazed-stoneware and cast-iron pipe sewers, together with manholes and other works, for the rural district council.—Mr. A. C. Madge, surveyor.

EASINGTON.—November 10th.—For the construction of about 16,000 lin. yds. of stoneware and cast-iron pipe sewers, with manholes, flushing chambers, and other works connected therewith, for the rural district council.—Mr. G. Waterhouse, engineer.

LICHFIELD.—November 11th.—For laying sewer and manholes, for the rural district council.—Mr. C. O. Rawstron, surveyor.

ASHTON-UNDER-LYNE.—November 11th.—For the extension of the sewage disposal works, for the corporation.—Mr. J. Rowbottom, engineer, Town Hall.

ORSETT.—November 18th.—For the construction of sewers, and providing engines, compressors, ejectors, and other works, for the rural district council.—Messrs. H. Walker & Son, Albion Chambers, Kingstreet, Nottingham.

ALEXANDRIA.—December 8th.—For the construction of a sewerage system, for the municipality.—"M. le Président de la Commission Municipale d'Alexandrie." Alexandria.

Stores.

BIRMINGHAM.—November 4th—9th.—For the supply of stores, for the Water Committee.—Foreman, Brasshouse-passage, Broad-street.

CHATHAM.—November 11th.—For the supply of gravel, sand, Portland cement, crushed ragstone, bricks, lime, clothing, sewer boots, stoneware drain pipes, gullies, sewer ironwork, timber, picks and shovels, for the corporation.—Borough Surveyor.

Miscellaneous.

TOTTENHAM.—November 3rd.—For the supply of a petrol motor ambulance, for the urban district council.—Mr. W. H. Prescott, engineer.

WESTMINSTER.—November 4th.—For the supply of motor tip wagons, to be used with interchangeable dust and water bodies, for the borough council.—Town Clerk.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance. ‡ Provisionally accepted.

BEDLINGTON.—Accepted for the supply of 5,000 tons of hand-broken road whinstone, for the urban district council.—Mr. J. F. Johnston, surveyor:—
Cork Apsley, Limited, Lesbury, Northumberland
Ewesley Quarry Company, Limited, Newcastle-on-Tyne.

CHISWICK.—For making up a street, for the urban district council.—Mr. E. Willis, surveyor:—

G. Wimpey & Co., Hammersmith, W.	£985
T. Adams, Wood Green, N.	968
E. & E. Iles, Wimbledon	920
H. Farrow, Brixton	900
D. T. Jackson, Barking	895
Free & Sons, Maidenhead	880
A. T. Brummell, Willesden	808
M. N. Rhodes, Chessington, Surrey*	730

CHISWICK.—For the construction of a brick and concrete culvert, for the urban district council.—Mr. E. Willis, surveyor:—

T. Adams, Wood Green, N.	£427
G. Wimpey & Co., Hammersmith, W.	399
D. T. Jackson, Barking	360
T. W. Pedrette, Enfield	336

Roadstone Supply Company, Shepton Mallet	12	9

4-in. by 4-in. Granite Setts.—A. & F. Manuelle, London, 36s. 6d. per ton.

PORTLAND.—Accepted for the construction of a public convenience, for the urban district council.—Mr. R. S. Henshaw, engineer and surveyor:—
Jesty & Baker, Portland, £88.

ROYSTON.—For alterations to sewers, manholes, and ventilators, and the construction of flushing tanks, for the urban district council.—Mr. T. W. Witts, surveyor:—

H. S. Wallis, Limited, Ipswich	£220
Jacklin & Co., Royston	182
W. H. Hinkins & Son, Royston	162

Surveyor's estimate, £172.

SHEFFIELD.—For the execution of works in connection with the covering of the river Sheaf, consisting of bridge widening, new weir, new bridge, retaining wall, and new street, for the corporation.—Mr. C. F. Wike, city engineer:—
Wellerman Brothers, Limited, Sheffield, £8,378.

SHREWSBURY.—For laying 530 lin. yds. of 12-in. pipe sewer and manholes, for the corporation.—Mr. A. W. Ward, borough surveyor:—
Emery & Co., Aston, Birmingham.

WATH-UPON-DEARNE.—For the alteration and reconstruction of the sewage disposal works, for the urban district council.—Mr. J. H. Drew, engineer:—

Ward & Tetley, Bradford	£15,833
H. & E. Andrews, Sheffield	15,703
R. Snell, Rotherham	14,580
Inns & Co., St. Mellons	14,232
Bushby & Sons, Leeds	13,673
Yorkshire Hennebique Company, Leeds*	13,779

WELWYN.—For constructing sewer and [illegible] the parish district council. Mr. F. L. Morris [illegible]

W. [illegible], Fleet Gate, London, E. [illegible]
G. W. Elkins, Welwyn [illegible]
J. Newton, Welwyn [illegible]

WESTHOUGHTON.—Accepted for sewage works extension for the urban district council. Mr. H. Davies, the county surveyor.

J. Dickinson & Son, Westhoughton, £3,500.

WEST SUSSEX.—For the erection of [illegible] schools for the Lindfield Urban District. Mr. E. P. Roberts, county education architect:—

New School at Newtimber.

C. V. Boughton, Chiddingfold	£2,272
Rowland Brothers, Horsham	[illegible]
J. Barnes & Sons, Brighton	2,059
J. [illegible], Penmouth	[illegible]
H. [illegible] & Son, Burgess Hill	[illegible]
Parsons & Fuller, Access Godalming	[illegible]
R. [illegible] & Sons, Crawley	[illegible]
J. Hillman & Sons, [illegible]	[illegible]
H. Miller & Sons, Limited, Witley	[illegible]
H. [illegible] & Sons, Ashburst	[illegible]
F. Sendell & Sons, Worthing	[illegible]
A. Crane, Worthing	[illegible]

New School at Lower Beeding (Horsham).

G. Graham, Southwick	[illegible]
Rowland Brothers, Horsham	[illegible]
H. Baker & Son, Horsham	[illegible]
A. [illegible] & Co., Crawley	[illegible]
J. Longley & Co., Crawley	1,697
J. Barnes & Sons, Brighton	1,687
R. Cook & Sons, Crawley	1,656
Murrell Brothers, Horsham	1,647
W. F. Sendall & Co., Horsham	1,642
J. Linfield & Sons, Limited, Littlehampton	1,615
F. Sendell & Sons, Worthing	1,565
J. Rickman & Son, Ifield, Horsham	1,116
A. Crane, Worthing	1,301

WIGAN.—For paving work with granite setts, for the corporation.—Mr. A. T. Greenham, borough engineer.

W. K. Worthington, Limited, Manchester	£1,303
T. [illegible], Westhoughton	[illegible]
Webster & Winstanley, Wigan	1,189
P. [illegible], Liverpool	[illegible]

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

OCTOBER.

31.—Institution of Municipal Engineers: Eastern and North-Eastern District Meeting at Lincoln.

NOVEMBER.

2.—Royal Institute of British Architects: Ordinary General Meeting. 8 p.m.

2.—Prof. E. R. Matthews on "Reinforced Concrete in Municipal Engineering Works." University of London, Gower-street, W.C. 5.30 p.m.

3.—Institution of Civil Engineers: Inaugural Meeting of the Session; Address by Mr. B. Hall Blyth, M.A., the President, and presentation of medals awarded by the council. 8 p.m.

9.—Surveyors' Institution.—Mr. H. Clement Clarke, president, delivers his opening address. 8 p.m.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, *but those responsible for their despatch are recommended to arrange that they shall reach* THE SURVEYOR *office by noon on* WEDNESDAYS *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

RHYMNEY VALLEY SEWERAGE BOARD.

RHYMNEY VALLEY SEWERAGE CONTRACTS.

The Rhymney Valley Sewerage Board invite applications for the appointments of Inspectors in connection with the above Contracts, which comprise a Main Sewer, Storage Tanks (partly of Reinforced Concrete), Cast-iron Discharge Mains and Works on the foreshore of the Bristol Channel.

Salary from £2 10s. to £3 per week, according to qualifications.

Previous experience in the superintendence of work of a similar nature is essential, and full particulars of such experience, together with copies of recent testimonials, must be forwarded by the candidates with their applications, in envelopes endorsed "Rhymney Valley Sewerage, Inspectors," and addressed either to Messrs. Chatterton & Alford, 9 Victoria-street, Westminster; or to Messrs. Willcox & Raikes, MM.INST.C.E., 63 Temple-row, Birmingham, not later than October 31st, 1914.

T. J. THOMAS,
Clerk to the Board.

36 High-street,
Bargoed, Glam.
October 9, 1914. (1,996)

RURAL DISTRICT COUNCIL OF CHELMSFORD.

ASSISTANT ENGINEER AND SURVEYOR.

The Council require the services of an Assistant in the Office of their Engineer and Surveyor. Applicants must have had previous experience in Engineering and Surveying, including Water Engineering and the supervision of roadmaking, taking levels, and superintending small pieces of erection.

Salary (to include travelling expenses) commencing at £90 per annum, rising by annual increments of £10 (subject to satisfactory service) to £120 per annum.

Applications, stating age and previous experience, and accompanied by copies of three recent testimonials (which will not be returned), to be sent to the undersigned not later than the 3rd November, 1914.

By order,
ARTHUR S. DUFFIELD,
Clerk.

96 High-street, Chelmsford. (2,022)

ATHERSTONE RURAL DISTRICT COUNCIL.

SURVEYOR'S DEPARTMENT.

Applications are invited for the position of Assistant to the Engineer and Surveyor. Salary at the rate of £100 per annum. Applications, with copies of not more than three recent testimonials, to be sent to me on or before Monday, 2nd November, 1914.

H. J. COLEBY,
Engineer and Surveyor.

102 Long-street,
Atherstone. (2,037)

BOROUGH OF MONMOUTH.

Applications are invited for the appointment of Borough Surveyor and Inspector of Nuisances.

Salary £130 per annum. The person appointed will be required to devote his whole time to the service of the Town Council.

Candidates are requested to apply in own handwriting, and to state age and previous experience and qualifications. Applications, with three recent testimonials, to be received on or before the 14th November, 1914.

BICKERTON H. DEAKIN,
Town Clerk.

Monmouth.
October 28, 1914. (2,046)

WANTED, temporarily, Assistant accustomed to Surveying and routine work of a Municipal Engineer's Office. Salary £2 10s. per week. Applications, stating age, experience, qualifications, and other particulars, accompanied by copies of recent testimonials, to be sent to the Borough Engineer and Surveyor, Town Hall, Bedford. 2,045

CITY OF BIRMINGHAM.

ENGINEERING ASSISTANTS.

Required immediately, in the Office of the City Engineer and Surveyor, two Engineering Assistants with good all-round experience. Candidates must be good surveyors, levellers and expert draughtsmen, experienced in the preparation of plans, estimates and specifications for public and private street works; also in bridge and roof construction, and in Sewerage. Salary £130, rising by annual increments of £10 to £150, per annum.

The candidates appointed will be required to subscribe to the Corporation Superannuation Scheme, and for that purpose must submit themselves to the Corporation Doctor for examination. The appointments will be subject to the Doctor's report being favourable.

Temporary Engineering and Surveying Assistants having similar experience are also required. These will not be required to subscribe to the Superannuation Scheme.

Applications, endorsed "Engineering Assistant" (or "Temporary Assistant," as the case may be), stating age, qualifications and experience, and accompanied by copies of not more than three recent testimonials, to be delivered at my Office not later than 12th November, 1914.

HENRY E. STILGOE,
City Engineer and Surveyor.

The Council House,
Birmingham. (2,044)

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. NOVEMBER 6, 1914. No. 1,190.

Minutes of Proceedings.

Extraordinary Traffic: "Betterment."

Among the contentions which are sometimes put forward to resist, or at any rate to abate, a claim for extraordinary traffic expenses are two of a directly contrary kind. The nature of these defences may be indicated by two words—extravagance and parsimony. Sometimes it is asserted that the authority have incurred reckless expenditure in what they have done for the restoration of the road—sometimes that they have failed to keep it in a proper condition to sustain the ordinary traffic. Closely connected with the first allegation is the question of "betterment." It sometimes happens that the damage done renders it absolutely necessary to do repairs which, though essential to the rehabilitation of the road, do undoubtedly leave it a better road than it was before the traffic took place. Is this "betterment" to be taken into account and allowed for in assessing the amount recoverable? The authorities are conflicting. In *Swaby* v. *Oswestry Board* (44 J.P., 766) the Court declined to reduce the claim on any such ground. There an indifferent road, sufficient for the ordinary light traffic of the district, after being damaged by the defendant's heavy motor traffic was reconstructed and made into a road of a superior class. Mr. Justice Lush said: "This road was apparently made for a much lighter kind of traffic, and sufficed for that traffic till the engines came to be used. The consequence has been that the Highway Board found it necessary to put the road into thorough repair, and this could not be done without reconstructing it in a better and more permanent manner. It is said that the road is now better than it ever was before. That has, no doubt, been the inevitable consequence of the damage done by the locomotives, and it seems that the board cannot sever the one cause of expenditure from the other. That is not their fault. It must be on the wrongdoer to bear that inconvenience."

This principle was also applied in an unreported case referred to in Mr. Barnard Lailey's "Law of Extraordinary Traffic on Highways" (at p. 70). That was the case of a country lane with a very narrow metalled way bordered by grass waste. The traffic consisted of the cartage of building materials in a continuous string of large carts, passing along the road almost daily for many months. They soon cut through the crust of the road and diverged on to the waste, so that in the winter rains the whole became an almost impassable slough. The highway authority repaired the whole with granite (instead of with local gravel as in the past), the metalled way being thus almost doubled, and the expenditure far in excess of what had ever been spent before either on this road or on an equal length of any other road of the same class. Nevertheless, they recovered the full amount of their claim (*Hertfordshire County Council* v. *Austin*, Herts Assizes, July, 1902). But in a more recent case, where it was not disputed that the road had got a new lease of life, of which the highway authority would have the benefit, Mr. Justice Jelf took a different view. After ascertaining the difference between the cost of the repairs necessitated by the traffic and the normal cost of repair, he deducted one-third of the sum so arrived at as an allowance for the "betterment" of the road (*Kent County Council* v. *Kent Coal Concessions, Limited*, 72 J.P., 507). In the publication to which we have referred above Mr. Lailey argues forcibly, and we think convincingly, in favour of the correctness of the earlier decisions, and contends that betterment is not *in itself* a ground of deduction. If betterment results from needless expenditure, deliberately incurred with that object, no doubt the money unnecessarily spent cannot be recovered. But this results not from the fact of betterment, but because the expense in question cannot be said to have been "incurred by reason of the damage caused." On the other hand expenditure actually necessitated by the damage is none the less recoverable because it happens to result in the betterment of the road. Betterment alone is not evidence of extravagance. No doubt where betterment has resulted the question of the necessity of the expenditure may sometimes be a difficult one to decide.

* * *

A Presidential Address.

The new president of the Institution of Civil Engineers, Mr. Benjamin Hall Blyth, M.A., being the first engineer practising in Scotland who has held that office, took as the general subject of his inaugural address, delivered on Tuesday last, the progress of engineering in Scotland during the last half century. The first part of the address dealt at some length with the railway systems of the country, the mileage of which has almost doubled during the period under review, while the amount of capital invested and the annual number of passengers carried have been quadrupled in the same time. After reviewing the progress as regards dock construction and equipment, Mr. Blyth proceeded to enumerate some of the principal works of water supply which

[illegible] the duplication of the gas-mains from Milngavie, [illegible] to suppose that the need of some central control of the sources of supply is felt in Scotland, as in England. If the matter be looked at solely from the financial point [illegible] might be saved, and the water supply of the country controlled, if some combination took place between [illegible] allowed to introduce a new water supply. In the [illegible] and village has its own independent supply, with [illegible] and separate lines of main pipes bringing the [illegible] supply. From this instance, which is fairly typical of many others, it will be seen that much is to be said for Mr. Blyth's suggestion that the Legislature should take care that the question of combination is duly considered before any supply for a comparatively restricted district is sanctioned.

The attitude which the new president paid to the great municipalities of Scotland will be read with great interest. He pointed out that tramways are to be found in all the principal cities, being worked on the overhead electric system, with the single exception of Edinburgh, which remains loyal to the cable. The principal advantages of this system are the low cost of working, and—in the case of a beautiful city like Edinburgh—the absence of overhead wires. The great cost of constructing new routes, however, virtually precludes extensions into outlying districts with comparatively small populations, a factor which may be for many a hindering development. In speaking of the work which has been accomplished in regard to town planning, we venture to think that Mr. Blyth took a rather narrow view of the intentions and possibilities of the Act. If it be true, as he suggests, that corporations, both in Scotland and England, have lost their heads in regard to this matter, it must be equally true that the Local Government Board are in the same condition. Mr. Blyth cites the case of Dunfermline and Edinburgh, and asserts that all over Scotland this Act is being strained to its utmost extent by corporations in order to make provision far in excess of anything needed in the near future. In our view this is exactly what the Act intended, and although there may be some room for difference of opinion as to how far the "near future" extends, we are bound to dissent from the view that there has been any thing like a general tendency to look too far ahead, and to reiterate that if this has been done the central authority must share the blame with the local authorities.

* * *

Roadside Waste.

It is a well-known presumption of law that, as a general rule, where there is a highway with fences on both sides the public rights extend to the whole space between the fences. The disadvantage of a presumption is that it may be rebutted, and this presumption is no exception. Accordingly there are several reported cases in which the right of an adjoining owner to strips of greensward adjoining the metalled road has been established, and the claim to include them as parts of the highway has been negatived in consequence of there having been circumstances to rebut the ordinary presumption. From these cases it would appear that the usual grounds on which the claim of the landowner is allowed are either that the disputed ground is or has been part of the metalled road, or that it has been used as private property, and in a manner inconsistent with the existence of public rights. Where, however, notwithstanding acts of ownership by the landowner, there has been a certain amount of public user also it may be a matter of some difficulty to determine whether the presumption holds good.

This state of affairs existed in *Attorney-General* v. *Lindsay-Hogg* (76 J.P., 450). This case was concerned with three roadside strips partly overgrown by trees and underwood, and separated from the adjoining land by an old, irregular hedge on the top of a steep bank. Evidence was given on the one hand, not only of numerous acts of user by the public, but also of the taking of gravel from the land for the purpose of repairing the road. On the other hand, the landowner proved many acts of ownership by his predecessors in title and himself, and the Court came to the conclusion that his evidence outweighed that of the highway authority. Another circumstance which influenced the decision was the fact that the old hedge was originally planted naturally. This in itself probably would not have been conclusive, but in the opinion of the Court it showed that the hedge had no connection with the laying out of the road, and therefore that there was no presumption that it formed the boundary of the highway on that side. In the case of unfenced roads, such as, for instance, those running across a common, the presumption does not arise, and where one side only is fenced it only applies to that side. Where it is clear that a strip does form part of the highway the highway authority would be justified in resisting, by breaking down fences if necessary, any attempt of the landowner to enclose it. But it would be prudent, in disputed cases, before taking this course to obtain a judicial decision, and thus avoid a possible action for trespass.

* * *

War and the Professions.

Among the first concerns of the authorities on the outbreak of war was to anticipate and provide for the inevitable distress among the industrial classes consequent upon the dislocation of trade and the sudden removal to the colours of large numbers of breadwinners. Owing to the generosity of the public in subscribing to the Prince of Wales' and other funds, great strides have been made towards meeting this need, and it is now necessary to remember that there are other classes of the community which have been hit even more promptly and severely than their ordinarily poorer fellows by the sudden dislocation of business which has taken place. We refer, of course, to the professional classes, and particularly to those whose prosperity depends upon the maintenance of peace conditions. Among these people there exists at the present moment a very real and widespread distress, the tragedy of which is in most cases increased by the natural reluctance to disclose their private trouble or to make any claim upon the charitable resources of the country. To meet the pressing needs of these people there has been formed a Professional Classes War Relief Council, for the purpose of giving assistance chiefly in the matters of education, training, emigration, maternity aid, and temporary employment. The council consists of representatives of the chief professional institutions and of the principal societies engaged in the work of organising relief, and we feel sure that they will command much sympathy in their work of assisting a very deserving class over the war period. We venture to bring the work of this council to the notice of our readers, feeling that many of those whose remuneration and security remain unaffected by the war may desire to take the opportunity of assisting their colleagues in kindred professions who are not so fortunately

situated. The offices of the Council are at 13 and 14 Princes Gate, S.W.

Refuse Disposal.

The subject of the paper to be delivered by Prof. R. E. Matthews, the Chadwick Professor of Municipal Engineering in the University of Liverpool, will be the important matters of the collection and disposal of house refuse. As regards collection a theoretically perfect scheme, as Prof. Matthews pointed out, would doubtless be the connecting of each house with a suction main leading to the destructor. Until this ideal can be realised, however, certain practical problems present themselves, one of the most important of which is as to the type of vehicle to be employed. It is generally agreed that, whatever kind of van is used, each should be provided with a movable cover so as to prevent the creation of an objectionable nuisance by the refuse blowing or falling about. A larger question arises, however, in regard to the comparative merits and economy of horse drawn and motor vehicles. For the ordinary work of collection the motor is probably wasteful, owing to the necessarily frequent stoppages. For conveying the refuse to the destructor, however, the motor would appear to be better adapted, and it has been used with considerable success in Paris and other French towns. In this country, on the other hand, the horse-drawn vehicle is in almost universal use, and evidence is really lacking as to the economy of the motor, chiefly on account of the time the vehicle must necessarily stand idle. Prof. Matthews reviewed the several methods of disposal that are in vogue and was, of course, driven to the conclusion that the only really satisfactory method of dealing with the refuse of a town is to burn it. Once this conclusion has been reached, the only two remaining questions are as to the selection of a suitable site and the choice of the best type of destructor. In the lecture which we hope to report at length in next week's issue, both of these matters were dealt with in a very practical way.

* * *

The Hydraulic Mining Cartridge.

Various devices have been brought forward from time to time for the purpose of avoiding the use of explosives for removing rock and other material in places where the shock attendant upon blasting operations would be dangerous to surrounding buildings. Even when blasting operations are conducted in the open it is often difficult to limit the results of the explosion to the desired extent. By the use of the hydraulic mining cartridge, as described in a paper read before the Society of Engineers by Mr. James Tonge on Monday evening, these difficulties may be avoided. In the course of his paper Mr. Tonge drew an interesting contrast between the effect of powerful hydraulic pressure on sandstone and concrete. In the former case there is comparatively slight crushing of the rock before the full pressure of the rams has the effect of causing the mass to bend; considerable pumping and consequent travel of the rams is then necessary before the rock finally begins to crack and break away. With concrete, however, there is usually a perceptible interval during which the rams are crushing or compressing the material, and no movement is noticeable; after this is accomplished a few more thrusts of the rams cause the whole mass to break up without any indications of bending. It may still be necessary to continue to apply pressure and to increase the size of the breaks in the mass, but the greatest shattering effect will have been accomplished at the first disclosure of the cracks, the pressure required to break the mass afterwards gradually diminishing. An example given in the paper of the successful removal of a solid concrete bed from a municipal electricity works, in close proximity to very valuable boilers, engines, and switchboards, proves the efficacy of the cartridge.

* * *

Disease and War.

At the annual meeting of the Sanitary Inspectors' Association, which was held at Caxton Hall on Saturday last, Sir James Crichton Browne delivered a characteristically eloquent address on "The War in Relation to Sanitation." The subject is one upon which we have said a good deal during the past few weeks, realising to the full the important part which preventive medicine plays in securing the welfare of those who are actively engaged in fighting their country's battles.

After commenting upon the successful work carried out in regard to camp sanitation, Sir James pointed out that with the scrupulous cleanliness that was possible in camps and bivouacs in the country, and with the realisation of the value of the open order and no overcrowding, as opposed to the close formation in resisting the attacks of disease as well as the enemy in the field, typhus fever and the devastation of armies in the past need not be feared; at the same time typhoid fever is still a serious menace. With the experience gained in past wars to guide them, we are confident that the authorities are fully alive to the importance of the whole subject, and those who are enlisting can do so with sure and certain knowledge that as regards disease their risks in the present war will probably be less than in any previous campaign. Sir James advocated that our Army of the future should have a special sanitary corps acting under the Army Medical Department, and with suitable military rank. Something is already being done in this direction, and it is earnestly to be hoped that one result of the present disastrous conflict may be to put this important branch of military organisation on a suitable and permanent footing.

* * *

A Welsh Rural Appointment.

Among the "plums" of the municipal engineering profession that should be loved [illegible] after it would be surely the height of injustice to exclude that of the highway surveyorship of Llanybyther. The rural council of this district have issued an advertisement for such an officer, and they are offering the handsome salary of £45 per annum. For this sum the person appointed, so runs the advertisement, must devote three days at least per week on an average to the duties of the office, and whenever the roads are being steam rolled he must attend the work throughout. In addition, he "must also, if and whenever occasion requires, give such additional time as may be necessary in urgent cases without any extra payment." This clause, with the steam roller supervision thrown in, could, of course, be pleaded as justification for extending the "three days at least" per week to six; there is, in fact, no limit to what it may imply when put into practice. But even this does not exhaust the possibilities of the situation, for it is also required that the lucky holder of the position "must prepare all plans and specifications of bridges and other works in connection with the repair and maintenance of the roads, and superintend the same without any extra payment." Also, it is insisted that he shall have a fixed abode in the district. There is probably more than meets the eye in this last-mentioned condition, for it might be contended with some plausibility that a "fixed abode" and the workhouse are merely convertible terms.

Camp Sanitation.

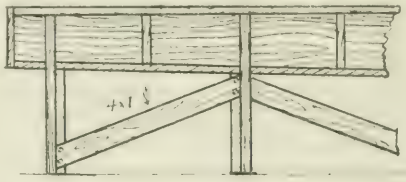
(3.)—ABLUTIONS.

[illegible] are provided with ball hydrants, as the spilling of dirty water in their vicinity might cause fouling of public supplies.

When a stream affords the supply, all washing must [illegible] ing water for men and animals. Should other units or persons require the same stream below the camp, the water for washing purposes must be drawn, and when dirty disposed of in a safe manner, and under [illegible] applied to other parts. A waste channel must be provided leading from the lower end of the bath to the waste-water trenches.

For clothes washing a difficulty may be found in the subsequent drying, and when outdoors drying is impossible, the provision of a tent or shed is desirable. The necessary heat may be supplied by the familiar "devil" or crazier used by watchmen. The disadvantage of coke smoke would outweigh the advantages of the heat of that fuel, but charcoal has been found very successful. To make charcoal, a pit, from 2 ft. to 3 ft. in depth and 4 ft. to 5 ft. in diameter, should be dug. In this a fire is made and fed continually so as to ensure that, as the hot embers sink to the bottom, the pit remains full of fuel. When the resultant embers reach the top of the pit, sufficient fuel should be added to a height of 18 in. above ground level, and the excavated earth covered over the burning mass. I have experimented with several earths and find a fine loamy soil gives the best results, as hard earths do not provide an airtight cover.

End Elevation



Part Side Elevation

Washing Bench.

be available wherever bay washing on the stream itself be permitted. In temporary camps of more permanent character benches are usually provided for ordinary ablutions.

I recently designed a washing-place for 200 men. This was provided with a concrete floor laid to suitable falls to the centre, which consisted of a channel formed in cement. A galvanised-iron roof was provided with sides and back, but no front. The washing benches were of a flat type.

In the open, in view of the impossibility of preventing the ground becoming sloppy, the following arrangement is recommended:—

A bench consisting of a V-shaped trough, with sides not less than 12 in. in width, and fixed to give a fall to one end, not less than 2 in. in 6 ft. On both sides a shelf, not less than 9 in. wide, is fixed level; this necessitates the V-shaped trough being constructed from boards tapering in width to allow a suitable fall to the trough base, while avoiding sloping shelves. A tap is provided at the higher end; a grease pit is necessary below the outlet. When dirty, the water is turned into the trough to discharge into the grease pit, and is subsequently disposed on a series of shallow trenches arranged in pairs for use on alternate days. Local conditions govern the disposal arrangements, and may require secondary and even tertiary filtration; surface filtration is generally preferable to subsoil soakage. A paving of stones or wood gratings, consisting of slate battens 1 in. apart, and ledgered at intervals of 2 ft., should be provided for the men to stand on.

In the absence of wood troughs, canvas may be adapted, but, having been used for soapy water, the canvas cannot again be considered fit to hold drinking water for men or horses. The same conditions must, of course, be observed in respect to bathing in streams as with ordinary ablution.

In the absence of anything more suitable, marquees may be erected, and metal baths provided in canvas cubicles. Care is required in respect to the disposal of the foul water. By excavation in the earth and [illegible] bath can be provided. The water supply may be obtained by damming a stream and diverting the required amount of water, or, if obtainable, from a tap

At the end of twenty-four hours a pit full of charcoal will be obtained. Hard woods are preferable if obtainable.

In the absence of clothes-horses, useful substitutes may be made from wires stretched on posts. Copper or galvanised material should be used for this purpose, as the ordinary iron wire may leave rust marks.

Rural District Councils. According to the annual return, published last Friday, there are 652 rural district councils in England and Wales. The receipts (exclusive of borrowed money) of the councils during the year 1912-13 amounted to £4,962,859, and the expenditure, apart from money received from loans, was £4,902,456, an increase of £53,041. The repayment of interest on loans in England amounted to £533,445, and Wales £60,315. In England the sums repaid for principal and interest on sewerage and sewage disposal works was £290,490, and on waterworks £161,431. The aggregate length of roads under the supervision of the council was 99,963 miles, comprising 5,027 miles of main roads. The average cost per mile of main roads in England was £85 16s., and in Wales £74 5s. On other highways the cost per mile was: England, £25 7s.; and Wales, £15 18s.

Society of Architects: Architectural Competitions.—In order that injustice shall not be done to graduates or students of the society on active service, the council have decided to suspend all the society's competitions for the coming session, and in the case of those on active service to waive the age limit, so that all may start fair when the competitions are resumed in the following session or when the war is over. The council have approved the work done by the holders of the Travelling Studentship and Scholarship during the present session. The holder of the former, Mr. Charles Bell, of Aberdeen, receives £25 and a silver medal, and the holder of the latter, Mr. F. M. Cashmore, receives £10. The scholarship competition this year only produced two entries, probably owing to the war. The designs were not considered of sufficient merit for the scholarship to be awarded, but a prize of the value of £5 5s. has been given to the winner, Mr. Charles Bell, of Aberdeen.

Institution of Civil Engineers.

MR. BENJAMIN HALL BLYTH'S PRESIDENTIAL ADDRESS.

Although Mr. Benjamin Hall Blyth, who on [illegible] has not been the first engineer to occupy the position of president of the Institution of Civil Engineers, he is the first engineer practising in Scotland on whom the honour has been bestowed. Considerably more than half of Mr. Blyth's address was devoted to the development of the Scottish railway systems during the past fifty years—a period which, by the way, corresponds very nearly with the term of the new president's professional life. Some remarks on [illegible] were included in a [illegible] of waterworks, those in Edinburgh, Glasgow and Aberdeen coming in for special mention.

WATER SUPPLY IN SCOTLAND.

Mr. Blyth [illegible] the Local Government Board [illegible] control and took care that adequate supplies of water were provided where they were required, pointed out that much money might be saved, and the water supply of the country conserved, if more combination took place between adjoining burghs and between burghs and counties before any of them were allowed to introduce a new water supply. His view was that it would be far better if a number of places in adjoining districts combined and introduced one large comprehensive supply rather than that each separate place should have an independent supply for itself.

"Take, for instance, my own county of East Lothian," he said. "There every town and village has its own independent supply, with separate reservoirs, separate compensation water and separate lines of main pipes bringing the water from the hills to the various points of supply." He thought it would have been infinitely better, and much more economical, if all these places had combined and had one comprehensive scheme dealing with the whole county.

"Is it," he asked, "too much to hope that in future—and much remains still to be done—the Legislature will take care that this question of combination is duly considered before any supply for a comparatively restricted district is sanctioned?"

Dealing with the question of the quantity of compensation water that should be given off, the president said it seemed absurd that this should be left to be fought out under every little Bill, and it should be fixed definitely by the Legislature. It often happened that the promoters of a scheme—where no landed proprietor had a sufficient interest to oppose it—got off with the provision of far too small an amount of compensation water. This matter was really a national one, and should be settled, not in the interest of any individual proprietor, but of the public at large. When the available sources of supply were yearly becoming more and more scarce, it was essential that adequate provision should be made to secure that our rivers and streams had at all times a sufficient supply of water sent down them.

TRAMWAYS.

The great municipalities of Scotland, the president observed, were keeping pace with the times, and had for many years past been doing much to improve the cities over which they had control. Tramways were to be found in all the principal cities, and in many country districts as well, and these, with the single exception of Edinburgh, were worked on the overhead electric system. In Edinburgh, where the cable had been adopted about twenty years ago, the cost of working was 1d. per car-mile less than that of any other system in the country. Although the cable system was costly to instal in the first instance, once it was installed it was worked far more cheaply than any other system. In Glasgow, where much had been done for the improvement of the amenity of the city, one of the principal works undertaken by the corporation, assisted by adjoining counties, was the purification of the river Clyde.

TOWN PLANNING.

The president, proceeding to refer to the Town Planning Act of 1909, said it seemed to him that corporations, both in Scotland and England, had quite lost their heads with regard to the administration of that Act. No doubt broad streets and roads and large open spaces in towns of all sizes were of great benefit to the people, but surely the provisions of this Act could be, and were in some cases being, carried much too far.

"Take the case of the burgh of Dunfermline, a burgh which has a population of about 28,000, covering an area of 2,032 acres, more than half of which is at the present time unbuilt on. It acquired under the authority of Parliament between 5,000 and 6,000 acres of what is purely agricultural land, and it has completed a town planning scheme for the whole of that area. Unless something very extraordinary happens, this area of ground cannot be filled with houses for more than a century, and yet the corporation are going to spend immediately a very large sum of money in laying out roads and sewers for the town planning of this district.

"Again, take the case of the city of Edinburgh. The corporation own a large area of ground, extending to something like 90 acres, in the neighbourhood of the new cattle markets, available for feuing purposes, and at a recent meeting of the corporation it was decided by a majority that no building to be put up on that ground is to exceed three storeys in height. The streets are to be wide, and several open spaces are being provided, and in Edinburgh, which has some old buildings from twelve to fourteen storeys high, it seems absurd to restrict new buildings on this area to three storeys. If the height had been increased to four storeys it would have meant a saving to the citizens of upwards of £3,000 a year."

These were only two instances, but all over Scotland this Act was being strained to its utmost extent by corporations in order to make provision far in excess of anything needed in the near future.

ENGINEERING MADE EASY.

Mr. Blyth said he would next like to point out to the engineers of the present day how much more easy it was now, from every point of view, to carry out big works than it was at the beginning of the period with which he was dealing.

In questions of construction they had now the benefit of pneumatic and hydraulic pressures, and of electric energy. They used to an enormous extent Portland cement, which was first used, in Scotland at any rate, in 1870, but then only as a lime in which brickwork was set. The first notice he had of it being used for cement concrete was in 1877, when so little was known about Portland cement itself that no tests were specified with regard to it. Then there was the substitution of steel for iron, which enabled larger spans to be built, while preserving the same margin of safety.

In the early days of the period I am dealing with engineers had to specify and supervise the construction of all temporary huts for workmen. Now that was all undertaken by the Local Government Board, and the contractor had to comply with their requirements. In some of his old specifications, after stating the sizes of the houses and the number of cubic feet, &c., to be provided in workmen's houses, the following clause occurred: "Each bed to contain not more than two men, and to be at least 6 ft. long and 4 ft. wide inside." That specification was in use for many years, and, as far as he could make out, up to 1874.

"I am afraid," remarked the president, "the navvies in those days must have been of a smaller size than many we see about us now."

Apart from the mere question of construction, the whole routine office work was much simpler than in the early days.

What had further tended to simplify all engineering works was the standardisation which had been undertaken by the British Engineering Standards Committee. Now, instead of having a long specification with regard to, say, cement or steel, a specification simply provided that these must comply with the requirements of the Engineering Standards Committee.

Ordnance sheets were only just being introduced fifty years ago, and he remembered quite well hearing his father say that he thought the introduction of ordnance sheets would be the ruin of civil engineers, a great part of their work in those days consisting

in surveying and preparing plans of the estates of landed proprietors. Instead of being the ruin of civil engineers, he supposed there was nothing that had tended more to simplify and enable them to carry out their work more efficiently and rapidly than the introduction and use of ordnance sheets.

As these applications meant just the same as in any other trade or profession, the introduction of more machinery and the consequent employment of less personal labour.

REINFORCED CONCRETE.

Turning to the question of the use of reinforced concrete, the president remarked that, while for certain structures that material might have its advantages, it was in many cases used for ordinary construction where stone or brickwork or steel would be much better, and, as far as he could make out, in most cases would be cheaper. That led him to observe that, both as regards particular methods of construction in reinforced concrete adopted by individual firms as well as other constructional and inspecting work undertaken by joint-stock companies, great efforts were continually made to secure the execution of work irrespective of designs which would, in the ordinary course, be prepared by independent professional engineers.

Unfortunately, men who were members or associate-members of the institution were often also members of, or agents or advisers of, those companies, and thus took part in extending the operations of persons who, properly enough engaged in the supplying of materials or erection of structures, sought to include at the same time all the professional functions of advising, designing and supervising.

Further, as they were aware, the institution had set its face rigidly against any advertising for professional advisory work on the part of its members; but while this regulation was adhered to by individual members, companies which contained or were served by members of the institution advertised broadcast for work, frequently using the names of members in the advertisements, and the council felt that members of the institution who were acting for such companies were breaking the regulations that had been made.

This matter was at the present time receiving the most anxious consideration of the council, and it was their intention to take some steps to put a stop to the practice he was alluding to.

ROAD MAKING.

There was, observed the president in conclusion, one matter which was urgently calling for the attention of all engineers. He meant the question of road making, with special regard to the ever-increasing use of motor vehicles.

Many specifications had been proposed up to the present time, but so far he had not seen one that fully met the requirements of all parties concerned. Unless they were to have absolutely separate roads in the country for motor and horse traffic, a specification for the construction of a new road must give due weight to the requirements of each of these kinds of traffic, and a road must not be made so that it was fit for motor-car traffic and useless for horse traffic, or fit for horse traffic and useless for motor-car traffic.

What was wanted was a road with a strong bottom, but with a certain amount of yield in it, and this must be covered with some special bituminous or non-absorbent material very carefully put on, bound together with tar or some other adhesive substance, so as to give an absolutely smooth surface, and minimise the quantity of dust created by the travelling of motor vehicles. He had no doubt that after a few more experiments engineers would be able to construct roads that would give satisfaction to everyone using them.

Electricity and Gas Extensions at Barrow.—At a meeting of the Barrow Council recently the Electricity Committee reported on the agreement with Messrs. Vickers to supply the Barrow shipyard with electricity running to 5,000,000 units per year for three years. This would necessitate increasing the plant at the Barrow electricity works at a cost of £13,000. This scheme was adopted. Certain members took strong objection to the hanging up of a scheme already approved for new gasworks to cost £70,000, the tenders for which had already been received, arguing that capital expenditure should not be curtailed in Barrow, which was so busily engaged in the manufacture of munitions of war. It was agreed to go on with the works.

REINFORCED CONCRETE IN MUNICIPAL ENGINEERING WORKS.

On Monday evening last the third of a series of public lectures was delivered by Prof. E. R. Matthews, Assoc.M.Inst.C.E., Chadwick Professor of Municipal Engineering in the University of London.

Taking for his subject "Reinforced Concrete in Municipal Engineering Works," Prof. Matthews remarked that the material was not a new one. Its discovery was claimed by the Germans, who, however, claimed many things which they had no right to do. Actually it was used 100 years B.C. by the Romans in the covering of the roofs over their large tombs. The reinforcing material they employed consisted of bronze rods, but the concrete, they might be sure, was very poor compared with what we used to-day. About sixty years ago the French people took up the material very earnestly, and at the Exposition of 1867 there were a number of exhibits of reinforced concrete work. Since then the Germans had used a great deal of it. But America had been the leader; no country had used more, and the material was growing in favour as a result of the experience which had been gained. It had been used there for all sorts of purposes—often when it was inadvisable.

British engineers seemed to be rather conservative in their ideas with regard to adopting any new material, and it was some time before they looked upon reinforced concrete with favour; municipal engineers were now, however, commencing to use it a good deal. Some isolated cases of corrosion of the reinforcement had resulted in certain engineers refusing to employ it. He might say, however, that some years ago he carried out tests with a number of blocks of reinforced concrete about 1 ft. cube in size. Some of these were put in the sea at low water, others in fresh water, and a third set were left in the open air, and in no case did he find the least corrosion; in fact, reinforcing bars which, when put into the concrete were covered with red rust, when taken out were found to be quite bright. He once had occasion to take off the roof of an underground lavatory which leaked badly. The steel joists of this were embedded in concrete, but the bars showed no signs whatever of corrosion. He had found the same thing in a sea wall which he had to repair, and he thought such experiences tended to strengthen one's confidence in reinforced concrete. Corrosion did not bother him a bit, if the concrete was properly mixed and the reinforcing bars were thoroughly covered. He wished at the same time to utter one word of warning. Cinder concrete must not be used for reinforced concrete work, his experience of that being that, owing to the chemical action that was set up, corrosion occurred.

Prof. Matthews went on to refer to the use of reinforced concrete in the construction of sewers and aqueducts. Proceeding to deal with its advantages, he remarked that no material could be constructed more rapidly, the cost of maintenance was low, expansion and contraction were practically the same, and, of course, the concrete did not deteriorate, but increased in strength with age. He hoped the time would come when the municipal engineers of this country would adopt it more extensively, because he believed it was possible by its use to effect a saving of from 20 to 30 per cent. Touching upon its employment for purposes of sea defence, he said that, generally speaking, he did not recommend its use in that connection. In many other directions, however, he strongly advocated its employment.

Town Planning Institute.—A meeting of this body arranged for November 13th has been postponed. At the meeting in question, Mr. Percy T. Runton, A.R.I.B.A., was to have read a paper entitled "The Industrial Village."

Manchester's New Library.—A new public library at Chorlton-cum-Hardy was opened on Wednesday. It is the outcome of a gift of £5,000 by Mr. Carnegie, and has been erected in accordance with the designs of the city architect, Mr. Henry Price.

Proposed New Road in Durham.—The Durham University authorities have granted 4 acres of land to the Durham Corporation for the purpose of making a road between Durham and Shincliffe. The scheme is to be carried out in the event of distress arising out of the war.

Traffic on the Great Western Road.

A CHISWICK CENSUS.

A census of the traffic passing over the High-road, Chiswick, between the hours of 6 a.m. and 10 p.m., has been taken by the engineer and surveyor to the urban district council, Mr. E. Willis, ASSOC.M.INST.C.E., on the lines laid down by the Road Board in connection with the classification of roads. The statistics obtained are as under :—

Classification of vehicles.	Assumed average weight. Tons.	Number each day of 16 hours.							Total in seven days.		Average number per day.	Average weight per day.
		1st July.	2nd July.	3rd July.	4th July.	5th July.	6th July.	7th July.	Number.	Weight in tons.

The Abnormal Development of Coventry.

SOME OF ITS TOWN PLANNING AND HOUSING PROBLEMS.*

By J. E. SWINDLEHURST, [illegible], City Engineer and Surveyor, Coventry.

In the year 1909 Coventry [illegible] is locally known as the "cycle boom." This continued [illegible] ment took place. Following this, in 1908, the author was engaged laying out a park and other works as "relief works" for the unemployed. This latter [illegible] depression in the city; yet, notwithstanding this, there were very few empty houses, and shortly after, when

MR. J. E. SWINDLEHURST, M.INST.C.E.

the introduction of new industries led to greater demands for labour, housing accommodation was severely taxed. At the census of 1901 the population of Coventry was 69,978. At the census of 1911 the population was 106,349—an increase of 52 per cent for the ten years, or at the rate of 3,639 persons per annum. The population at the middle of the present year is estimated by the medical officer of health to reach 120,000. The number of inhabited houses at the 1911 census was 23,042, or at the rate of 4·6 persons per inhabited house. The estimated number of inhabited houses at the present time is 26,250. The last extension of the city boundary was in 1899, so that the above increase has not been due to any cause of this nature.

A gradual but continual influx of new population into a town where the number of houses has for some years been little, if any, in excess of the normal requirements invariably leads to development in house building. In the case of Coventry, during the last several years, the conditions have not been that of a normal development due to a progressive town of this size; they have in every sense been abnormal, while, as regards house building, the utmost efforts of private enterprise have at no time kept pace with the demands. This is evidenced by the fact that a very large number of men working in Coventry are compelled to live in the surrounding towns, while almost every edition of the local Press contains offers of premiums for houses. Consequently, extensive areas of land in proximity to the built-up area of the city have been brought into the market, laid out as streets, and buildings erected. . . .

The total number of houses erected and completed in the city during the period from January 1, 1900, to April 30, 1914, is 11,394. Of this number, 8,106 houses have been erected and completed on new estates which have been developed during the period named, and in addition 474 houses are in course of erection on such estates. It will be seen from the above that 3,288 houses have been erected and completed in other parts of the city, on sites in existing [illegible] , and on [illegible] to 1900, but which had not been built up.

It is the object of the author to review, on very broad lines only, certain conditions which have prevailed in this abnormal increase of the city, together with the special problems as regards estate development, buildings, and housing conditions which such a state of things entails upon the local authority. . . .

Unlike many towns, where practically the whole of the land belongs to one or two large landowners gifted with broad and philanthropic views, the land in Coventry belongs to numerous owners. Such conditions (in the absence of ample powers) have not rendered the position less difficult from the point of view of arranging a systematic and comprehensive plan for dealing with the land as a whole. Following upon the demand, land for building purposes within the city has come into the market at constantly advancing prices, and sites varying from 1 or 2 acres in extent to over 54 acres have been dealt with as separate building estates.

The laying out of these estates by landowners, but more especially by land speculators, was proceeded with immediately the plans were approved. In some cases the estates have been entirely built up, in others the streets have been laid out and formed, the sewers constructed, and a considerable number of houses erected; yet these are not entirely built up. In either case the Housing, Town Planning, &c., Act cannot, for practical reasons, be made operative.

The degree of control in the laying out of estates and the erection of buildings, so far as the governing authority is concerned, is, of course, ultimately comprised in the legal powers they possess. The local by-laws in force in Coventry are practically the model form of by-laws issued by the Local Government Board. Under these by-laws streets are required to be 40 ft. in width; the distance at the rear of houses must extend laterally for the full width of the house for a depth of at least 20 ft., and have a minimum area of 300 super. ft. All habitable rooms are required to have a height of 9 ft. and a capacity of not less than 900 cub. ft.

The Coventry Corporation of 1900, *inter alia*, empowers the corporation to prohibit cul-de-sac streets, and also requires, except with the consent of the corporation, the construction of intersecting streets at a distance of not more than 150 yds.

Prior to the Housing, Town Planning, &c., Act becoming law, the powers possessed by the local authority were altogether too limited to enable any comprehensive and far-reaching scheme to be put into force as regards town planning. This being so, it has been the special care of the authority, in all cases, to endeavour to obtain such conditions in the laying out of new estates as were compatible with a wide view of the whole of the surroundings. It has rarely happened that the estate plans as first presented have, in fact, been approved in that form. In some cases, as was inevitable, the pecuniary interests of the estate or building owners conflicted with the interests of the community. Whenever this has been the case we have endeavoured, by negotiation, moral suasion, and in some cases by payment, to effect improvements, which in nearly every case have resulted in satisfactory arrangements being made. This, after all, is the true spirit which the Town Planning Act enforces throughout its whole extent, which is still further emphasised by the Regulations, and is, moreover, a principle which has been applied in this city for many years in difficult circumstances with good results.

Such a policy has resulted in single estates being so laid out as to form part of a comprehensive lay-out of areas much larger than itself. In some few cases the author has succeeded in obtaining certain restrictions in the laying out of the land before this came into the hands of the speculator. Whenever it appeared desirable that a proposed new street should follow a certain line, it has almost invariably been secured, while as regards streets which were likely to be through traffic routes in any particular district, it has been arranged for such streets to be of greater width than the by-laws required. These traffic streets

* From a paper read at the annual general meeting and conference of the Institution of Municipal and County Engineers at Cheltenham.

be continued to the boundaries of such estate, or the space reserved, so as to enable the same line to be maintained on the adjoining estate. Considerable attention has also been given to the important detail and wherever it has been possible to do so we have induced the builders to set back the houses at these points in all important streets. In many streets trees have been planted on the footpaths at the expense of the estate owners.

ADAPTATION OF ROADS.

abutted on existing old highways, either main roads or roads more or less rural in character. Coventry is fortunately placed in having reasonably wide main roads converging to the city from almost every direction. It is only when these roads actually reach the old parts of the city that they unfortunately lose their wide character and become merged in the narrow streets. Every opportunity has been taken to widen and improve these main roads along the frontage of new estates.

The old rural roads were very different, usually about 20 ft. wide, or less. Many of the new estates have a considerable frontage to these roads, and in dealing with them the practice has been as follows: In all cases where a development seemed even likely to take place, or isolated buildings were contemplated, the author prepared a plan and section of the entire length of the existing highway. The possible necessities of the road as regards traffic, due to the future development of the district, were considered, its ultimate width determined, and improvement lines laid down. This was done in many cases some years before the necessity for dealing with the particular road became operative. Upon plans for a new building estate, or the erection of new buildings abutting on such roads, being presented, advantage was taken of this, and by negotiation and arrangement the estate owners were induced to conform to the improvement lines, and in many cases also to substantial alterations in the levels.

Thus these old highways, wherever developments have taken place, have been widened and improved partly at the cost of the corporation and partly at the cost of the person laying out the estate, the width now being between 40 and 60 ft. . . .

TYPE OF BUILDINGS ERECTED BY PRIVATE ENTERPRISE.

The type of dwelling which appears to be most in demand, and which has been mostly provided, is a self-contained house with a frontage varying from 12 to 15 ft., and provides parlour, kitchen, scullery, out offices, and three bedrooms. These houses are built in rows, the depth of the site being about 90 ft. as a rule, and in most cases the houses are set back from the street line 6 ft. and over. In addition to this, houses having only two rooms on the ground floor and two bedrooms have also been provided in considerable numbers. Many other types of houses of greater frontage and larger rooms, to let at higher rentals, have been extensively built.

As regards the provision of baths, it is found that about 15½ per cent of the new houses have been so provided. In all cases separate water-closet accommodation, with a covered dustbin to each house, has been provided, while the whole of the estates have been sewered on the duplicate system.

In respect to sanitary provisions generally, it may be accepted that as regards house drainage, disconnection, ventilation, dampcourse, &c., these have been carried out strictly in accordance with the by-laws and the most modern requirements. . . .

The average accommodation of houses under the several rentals may be taken, generally speaking, to be somewhat as in the following table [see next column].

Rent, including rates.	Accommodation.	
	Ground floor.	First floor.
5/3 to 5/11 ..	Living room, 12 ft. × 11 ft. 4 in. Scullery, best × 9 ft. 6 in. Pantry, coal-cupboard and w.c.	Bedroom 12 ft. × 11 ft. 4 in. „ 10 ft. × 9 ft. 6 in.
6/- to 6/11 ...	Parlour, 12 ft. × 12 ft. Living room, 12 ft. × 10 ft. 6 in. Scullery, 9 ft. × 9 ft. 6 in. Coal-house, pantry and w.c.	„ 12 ft. × 12 ft. „ 12 ft. × 10 ft. 6 in.
7/- to 7/11 ...	Parlour, 12 ft. 6 in. × 12 ft. Living room, 12 ft. 6 in. × 11 ft. Scullery, 9 ft. × 8 ft. Pantry, coal-house and w.c.	„ 12 ft. × 12 ft. „ 12 ft. × 11 ft. „ 13 ft. × 8 ft.
8/- to 10/- ...	Parlour, 11 ft. 6 in. × 11 ft Living room, 12 ft. × 11 ft. 6 in. Scullery, 12 ft. × 9 ft. Hall, pantry, coal-house and w.c	„ 14 ft. × 11 ft. „ 12 ft. × 11 ft. 6 in. „ 12 ft. × 9 ft. Bathroom In some cases no bathrooms are provided, whilst in others there are only two bedrooms and a bathroom.

In the case of houses of a rental, including rates, of over 10s. per week, the rental is, of course, governed by the accommodation provided, and the locality in which the houses are situated. . . .

Notwithstanding the fact that there has been a continuous demand for houses, there has been a serious falling off in the houses erected by private enterprise. . . . The author believes that the primary reasons for this falling off in building appears to be twofold: (1) the increased cost of the materials and labour, builders have found it increasingly difficult to build houses which can be sold at a profit, while (2) investors appear to have become reluctant to pay more for the same type of house than was demanded a year or two ago. . . .

The conditions which now prevail in Coventry will, it is feared, render the difficulty more acute, because not only will the work of the Sanitary Committee be made more difficult in dealing with overcrowding and unfit houses, but with a continuance of good trade the increasing scarcity of houses may seriously affect the commercial expansion of the city.

Such a state of things has naturally received full consideration by the governing authority, and it is thought that possibly, under all the existing circumstances, the best and quickest solution will be found by revising the existing by-laws relating to new buildings. It is proposed in this revision to effect two [illegible]

(1) To reduce the height of habitable rooms from 9 ft., as at present, to 8 ft., and to permit rooms in the roof to be 5 ft. 6 in. high at the eaves, and 8 ft. in height over two-thirds of the area.

(2) To dispense with the provision of a disconnecting chamber on the house drains to each house as at present, and to provide that one disconnecting chamber may serve for not more than twelve houses if the length of the common drain does not exceed 300 ft.

The by-laws as regards sanitary and structural provisions will be modernised and extended, but not relaxed. If these modifications are authorised to the extent indicated, it is hoped that the cost of cottage building will be reduced accordingly, and that this may give a fresh impetus to private enterprise in this respect.

COVENTRY CORPORATION HOUSING SCHEMES.

The Coventry Corporation have on one estate—viz., Narrow-lane—already erected a considerable number of three and two bedroomed cottages. The scheme for this site, which is now approaching completion, comprises the erection of 180 cottages, 45 of which have two bedrooms, and 135 with three bedrooms. The accommodation provided in the three-bedroomed cottages consists of a living-room, 14 ft. 6 in. by 12 ft. 9 in., scullery-bathroom 9 ft. 7 in. by 8 ft. 9 in., pantry, coals, water-closet, and three bedrooms with an area of 123 ft., 107 ft. and 101 ft. super. respectively. The two-bedroomed cottages are similarly planned, but the frontage is 12 in. less, and in this case the bathroom is arranged on the first floor.

The scheme was commenced in 1908, and has been carried out in sections, the cost per three-bedroom cottage, exclusive of land and street works, varying from £198 to £226, as before mentioned, or including land and street works £226 to £254. The difference in cost between the three and two bedroomed cottages has worked out at about £10 less for the two bedrooms.

The rents charged are 6s. per week for a house with three bedrooms, and 5s. 6d. per week for the two-bedroomed houses, these rents being inclusive of rates. Four shops are also included in this scheme, but these are not yet completed, so that the rents cannot be given.

In addition to the above, twenty-two dwellings on

the dual-flat principle were erected in 1908. These dwellings consist, on the ground floor, of living-room 14 ft. 6 in. by 11 ft., bathroom-scullery 11 ft. by 6 ft. 5 in., [illegible] and one bedroom 11 ft. by 11 ft.; on the first floor the accommodation is similar. The cost of a single tenement was £150, etc., including land and sewers, £182, and the rent charged is 4s. 3d., inclusive of rates. The total cost of the above scheme [illegible] have now been issued as regards forty-eight houses in the above scheme and the twenty-two tenements. It is found that at the rents charged the scheme has been self-supporting, including the repayment of sinking fund and interest. It is established in Coventry that a sum equal to 40 per cent of the gross rentals is required for all outgoings, exclusive of sinking fund and interest.

Schemes for the erection of additional dwellings to comply with the Local Government Board requirements in respect to the Leicester-street rehousing, together with additional dwellings, have been approved by the city council, and are awaiting the approval of the Local Government Board. These schemes comprise the erection of 122 cottages known as type "B"; fifty-two two-bedroomed tenements, and twenty-four one-bedroomed tenements, both the latter being on the dual-flat principle. The cost of these schemes is estimated at £40,280.

The houses to be demolished in the Leicester-street improvement scheme consist of very poor-class dwellings occupied by poor people. The rents paid for the existing houses vary between 1s. 6d. to 6s. per week, but 68 per cent of the houses are let at 4s. and under per week. To meet a question of this nature, and to provide houses for the poorest, raises at once the real crux of the housing problem. The author has endeavoured to keep this object in view so far as is practically possible, in the dwellings it is proposed to erect. To accomplish this it has been assumed that the suggested alteration in the building by-laws will be sanctioned, and the plans are prepared on this basis.

The estimated cost of the several types of dwellings proposed to be erected is:—

Cottage (type B), £185; with land, streets and sewers, £214 each; two-bedroomed tenements, £150 each; with land, streets and sewers, £184 each; one-bedroom tenements, £125 each; with land, streets and sewers, £158 each.

The rentals necessary to make this scheme self-supporting, including repayment of sinking fund and interest, will require to be: Cottages, 5s. 9d. per week; two-bedroomed tenements, 5s. per week; and one-bedroomed tenement, 4s. 3d. per week.

If the sinking fund were entirely omitted it would be possible to reduce these rents by 6·8d., 5·7d., and 4·8d. per week, for each type of dwelling respectively. The scheme, on the basis of five persons per three-bedroomed house, four persons per two-bedroomed tenement, and two persons per one-bedroomed tenement, which is the basis laid down by the Local Government Board, will accommodate 866 persons.

In addition to the above the author has prepared a further scheme which is at present under consideration for the erection of 118 cottages, type "A": Estimated cost, exclusive of site, &c., £184; 106 tenements with two bedrooms, estimated cost, exclusive of sites, &c., £154; and 34 tenements with one bedroom, estimated cost, exclusive of site, &c., £126, both the latter being on the dual-flat principle. The total estimated cost of this scheme, including land, &c., and buildings, is £54,000. The rentals necessary to make this scheme self-supporting, including repayment of sinking fund and interest, will require to be: Cottages, 6s. 6d. per week; two-bedroomed tenements, 5s. 7d. per week; and one-bedroomed tenement, 4s. 9d. per week. If the sinking fund is omitted, it would be possible to reduce these rents by 10d., 7d. and 6d. per week for each class of dwelling respectively. . . .

The Housing Committee do not seek to make a profit on the housing schemes, but it is insisted that these shall be self-supporting.

PROVISION OF OPEN SPACES.

The greatest development of new estates has taken place in the north, east, and south-west of the city, and these localities are within easy reach of one or more open spaces. Notwithstanding this, the corporation has recognised that other districts were not so well served in this respect. In recent years additional open spaces and recreation grounds have been secured, and these have been laid out by the author. . . .

TRAFFIC ON CENTRAL STREETS.

A few years ago the streets were reasonably sufficient for the traffic conditions, but in recent times such is the increased volume of traffic that at least nine of the most important business streets have become more or less congested. This is a difficulty which every year is becoming more acute, so much so that it is forcing itself upon the serious consideration of the authority. . . .

It is decided that a combination of street widening and the opening out of new streets is the correct solution. . . . The whole question of street improvement is being considered comprehensively by the corporation, and several important schemes and estimates of cost, &c., for new lines of streets and street widenings prepared by the author are now under consideration. . . .

OTHER MUNICIPAL ENTERPRISES.

The special works upon which the author has been engaged in this connection comprise: Extension of electricity works; extension of the sewerage system; resewering of districts; surface-water system of sewers; extension of sewage disposal works; refuse destructor; hospital extensions; new mortuary; fire stations; new general works depot; new streets, widenings, and improvements; additions to baths; new slipper baths to outside district; three branch libraries; three new road bridges, &c.

In addition to these, many other works of importance are in hand by the author, including two new covered service reservoirs; reconstruction of city system of sewers; 2 acres of bacteria beds at the sewage farm; underground conveniences; new thoroughfares in centre of city, street widenings; two new swimming baths; housing schemes; and a great number and variety of other less important work consequent upon the increased public needs. The increase and nature of the traffic upon the streets at the present time also demand greater expenditure and new methods of construction. In addition to the foregoing, the corporation have in recent years built new gasworks, secured an additional water supply, and are at present erecting new municipal buildings, while six new schools have been built, and others are contemplated, including a new technical institute.

AREAS TO BE TOWN PLANNED.

The very great desirability of embracing the whole of the undeveloped land in the city in town planning schemes is very prominent in the view of the governing authorities. The author has recommended that an area of 976 acres shall be included in the first application, and the city council has authorised this to be done. It is the intention forthwith to embrace the whole of the remaining undeveloped areas within the city boundary, and such further adjoining areas as are deemed advisable in a comprehensive town planning scheme.

There are two estates, comprising a total area of 35 acres, being laid out on town planning lines in this city, and in connection with these the corporation have devoted much time to the formulation of certain provisions which it is intended shall form the basis of their town planning schemes on a wide scale. These provisions will provide that on areas where the number of houses does not exceed fifteen to the gross acre, subject to certain conditions, the widths of non-traffic roads may be reduced to not less than 24 ft. in width, and, further, it is intended to give more latitude with reference to the construction of such roads. In such lay outs building lines will be required to be set back at least 35 ft. from the centre of the roads.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

THE MONTHLY PREMIUM.

The premium for October is awarded to

Mr. P. HARRISON,
Hazle Dene,
Sadler-street,
Middleton, Lancs.

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

433. Mechanics.—Show how to find the periodic time of one complete vibration in a case of simple harmonic motion, and give a proof of the necessary formula.

435. Damp Prevention.—Show by sketches three methods of preventing moisture in the soil from rising into a brick wall: (*a*) an ordinary 14-in. wall, (*b*) a 16-in. cavity wall, (*c*) an 18-in. basement wall.

436. Ventilation.—What effect has (*a*) the breathing of animals and (*b*) the combustion of fuel upon the purity of the atmosphere? (T. R.)

437. Underpinning.—A carved column in a church is showing signs of settlement. Describe, with sketches, the method of timbering and underpinning it. (L. C. B., *Clevedon.*)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

432. Ventilation.—What is the distinction between "natural" and "artificial" ventilation?

By natural ventilation is understood the movement of the air through a room due to the different densities of the air within and that without. By artificial ventilation is meant the application of some force or forces either to force in fresh air (the plenum system) or to expel the foul air (the vacuum system). *Natural Ventilation.*—As the air within is always warmer, more or less, and has a tendency to rise, it is desirable that the movement should be effected without causing unpleasant draughts. To admit of this, the cubic space per head for each occupant should not be less than 1,000 cub. ft., permitting an entire change of the air of the room not less than three times an hour. An inlet of 24 sq. in. clear area and outlets to the same amount are required for each person. The inlets should be above the heads of the occupants, and not nearer the ceiling than can be avoided. They should be so constructed as to direct the incoming air upwards, and should be fitted with valves so that when, in consequence of great differences of temperature, there is a much increased current of air, its volume may be reduced by reducing the area of the inlets. Inlets may with convenience be placed so as to admit air from a passage or corridor, when it will be somewhat warmer than the outer air and nearly as pure, and the tendency to unpleasant draughts will be reduced. Outlets should be in or as near to the ceiling as possible. *Artificial Ventilation.*—With this system, as above stated, the air is propelled from or drawn into the room at a comparatively high velocity. (W. D., *Dudley.*)

434. A Question in Statics.—A light rod, of length 3 ft., whose weight is neglected, has equal weights attached to it, one at 9 in. from one end and the other at 15 in. from the other end. If it be supported by two vertical strings attached to its ends, and if the strings cannot support a tension greater than the weight of 1 cwt., what is the greatest magnitude of the equal weights? (H. P. M., *Towyn.*)

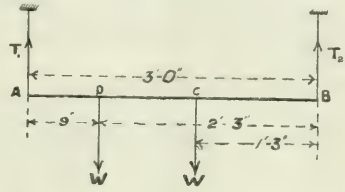
[This question is ambiguous, and correspondents have interpreted it in two ways—viz., the maximum tension of *each* string being 1 cwt., and the maximum tension of *both* strings being 1 cwt. An example of each solution follows.—Ed.]

Fig. 1 shows the arrangement and disposition of the forces acting. AB represents the light rod.

Let T_1 and T_2 = Tensions in the vertical supporting strings, the magnitude of each of which is not to exceed the weight of 1 cwt,

and let W = Each of the two equal weights.

We wish to evaluate W.



From an inspection of the figure it will readily be seen that, since equilibrium obtains, the upward forces exactly counterbalance the downward forces *i.e.*,

$$T_1 + T_2 = 2W \quad . \quad . \quad . \quad . \quad . \quad (1)$$

It will also be abundantly clear that, since the weights are of equal magnitude, and that the tension string T_1 is nearer the weight W (9 in. away) than the tension string T_2 from the other weight W (15 in. away), and since there are no other forces acting, the magnitude of T_1 must necessarily be greater than the magnitude of T_2. But we are given that the maximum weight each string can support is 1 cwt.; hence the maximum value of T_1 is 1 cwt., and of T_2 is less than 1 cwt.

Now, taking moments about the end B of the rod, and paying proper attention to sign, gives:—

$$T_1 \times AB = W \times DB + W \times CB$$

$$i.e., \quad T_1 \times 3^1 = W \times \frac{9^1}{4} + W \times \frac{5^1}{4}$$

$$\therefore \quad 3T_1 = \frac{9W}{4} + \frac{5W}{4}$$

$$\therefore \quad 12T_1 = 9W + 5W = 14W$$

$$i.e., \quad T_1 = \frac{14}{12} W$$

$$\text{or} \quad W = \frac{6}{7} T_1$$

But the maximum value of T_1 is 1 cwt.

$\therefore$ The maximum value of $W = \frac{6}{7}$ cwt.

Hence, the maximum value of each weight is $\frac{6}{7}$ cwt.

It is interesting to note from equation (1) that :—

$$T_1 + T_2 = 2 \cdot \frac{6}{7} = \frac{12}{7} \text{ cwt.}$$

$$i.e., \quad 1 + T_2 = \frac{12}{7} \text{ cwt.}$$

$$i.e., \quad T_2 = \frac{5}{7} \text{ cwt.}$$

Therefore the right-hand supporting string need be only $\frac{5}{7}$ the sectional area of the left-hand supporting string, provided it is made of precisely the same material, and can therefore withstand the

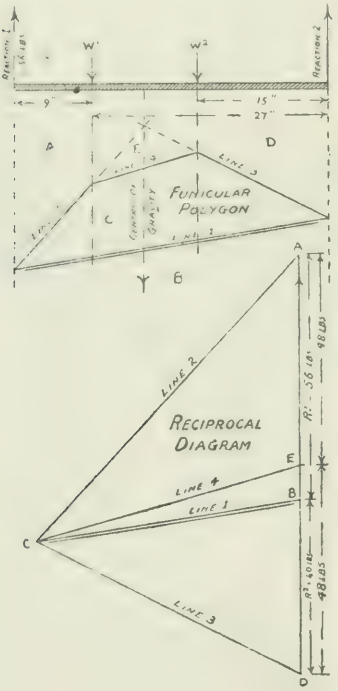
[illegible] It is usual to subtract [illegible] therefore, since T, was the only value, we could assume it became essential to take moments about the end B. The choice of the maximum value for the correct tension string, and the choice of ends about which to take moments are the sources of [illegible]

The weight of the rod being neglected, the the greatest weight which may safely be applied at the centre is 1 cwt. (112 lb.). It is therefore [illegible] weight of 56 lb., and the two weights which are to be placed on the rod must not cause a greater strain than that amount on either of the two strings, or the maximum reaction will be overcome and the string will break. If the rod be drawn to scale, and the points of application of the equal weights marked on it, the centre of gravity can be found, being half way between the two weights. The string which is situated nearest to the centre of gravity will be subject to the greatest strain, and to obtain the greatest magnitude of the equal weights this strain must be taken at 56 lb., which equals the maximum reaction of the string.

The formula for ascertaining the reaction of the weights is:—

$$R_1 = \frac{W^1 \cdot D + W^2 \cdot d}{L}$$

Where W and W[illegible] weights D and d distances from respective weights to the opposite support,



and L=total length. But R_1 is known, and the weights are not known, therefore the formula will have to be reversed—

$$W_1 + W_2 = \frac{R_1 + R_2}{D + d} \times L \quad \text{or} \quad W_1 + W_2 = \frac{56 + 56}{27 + 15} \times 36$$

= 96 lb. As the weights are equal 96 ÷ 2 = 48 lb, therefore 48 lb. is the magnitude of each of the weights.

To prove this take the first formula and substitute the figures—

$$R_1 = \frac{(48 \times 27) + (48 \times 15)}{36} = 56 \text{ lb. Reaction 1}$$

To find the reaction 2 substitute for distances 9 in. and 21 in., and it will be found that the reaction is 40 lb. on the other string.

To work the problem graphically, which is much more simple, draw [illegible] reaction 1 [illegible] as shown on reciprocal diagram. Take any point C and join AC and BC.

Draw the line 1 on the original diagram and parallel to BC, and project the lines downwards from the end of the rod, giving the terminations of line 1. From one end of this line draw line 2 parallel to AC on reciprocal diagram until it cuts the line of the centre of gravity. From this point draw line 3 and complete the funicular polygon by line 4, drawn from the point of intersection of line 2 and weight 1 projected to the intersection of line 3 and weight 2 projected. Transfer lines 3 and 4 to the reciprocal diagram, shown by CE and CD. Letter the spaces on the original diagram, and it will be found by scaling off the line AE on the reciprocal diagram that the weight 1=48 lb. It will also be found that weight 2=48 lb.; and the reaction 2 is shown to be 40 lb. The mathematical method is seen to agree with the graphical method, proving the accuracy of the result. (P. H., *Middlesex.*)

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Do we not all deeply regret the death of Mr. W. B. Bryan, the chief engineer of the Metropolitan Water Board, and shall we not all reverence the memory of a man who did so much to improve the water supply of London, not only as engineer to the Water Board, but also as engineer to the East London Waterworks Company? Cannot those of us who recollect the condition of that company before Mr. Bryan took office say with truth that he was a public benefactor as well as a great engineer?

* * * *

Is it not excellent reading to see in the last issue of the Royal Automobile Club *Journal* the result of the War Office and Admiralty appeal to members of this club to place themselves and their cars at the disposal of their country? Is it not remarkable that, at a few hours' notice, the club was able to supply no fewer than eighty-seven motor cars for various purpose? Who can say now that motorists are selfish people?

* * * *

What are local surveyors and building inspectors doing to ascertain if there are any concrete floors, suitable as platforms for heavy guns, existing in this country, and what steps are they taking to inform the proper authorities?

* * * *

Is it a fact that in planning warehouses, hospitals, and public institutions of all kinds, architects and engineers are now designing and carrying out on a large scale installations by which the whole of the interior can be periodically cleaned by means of the vacuum process, and is not this a very considerable advance in "domestic" sanitation?

* * * *

What do surveyors think of the reproof administered by the Special Committee of the Institution of Civil Engineers on Practical Training of Engineers to those municipal authorities who by their short-sighted policy prevent their surveyors from taking premium pupils?

* * * *

What is the evident inference to be drawn from the statement that during the past twenty-five years the Germans have so designed and erected all their public schools that they could be made available at any time to serve as military hospitals? Why should this precaution have been taken in a country which desired to live at peace with its neighbours?

* * * *

When will the question of the liability for extraordinary traffic become less of a legal tangle than it is at present? Would it not have been supposed that after all the numerous cases that have gone through the law courts there would have been sufficient judgments given to guide in some measure the necessary procedure and clear the ground for fights on a straight issue?

The Surveyor
And Municipal and County Engineer.

Have any of the magnificent boulevards laid out by Mr. Brodie in Liverpool been named after him? Or is it a fact that these boulevards or avenues are called almost exclusively after the names of members of the corporation?

* * * *

Would it not be very helpful if the Road Board could now issue some report on the best method of dealing with the surface of roads subject to heavy, medium, and light traffic? Should not the experience now gained by their officers enable them to issue even a tentative report on this subject? Is it not possible that there may be some highway engineers who are so wedded to some particular form of road construction that they cannot be induced to try some other and perhaps better and more economical method?

* * * *

Is the war responsible for occasional lapses of memory? Otherwise how can it be accounted for that in the last issue of "Things One Would Like to Know" your contributor referred to the non-issue of the "Standard Specification for Road Stones," when it had already been issued?

THE TRAINING OF MUNICIPAL ENGINEERS.

Invited to express his opinion as to the views set out in a letter on this subject which appeared in THE SURVEYOR of last week (p. 524), Mr. John S. Brodie, borough engineer and surveyor of Blackpool, writes:

"I have to say that I entirely agree with the evidence given by Mr. S. S. Platt and Mr. J. A. Brodie before the Special Committee of the Institution of Civil Engineers on behalf of the Municipal Engineers' Section of the institution. My system of taking pupils has been practically the same as theirs, and the conditions that pupils shall not only matriculate, but must use their best endeavours to graduate in an engineering college has resulted in my having had comparatively few pupils. But then, I think, this is a case where 'quality is much better than quantity.'"

Other letters on this subject, received yesterday, will appear next week.

Society of Architects.—Mr. E. C. P. Monson, F.R.I.B.A., will deliver his inaugural address as president at the opening meeting of the session on Thursday next, the 12th inst. The chair will be taken at 7.30 p.m.

PRO PATRIA.

[NINTH LIST.]

We present herewith a ninth list of municipal engineering and sanitary officials who are taking part in the war, and shall be glad to hear of other cases within the knowledge of our readers.

Cheetham, Dr. W. H., medical officer of health, North Riding of Yorkshire, Yorkshire Hussars.

Coales, H. W. (son of Mr. Herbert G. Coles, ASSOC.M.INST.C.E., engineer and surveyor to the Market Harborough Urban District Council), engineering assistant, Birmingham, Tame and Rea District Drainage Board, 5th Battalion Leicestershire Regiment (Territorials), under orders for the front with the North Midland Brigade.

Davies, A. T., V.D., county surveyor of Salop, Major, 4th King's Shropshire Light Infantry.

Dent, Neil, assistant, borough engineer's department, Nelson, Royal Naval Division, Oxney Bottom Camp, Ringwould.

Duesbury, P. E., assistant borough surveyor's department, Derby, North Midland Field Artillery.

Hall, H., county surveyor's department, North Riding of Yorkshire, 4th (Reserve) Battalion, Yorkshire Regiment.

Norster, T., engineer-in-charge, County Hall, Northallerton, Royal Navy chief engine-room artificer, H.M.S. *Hermione*.

Oliver, T. V., assistant, engineer and surveyor's department, Tamworth Rural District Council, Royal Engineers.

Warr, G. W., surveyor to the Steyning East Rural District Council, National Reserve.

Whitby, John A., assistant surveyor to the Lower Bebington Urban District Council, Cheshire Company, Royal Engineers (Territorials).

Mr. Beloe, of the British Westrumite Asphalt Company, Limited, has joined the Royal Engineers, for active service.

Mr. Albert Lowrie, assistant secretary, Roads Improvement Association, is serving with the 1st City of London, Army Service Corps.

The November issue of the *Journal* of the Royal Sanitary Institute contains a long list of Fellows, members and associates of that body in His Majesty's Forces.

Mr. Reginald Ryves, ASSOC.M.INST.C.E., has been given a commission in the First London Divisional Engineers. Although only just over forty years of age, Mr. Ryves has had a wide and varied engineering experience, which commenced in the office of a well-known railway engineer. From railway work he transferred his attentions to water engineering, and was for some time engineer-manager to the Cartagena Waterworks Company. Two years after leaving Spain he was appointed Acting Professor of Civil Engineering at the Government Engineering College, Madras, and filled other important posts in the Public Works Department before returning to England, owing to ill-health, in 1910. Since that date his many contributions on the subject of roads have made his name a familiar one to the readers of this journal.

Preliminary Studies in Bridge Design.—This little book,* a reprint of articles which appeared in THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, is intended as the first of a series of similar volumes which, taken together, will form a treatise on the design of ordinary highway bridges of moderate spans. This first volume goes further back in the evolution of the bridge than do most treatises, and considers the bridge in its essential elements, that is as the means of providing a crossing for man and beast across a watercourse. The bridge engineer is apt to forget this primary purpose and to consider his bridge merely as a framework or a carrier of stresses. Mr. Ryves, in a refreshingly original manner, has emphasised the necessity for studying natural and economic predispositions, one might say, of the bridge site, with a view toward producing, not the best type of bridge, but the best method of getting the river and the traffic across one another. . . . —*Engineering News*, New York.

Law Notes.

Edited by J. B. Reigster Conder, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries which should be written legibly on foolscap paper, on one side only, should be addressed to "The Law Editor," at the office of The Surveyor, *accompanied by the writer's name and address. All correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

Overflowing Cesspool.—"W. F. Y. M." writes: I have property in a public street and a block of four cottages are drained into a common cesspool. The property is owned by a firm of brewers and the cesspool is another one. The cesspool has an outlet into a pond. The existing conditions have been in operation over twenty years. The whole of the drains and cesspool were put down and have been maintained by the owners. The owner of the field calls upon the local authority to abate the nuisance of an overflow discharging into the pond. Please say are the authority quâ district councils liable for the drains or cesspool or overflow?

In my opinion the drain is a sewer vested in the council from the point at which it is joined by the drain from the cottages. See *Pearce* v. *Battersea*, 1909, 51 J.P., 218. I think the overflow pipe is a continuation of the sewer, and as the cesspool appears to be more or less of a catchpit, it is probably part of the sewer also. (See *Bowman* v. *Bristol Rural District Council*, 67 J.P., 448.) The council are bound to provide the necessary outfall for the sewer. See *Rogers* v. *Tunbridge Wells Rural District Council*, 1906, 2 Q.B., 445. Their statutory powers give them no right to discharge unpurified sewage into the pond (see sec. 17 of the Public Health Act, 1875), but inasmuch as the existing conditions have been in operation over twenty years, the council may have acquired a prescriptive right to do so. Such a right, however, could only have been acquired by the continuance of a perceptible amount of injury for twenty years; and no prescriptive right can be acquired to create a *public* nuisance. Unless the council are in a position to prove a prescriptive right they must provide some other outfall for the sewer.

Private Street Works Act, 1892. Non-service of Owner.—"Vera" writes: My council, carrying out street works under this Act, duly served notices, under sec. 6, upon the reputed owners. No objections were received. The work was completed, and the actual costs prepared and duly served. The street consisted of four corner blocks built on and fenced in, and two open middle strips, each of, say, 120 ft. The owner A of one of the open strips, on receiving his apportionment, called and stated that he was not the owner of the whole 120 ft., but that he had sold a narrow strip 6 ft. wide as a right of way some years previously to B. What is our position, as no notice under sec. 6 has been served on B? Can it be said that A is the reputed owner?

Unless a copy of the resolution to do the works has been served upon the true owner of premises within seven days after the date of the first publication thereof, the authority cannot recover the apportioned expenses (*Wirral Rural District Council* v. *Gardner*, 1903, 1 K.B., 640; *Maguire* v. *Lancaster Corporation*, 1904, 2 K.B., 759; *Bowman* v. *Bristol Corporation*, 67 J.P., 448). Assuming therefore that B, and not A, was the true owner of the 6-ft. strip at the time of the service upon A, the expenses chargeable to the strip are irrecoverable. But if A merely granted B a right of way over the strip, and not the strip itself, A would still be the true owner, and the service on him would be good. No doubt he was the reputed owner, but that would not avail unless he was also the true owner. I assume that the 6-ft. strip adjoins the road.

Road Widening: Electricity Supply.—"J. J." writes: My Highways Committee have recently pulled down a shop which has been in their possession for many years for the purpose of widening a public highway in the town. Before the shop was pulled down the electricity department of the corporation, at the request of the Highways Committee, took out the service from their main to the shop, which was put in at the request of the tenant, but without the consent of the Highways Committee being asked for. The electricity department has now sent an account for the cost of taking out the service, and I shall be obliged if you will advise if the Electricity Committee can legally demand the cost of this work.

The only provision in the Electric Lighting Acts as to the cost of cutting off a supply of electricity appears to be sec. 22 of the Act of 1882, which applies where charges are in arrear. This section is obviously not applicable to the present case, the service having been removed at the request of the owners, and not on account of the non-payment of charges. There may, however, be some clause in the Provisional Order under which these expenses can be recovered, or it may be that the request by the Highways Committee would be construed as implying an agreement to pay the expenses. On the information supplied the point is a doubtful one.

Private Street Works.—"W. A. C." writes: A has a strip of land about 4 ft. wide, and extending the full width of a street which is a cul-de-sac. My council having previously made up this street under the Private Street Works Act, 1892, and the final apportionment having been served on the reputed owners, and the apportionment based on frontage, am I right in including the full width of street, or should I have taken between the kerbs and charged him for making up the carriageway only, or should he be charged on a degree of benefit? I might say that the land on the other side of a stream beyond is in different ownership, and no doubt this piece of land has been reserved in case the other owner should require an outlet at any time.

Assuming that the full width of the street has been made up, I see no reason why A's frontage should not be measured for the full width. He cannot be charged on the "benefit" principle unless a resolution has been passed under sec. 10 of the Act.

Highway: Roller Depot.—"L. C." writes: A rural district council is desirous of renting land for the purpose of a roller depot and yard for the storage of road materials, &c. The council referred to succeeded the old Highway Board in 1894. Under the circumstances, would the renting of the necessary land for a depot be a legal charge on the whole district, and could it be made without a special application being made to the Local Government Board for urban powers?

By sec. 29 of the Local Government Act, 1894, "highway expenses" incurred by the council of a rural district are to be defrayed as "general expenses," payable out of the common fund, with the option to the council (with the approval of the county council), under special circumstances, to charge contributory places separately. "Highway expenses" would appear to include everything incidental to the repair of highways and keeping them in proper condition. (See Pratt and Mackenzie's "Law of Highways," 15th edition, p. 176, note (b)). Whether the provision of a place for the storage of a roller and road materials is incidental to the maintenance of the highways would probably depend upon the circumstances of the particular case. In the event of the expense being disallowed by the auditor an appeal would lie either to the King's Bench Division by *certiorari* or to the Local Government Board.

A BOROUGH COUNCIL'S APPEAL.

NEW TRIAL ORDERED IN BATTERSEA CASE.

The Court of Appeal, yesterday, after a hearing lasting nearly four days, ordered a new trial of the action brought by Miss Papworth, formerly manageress of a confectioner's shop, against the Battersea Borough Council, who were ordered by the lower court to pay damages amounting to £1,961 for personal injuries sustained by plaintiff.

The action was tried before Mr. Justice Horridge and a common jury. Miss Papworth, in January last year, was cycling when, as she alleged, she went over a sewer gully which was in a dangerous state. She was thrown from her machine, and a motor car ran over her, inflicting such injuries that she was disabled permanently from following her occupation. It was contended for the council that in any event they could not be guilty of anything beyond nonfeasance, which was insufficient to render them liable in law; also that liability for non-feasance was only to the community as distinct from the individual, unless such liability was directly imposed by the language of the statute. Mr. Justice Horridge held that the defendants were liable as the sewer authority for not having remedied the defect in the gully.

Yesterday the Appeal Court held that there had been such non-direction by the Judge as to amount to misdirection, and that the damages were excessive. The Court refused, however, to reverse the decision of the Court below, but, as stated, ordered a new trial.

Institution of Municipal Engineers.

EASTERN AND NORTH-EASTERN DISTRICT MEETING AT LINCOLN.

Institution of Municipal Engineers at Lincoln.

A highly successful district meeting of the Eastern and North-Eastern Districts of the Institution of Municipal Engineers was held at Lincoln on Saturday last, the 31st ult. There was an excellent attendance of members and visitors, among those present being the Mayor of Lincoln (Councillor H. E. Newsum), Mr. A. Harrison (chairman, Welton Rural District Council), Rev. S. Wild (vice-chairman, Welton Rural District Council), and Mr. H. B. Kirkley (chairman, Lincoln Board of Guardians), Messrs. Horace Boot (president of the institution), W. C. Brackenridge (Spilsby Rural District Council), T. F. Hewitt (Lincoln), W. Starkie (Welton Rural District Council), J. E. Bolt (Spilsby Rural District Council), H. W. Coulson (Lincoln), C. A. Howard (Brigg Rural District Council), G. E. Mathews (Spalding), A. W. M. Gilbert (Welton Rural District Council), J. H. Holmes (Horncastle Rural District Council), T. R. Howitt (Branston Rural District Council) W. W. Walker (Alford Urban District Council), A. Applewhite (Lincoln), N. E. D. Dixon (Oundle Rural District Council), C. Horobin (waterworks engineer, Lincoln), J. K. Crawshaw (Lincoln), A. Harford Stevens (Blaby Rural District Council), R. A. MacBrair (city surveyor, Lincoln), Stanley Clegg (electrical engineer, Lincoln), G. Belson Chilvers (hon. district secretary) and B. Wyand (secretary of the institution).

An attractive programme had been arranged by Mr. G. Belson Chilvers, the hon. district secretary, the proceedings including a short business meeting, a reception by the Mayor of Lincoln (Mr. H. E. Newsum), luncheon, and an inspection of the city undertakings; the only drawback to a thoroughly satisfactory day was the rain, which fell rather persistently, and not only made the conditions somewhat uncomfortable, but veiled the beauties of the cathedral city in a disappointing way.

At the business meeting at the Guildhall it was decided to recommend that steps should be taken to prepare a roll of honour of those members of the institution who are serving their country with His Majesty's Forces, and that it should be placed in the council chamber of the institution. Members were also recommended to purchase the members' identification badge, which, it was pointed out, greatly facilitated mutual resognition at district and other meetings.

The Mayor, on arrival, was offered a hearty welcome on behalf of the institution by Mr. Horace L. P. Boot, M.I.E.E., M.I.MECH.E., the president, who said the members desired to thank his Worship for being present to receive them to that ancient city. His presence there was an honour to the institution and to every individual member.

The Mayor, on rising to address the company, was warmly cheered. When he received their invitation, he said, he was glad to accept it, and to have an opportunity of offering them a hearty welcome to the city, because it was only right that he should do so seeing that they, as amateur members of the corporation, knew only too well what a debt they owed to their officers. Anyone who held an office such as his was brought more closely into touch with the working of the corporation, and that had only one result—to make him realise that members of public bodies would discharge their duties very badly indeed were it not for the assistance they received. They claimed in Lincoln that their undertakings were in every respect quite up to date. They were not so large, perhaps, as some with which those present might be acquainted, but for their size he believed they would well repay the trouble of inspection. It was with the utmost pleasure that he welcomed them to the city, and he trusted that their stay, though short, would be pleasant and profitable.

The President (Mr. Boot), who had been unable to attend the business meeting, followed with a short address to the members. It was only left for him, he said, to offer a few words of welcome to the various chairmen and vice-chairmen of the district councils who were present, and more particularly to the chairman and vice-chairman of the Welton District Council. They, as municipal officers, appreciated very much the honour those gentlemen had shown to them in coming to their meetings. As municipal officers they were paid for their services, but these gentlemen were giving their services free. It was for the love of seeing order maintained, and having good things carried out for the benefit of citizenship. Speaking of the response made by the members of the institution to the call of King and Country, Mr. Boot said that, in these times when the unfortunate subject of war was on their minds it might interest them to know that their members had rallied magnificently in answer to the country's call. A corps had been formed for the purpose of looking after water supplies, analysing the water and seeing that the sanitary conditions of their soldiers were good. A circular letter was sent to their members inviting them to join, and the response had been so great from the institution that the officer commanding had to send out a number of postcards to members informing them that the corps was at full strength. Whatever else the institution could be criticised for, it was at least a loyal body. In conversation with Captain A. J. Martin, he had asked if he could not approach the War Office and try to induce them to form another corps, so that those who were unable to obtain a place in the first corps might have a further opportunity of enlisting. The fine response that had been made went to show that our good old country was not going to the dogs, as some people seemed to think.

THE VISITS.

After lunch at the Great Northern Hotel, the party proceeded on the round of visits which had been arranged to the municipal works of the city. Unfortunately, the preliminary to this, viz., the visit to the objects of antiquarian interest, with which the city abounds—took longer than was contemplated, and resulted in a considerable cutting of the original programme. Mr. T. Francis Hewitt (member), of the

disposal works have been kindly supplied by Mr. R. A. MacBrair, M.Inst.C.E., the city engineer and surveyor:

EXTENSION SEWAGE DISPOSAL WORKS.

The population sewered is about 68,000.

All the sewage gravitates to the pumping station, and is then lifted some 60 ft. to the farm, ¾ mile distant.

The daily quantity of sewage is about 2,000,000 gallons, sometimes less in dry weather. In heavy rain it rises to 6,000,000 gallons, and pumping takes place continuously.

The tank accommodation is about 2,200,000 gallons; sewage is allowed to rest some ten or twelve hours, and is then run off on to bacteria beds during the night.

There are ten primary bacteria beds and five secondary sprinkling filters. When the bacteria beds were first constructed they were on the contact system. During the last few years the secondary ones have been converted into filter-beds by fixing revolving sprinklers. A commencement has been made so to convert the primary beds, and at the present time one of these is in hand, besides the construction [illegible] primary beds, and 1 acre of sprinkling filters. The sizes of the sprinklers vary from 48 to 95 ft. The makers are W. E. Farrer, Limited, Ham, Baker & Co., Adams-Hydraulics, and the Carlton Engineering Company.

The area of the farm is 96 acres, of which 30 acres consist of roads, tanks, filters, buildings, and sludge lagoons, there being about 14 acres of the last named. The farm is used for sewage which is too thin to go with the sludge, and too thick to go to the filters; again, it is used in flood time.

The nett annual cost at the sewage pumping station, including flushing of sewers, is about £1,200, the cost of digging in the sludge £450, and the loss upon the farm (according to the seasons) about £500.

Next week the refuse destructor adjoining the sewage pumping station is to be opened. The steam generated from the refuse destructor will be utilised in pumping the sewage; the annual coal bill is from £800 to £1,000, which will be saved. The destructor is of the latest type, and is being erected by Messrs. Heenan & Froude, Limited, Manchester.

COUNCIL MEETING.

At a meeting of the council held in London on October 28th the following applicants were recommended for admission: To Membership—Messrs. E. J. Holland, city engineer, Guelph, Ontario; F. E. Reynolds, highway surveyor, Buckingham Rural District Council; and W. W. Walker, surveyor, Alford Urban District Council.

From the applicants recommended for admission at the last meeting eight members and two associate members were elected, and one transfer was made to membership and one to associate membership.

A letter from the Builders' Merchants' Alliance was read as regards uniformity of tenders in the case of sanitary pipes, and it was resolved that an interview with representatives of the alliance be arranged to discuss the matter.

The next meeting of the council will be held in London on November 25th.

Street Paving in Japanese Cities.—Modern street paving is as yet practically unknown throughout Japan. The usual Japanese street has no footway, and no attempts have been made to provide separate roadways for pedestrians outside the business districts of the more important cities. These streets have no artificial pavings, they are usually macadamised in as cheap a way as possible, and are in bad condition at all times of the year in the congested traffic districts. In the city of Tokyo, where there is a population of some 2,000,000, there is only one steam roller employed on these pavings, and that is usually out of order. In Yokohama a few of the business streets have cement footways, but none of the streets are paved. Yokohama has a population of about 400,000, and a street mileage about equal to that of any city of like population.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bispham U.D.C. (October 27th. Mr. M. K. North).—£12,000 for private street improvement in Queen's-drive and Red Bank-road.—It was stated that other streets had been scheduled in the resolutions passed by the council. Queen's-drive was a road running two-thirds the entire length of the district, and was really a continuation of the Blackpool [illegible] and was used by a great deal of traffic. Red Bank-road was only used as an approach to and from the sea front, but there was a good deal of traffic on it.

Croydon T.C. (October 20th. Mr. R. H. Bicknell).—£60,131 for works of street improvement, and £1,800 for works of surface-water drainage in the Pollards Hill district of the borough.—The details were explained by the borough engineer, Mr. G. F: Carter, and there was no opposition.

Dewsbury T.C. (November 3rd. Major C. E. Norton).—£3,200 for sewerage purposes for a portion of the Thornhill district.—The town clerk, Mr. H. Ellis, said the question of draining the district had been before the Thornhill District Council some years before amalgamation with Dewsbury took place, but nothing could be done until the sewage works at Smithy Brook had been extended. The borough surveyor, Mr. H. Dearden, gave evidence in explanation of the scheme.

Lewes T.C. (November 3rd. Mr. R. G. Hetherington).—£22,384 for the completion of the drainage scheme.—It was stated that sanction for a loan of £27,455 was obtained in 1911. There now remained to be carried out the drainage of the part of the town lying to the north of the High-street—the coupling up and connecting with the new system of the drainage of the Cliffe and the Wallands. Those districts were efficiently drained; the only thing needed to be done was the connecting with the new system.

Nantwich U.D.C. (November 3rd. Mr. A. W. Brightmore).—£17,000 for works of sewage disposal.—Opposition was offered on behalf of the Joint Hospital Board, whose hospital adjoins the site, and by private owners.—Mr. Baldwin Latham, the consulting engineer, said in reply that the hospitals at Croydon and Wimbledon were practically built on sewage farms, and there were no two hospitals in the country which were more successful in their treatment of cases.

Redruth R.D.C. (October 20th. Mr. R. G. Hetherington).—£4,250 for a water supply for the parish of Gwennap.—The engineer, Mr. N. Trestrail, said it was proposed to take the water from a source at Treskerby Moor, and pump it to a reservoir at Highway capable of holding 66,000 gallons. The pumping station would be at Treskerby Moor. The scheme would practically include Scorrier, Highway, Vogue, Treskerby, St. Day township, Tolgullow, Crofthandy, Little Beside, Berwithen, and Tolcarne. Twelve gallons per head would be allowed. The capacity of the pumps was 45 gallons per minute, or 2,700 gallons per hour. It was proposed to put a standpipe within 200 ft. of the houses on the line of the main.

Sedbergh R.D.C. (October 27th. Mr. Courtenay Clifton).—£3,200 for the erection of twelve cottages at Guldrey, and three at Saltpie, Millthrop, near Sedbergh.—In order to meet existing and immediate requirements, the council have bought an acre of land at Guldrey for £150, and about 1,000 sq. yds. at Saltpie, Millthrop, for £37 10s. The clerk estimated the income at £150 per year. The inspector said he would be obliged to recommend to the Local Government Board that more land should be bought at Saltpie, or that only two cottages should be built, as there was not enough ground for suitable gardens, which was important to a working man. In another part of England it had been proved that a garden was equal to 1s. 4d. a week, which was a nice help towards the rent.

Stanley U.D.C. (November 3rd. Mr. Edgar Dudley).—£3,000 for the provision of a public park.—It was stated that the scheme would give employment to many men now out of work.

APPLICATIONS FOR LOANS.

Barnstaple T.C.—£600 for a roller and engine shed.

Barrow T.C.—£13,000 for electricity extensions.

Batley T.C.—£6,500 for new electricity undertaking.

Beckenham U.D.C.—£350 for culverting.

Bradford T.C.—£52,000 for new electricity mains and transformer chamber.

Bridlington T.C.—£300 for the purchase of land for a new street.

Brighton T.C.—£385 for the purchase of property for street improvements.

Bury T.C.—£1,500 for road improvement.

Cirencester U.D.C.—£1,150 for the purchase of land for street widening.

Egham U.D.C.—£1,090 for road improvement.

Holme Cultram U.D.C.—£1,200 in connection with Silloth sea wall.

Horsham U.D.C.—£3,000 for an isolation hospital.

Hythe T.C.—£1,000 for laying out the playing fields.

Ilfracombe U.D.C.—£630 for making up High-street with tar macadam, and £350 for the purchase of property.

Llandudno U.D.C.—£1,500 for water main extension.

Loughborough T.C.—£5,806 for a new fire station.

Middleton T.C.—£886 for private street works.

Ramsgate T.C.—£1,820 for wood paving.

Southampton T.C.—£3,360 for a housing scheme; £350 for a reservoir.

Tamworth T.C.—£15,000 for the erection of sixty-seven workmen's dwellings.

Twickenham U.D.C.—£5,040 for works of private street improvements in Cole Park-road, Cole-road, Hill View-road, and Ivy-road, and £300 for private street improvements in Grove-road.

Walthamstow U.D.C.—£14,590 for electricity plant.

Warrington T.C.—£7,540 for paving works.

Worksop U.D.C.—£2,700 for road improvement.

LOANS SANCTIONED.

Barrow T.C.—£6,505 for the purposes of road improvement, and £665 for an underground convenience.

Beckenham U.D.C.—£2,900 for recreation ground extension.

Biddulph U.D.C.—£300 for road improvement.

Bournemouth T.C.—£3,829 for wood blocks, and £1,771 for wood block paving; £250 for building a cottage, and £3,500 for the provision of police barracks.

Brighton T.C.—£1,400 for street improvement.

Brixham U.D.C.—£3,810 for a housing scheme.

Darwen T.C.—£3,500 for works of water supply.

Gillingham T.C.—£2,500 for the purchase of a site for a pleasure ground.

Hanwell U.D.C.—£1,400 for a public convenience.

Hendon U.D.C.—£681 for street works.

Kidderminster R.D.C.—£446 for a water supply for Churchill.

Lancaster T.C.—£3,305 for the construction of a new street.

Petersfield R.D.C.—£8,750 for the Liss sewage disposal scheme.

Rhyl U.D.C.—£2,500 for improvements on the foreshore.

Rotherham R.D.C.—£2,441 for highway improvements.

Sheerness U.D.C.—£6,960 for building a beam engine-house in connection with the new water supply.

Stoke-on-Trent T.C.—£30,000 to cover overdrafts in the electricity accounts and further anticipated works.

Woking U.D.C.—£630 for road improvements.

TOWN PLANNING.

20.	**Neath.** (Mr. George L. Pepler)... ...	—

LONDON ELECTRICITY SUPPLY.

PROPOSED NEW AUTHORITY.

The London County Council on Tuesday had before them the recommendation of a Special Committee for the establishment of a new body, to be known as the "London Electricity Authority," which should deal generally with electricity supply in the area, and have full powers of control over the new electricity undertaking which it is suggested should be created. The county and county borough councils within the area (comprising the counties of London and Middlesex, and parts of Essex, Hertford, Kent, and Surrey) would be represented on the authority.

The committee suggested a sort of municipal and private partnership, or, as they term it, a combination of municipal control and private operation. They propose that the undertaking should be worked for fifty years by a statutory company, subject to control and direction by the authority.

The powers of compulsory purchase of existing undertakings now vested in the council and other municipal bodies are proposed to be transferred to the new authority.

It is estimated that the amount of capital which will have to be provided by the authority for new works is about £5,000,000 for the first period of five years, and further sums thereafter at the rate of something like £1,000,000 a year.

Housing and Town Planning.—At a conference of local authorities at Exeter, under the auspices of the National Housing and Town Planning Council, it was decided that the war should not deter local authorities from proceeding with housing schemes. Authorities were urged to carry through such schemes without delay.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important proposed works of which particulars appear below:—Buildings—Birmingham, Doncaster, Huddersfield, Luton; housing and town planning—Leigh; roads and materials — Cardiganshire, Chorley, Warrington; sewerage and sewage disposal — Hebden Bridge, Pontypool, water, gas and electricity—Southampton. Particulars of other works projected will be found in our Local Government Board Inquiries pages.

BUILDINGS.

Bexley U.D.C.—The surveyor, Mr. W. T. Howes, has received instructions to prepare plans for a new hospital building.

Birmingham T.C.—A scheme has been approved for the enlargement of the West Heath Hospital, at an estimated cost of £8,000.

Burnley R.D.C.—Recently three completed schemes were formally opened on the same day. These were a new steel bridge constructed across the river near Dyer Head, the reconstructed waterworks at White Moor, Foulridge; and the sewerage and sewage disposal works at Trawden.

Doncaster T.C.—New municipal offices are to be erected in the near future in Priory-place, next to the Post Office.

Edinburgh T.C.—The new public hall at Portobello, which gives accommodation for over 1,000, and has cost, with site, about £9,000, was formally opened on Friday last.

Huddersfield T.C.—The council have approved the design for the proposed new swimming baths in Cambridge-road, and have decided to obtain tenders for the work.

Luton T.C.—It has been decided to carry out extensions at the Spittlesea Hospital, at an estimated cost of £5,320.

Midhurst R.D.C.—A resolution has been passed that the council would be prepared to join with Westhampnett and Westbourne in the provision of an isolation hospital.

Panteg U.D.C.—The council have formally adopted the Baths and Washhouses Act, and it is expected that the necessary sanction of the Local Government Board to the borrowing of £900 for the building will follow in due course.

Whitby U.D.C.—It has been agreed to apply for a further loan for the completion of the harbour works. It was stated that the engineer's estimate for the whole of the works was about £73,000. The council accepted a tender for £59,300—a considerable saving on the estimate. In addition, certain repairs to the West Pier End were carried out to the extent of about £2,275—a total of £61,575. The work which had been actually done on the contract amounted to £56,837, which, with the extra work added, made the total expenditure £59,112.

Wigan T.C.—A scheme has been approved for the enlargement of the swimming bath and the rebuilding of the washing baths.

York T.C.—The Health Committee have recommended the city council to join the East Riding County Council in the provision of a joint tuberculosis sanatorium at Raywell, near Cottingham.

HOUSING AND TOWN PLANNING.

Bury T.C.—Competitive plans are being invited for a housing scheme to consist of fifty dwellings.

Campden R.D.C.—A scheme has been adopted for building twelve working-class dwellings, at an estimated cost of £2,700.

Chester-le-Street R.D.C.—It is proposed to provide forty-seven working-class dwellings, at an estimated cost of £12,280.

Leigh T.C.—A scheme is under consideration for building a large number of working-class dwellings at an estimated cost of £15,000.

Llandudno U.D.C.—A tender has been accepted for the erection of sixteen cottages.

Steyning East R.D.C.—The surveyor, Mr. G. W. Watt, has prepared a town planning scheme for Preston rural district and portions of the parishes of Portslade, Hangleton, West Blatchington, and Patcham.

Wallsend T.C.—The council on Tuesday last agreed to make application to the Local Government Board to appropriate for the purpose of additional housing accommodation 8 acres of land which constituted a portion of 33 acres purchased for the purpose of a burial ground.

York T.C.—The Health Committee recommend the council to apply to the Local Government Board to sanction the purchase of an estate in Tang Hall-lane for a housing scheme, without waiting till the application can be made in respect of the erection of houses. The council are also recommended to build twenty-four self-contained, two-storeyed cottages, 100 houses with five rooms, scullery, and bath-room, forty-eight houses of two other types, as soon as all preliminaries have been carried out, subject to certain conditions as to the state of unemployment and the price of building materials.

PARKS AND OPEN SPACES.

Edmonton U.D.C.—A scheme has been prepared for extensive works in the public parks and recreation ground, and application has been made to the Local Government Board for a grant towards the cost.

Stoke-on-Trent T.C.—It is proposed to lay out Fenton Park, at an estimated cost of £9,500.

ROADS AND MATERIALS.

Barmouth U.D.C.—The Road Board have sanctioned a grant of £600, and the county council £150 towards the cost of widening Llanaber-road.

Cardiganshire C.C.—Plans are being prepared for an improvement on the Cenarth-Cardigan road, the estimated cost of which is £7,000.

Cardiff T.C.—A proposal which has been periodically before the council for the last thirty years was again raised at the Public Works Committee, but nothing came of it. This is, as suggested by Councillor Blower, whether something could not be done in the way of constructing a main or circular road around the city, forming direct access from one residential area of the city to another. At present, he said, much traffic congestion was caused by the fact that vehicles, in passing from one area to another, had invariably to pass through the city centre. If the corporation delayed action, it would only cost them thousands of pounds more for the land.

Cheadle R.D.C.—The surveyor of highways, Mr. W. P. Inskipp, has submitted a scheme for an improvement of the road near to Cheddleton Station, at an estimated cost of £352. He also proposes to treat High-street with tar-macadam, at an estimated cost of £390.

Chorley R.D.C.—Consideration is being given to a scheme for a new road from Chorley to Coppull, the cost of which is estimated at £15,000.

Gowes U.D.C.—The council have accepted the tenders of the Associated Portland Cement Company for the supply of cement, of Messrs. Rowe & Mitchell for 200 tons of granite, and of Mr. Downer for gravel.

Croydon R.D.C.—The surveyor, Mr. R. Chart, has received instructions to apply to the Road Board for contributions towards the cost of a number of road improvements that are to be carried out as relief works for the unemployed.

Kingston (Surrey) T.C.—Of six tenders for the supply of 250 yds. of broken granite, that of Messrs. Lavender & Bateman, of Sutton Bridge, at 14s. 9d. per yard, has been accepted.

Northumberland C.C.—The Bridges and Roads Committee have received authority to prepare plans and estimates for a coastal road from Blyth to Amble.

Salisbury T.C.—The borough surveyor, Mr. W. J. Goodwin, has submitted a report in which he estimates that to carry out the proposed improvement

of Castle-street would cost £1,095, and that the London-road would entail an expenditure of £747, making a total of £1,842. The county had been allowed by the county council for this year £527, and they anticipated that £527 would be allowed for next year, making a total of £1,054, and leaving a balance of £788. It was suggested that the Road Board should loan them that amount, but it had been impressed upon the Road Board that it would be much better if they gave the money, and that the council were not asked to repay it, because if they had to repay the money all repair work on other roads would be lying up. This estimate would be presented to the Road Board.

South Stoneham R.D.C.—The surveyor, Mr. F. Heather, reported to the council that he had added to the list of relief works a proposal for widening Burg-seethorn and Allington-road, forming a footpath down one side and constructing an efficient surface-water drainage system. Owing to the cost, which would amount to between £2,000 and £3,000, he did not include it before, but the county surveyor mentioned, although he could not say definitely, that the Road Board might contribute some 50 per cent of the cost. The council would, of course, be able to come to a final decision when the intentions of the Road Board as regarded grants and loans were known.

Thirsk R.D.C.—Some time ago the surveyor, Mr. C. A. Lake, suggested haulage in bulk by petrol tractor in place of the system of accepting tenders for each individual parish. The chief question for the committee to whom this matter was referred was whether the council should purchase a tractor or invite tenders for the work. They decided on the latter course, and the council have now accepted the tender of Mr. T. O. Todd, Ripley, to do the work at 1s. 5d. per ton, as against a former average cost of 2s. 1d. per ton.

Warrington T.C.—The Paving and Sewerage Committee have resolved to pave Buttermarket-street with Lithofalt blocks, and to repave other streets, at an estimated cost of £7,540.

Worthing T.C.—With respect to the scheme to make up Grand-avenue under the Private Street Works Act, an amendment was moved at the council meeting recently to refer the matter back to consider the adoption of a proposal to provide gardens in the middle of the road. This was opposed by Councillor Chignell, who said he considered the scheme chosen by the Highways Committee was the best one. The public appreciated the wide footpaths with grass borders on each side, and a good carriageway. He did not consider it would be an improvement to put "little pottering gardens" in the middle and have a road on each side. There would be constant expense and attention; the gardens would be in the way of the traffic, and the public would be unable to walk over them. The amendment was lost, and the committee's recommendation carried.

Yiewsley U.D.C.—Discussing the questions of tar-macadam and tar-spraying in his annual report, published recently, the surveyor to the council, Mr. John Lewis, says: "The great difficulty in the way of rapidly transforming our gravel-surfaced roads into tar-macadam roads is, as before stated, a question of initial cost. With highway estimates cut down to the lowest possible margin, I am obliged to maintain roads where, if efficiency was the only consideration, I should reconstruct them. An endeavour is being made to convert most of the roads laid with dry gravel into tarred-surface roads. If the necessary funds were available, I should recommend the committee, both on the grounds of efficiency and economy, to lay tar-macadam in future on all our roads. As a rule, conversion would be possible at a price of about 2s. 9d. per super. yard, and when we appreciate the fact that this small urban area is responsible for the maintenance of some 66,000 sq. yds. of road surface, a small calculation will show the figure required to be expended on re-conversion works alone. Again, on account of funds, tar-spraying of road surfaces has been curtailed to a maximum of 15,000 super. yds., whereas on the grounds of preserving the road crust, and reducing the amount of mud in wet weather, I advocated the area to be treated should be considerably increased. There is no doubt but for the surface treatment with tar of the gravel-surfaced roads, their maintenance costs would have been higher, and I am satisfied as to the economy of the process, when applied to roads in a fair state of repair, but it is false economy to apply the tar where roads are otherwise."

SEWERAGE AND SEWAGE DISPOSAL.

Barnoldswick U.D.C.—A repeat order has been placed with Ames Crosta Sanitary Engineering Company, Limited, of Nottingham, for the supply of two 78-ft. diameter patent "Simplex" rotary sprinklers and fittings.

Burnley R.D.C.—It is proposed to expend £1,200 upon alterations to the Hameout sewage disposal works.

Cockermouth R.D.C.—A sewerage scheme for Low Seaton is to be carried out at an estimated cost of £1,640.

Croydon R.D.C.—The relaying of surface-water drains is to be carried out as a means of relieving unemployment.

Hebden Bridge U.D.C.—Sanction has been received to the scheme for the extension of the sewage disposal works.

Horsham R.D.C.—Upon the suggestion of the Local Government Board, it has been arranged to obtain expert advice upon the condition of the Billingshurst sewage disposal works.

Lewes T.C.—The drainage scheme, the cost of which is expected not to fall far short of £50,000, is nearing completion.

Leyburn R.D.C.—Consideration is to be given to the amended plans of a scheme for the drainage of the whole of West Witton, according to the Local Government Board's request to the council. Mr. Rodwell, the engineer, estimates the cost of the work at £1,125, and £75 for land, easements, and legal expenses, making a total of £1,200.

Oakengates U.D.C.—The council last week received a letter from the engineer stating that the total cost of the sewerage scheme already carried out was £15,350, whereas the loan was only for £14,220, an excess over the loan of £1,110. This was accounted for chiefly owing to the increased prices of materials between the preparing of the estimate and the letting of the contract. It was further stated that it was imperative that the sewerage of New-street and Slaney-street be carried out before the wet weather sets in, in order to complete the scheme. It was resolved to send plans to the Local Government Board, asking for sanction to a loan to cover the cost.

Prestatyn U.D.C.—The council have adopted the scheme prepared by Mr. John H. Blizard, ASSOC.M. INST.C.E., consulting engineer, of Westminster and Southampton, for the sewerage and sewage disposal of their district.

Wath-upon-Dearne U.D.C.—An order has been placed with Ames Crosta Sanitary Engineering Company, Limited, of Nottingham, for the supply of the ironwork and fittings required in the new sewage disposal works about to be carried out, including three 91½-ft. diameter patent "Simplex" rotary sprinklers and fittings, one patent Fieldhouse sedimentation tank, one lime mixer, screens, penstocks and valves.

WATER, GAS, AND ELECTRICITY.

Belfast T.C.—The council have determined to postpone the proposed scheme for the erection of new electricity generating works, but in order to meet the requirements of the ensuing three years it has been agreed to make such alterations and additions to the plant in the existing works, provide and equip the necessary sub-stations, and provide and lay cables, at a cost not exceeding £25,000.

Bideford U.D.C.—With respect to the work of deepening the higher reservoir, which is proceeding, the surveyor, Mr. R. E. L. Hookway, has suggested that the contractors should continue and provide for another 1,092,000 gallons at an approximate cost of £460. This the council regarded very favourably, subject to the approval of the engineer, Mr. Baldwin Latham.

Bradford T.C.—The Water Committee propose to accept Messrs. C. Bushby & Sons' tender, at £29,073, for the carrying out of the duplication of seven pipe syphons in connection with the Nidd Aqueduct.

Gloucestershire C.C. — An intimation has been received from the Woods and Forests Department that the Crown would sanction a grant of £5,000 towards the cost of providing a water supply for Coleford and West Dean.

Hexham R.D.C. [illegible] the water supply [illegible]

Hinckley R.D.C. [illegible] ply: Laying of mains, Mr. Geo. Graves, Hinckley, £921; workshop and roads, Mr. E. Chamberlain, [illegible] fencing, Parsons, Sherwin & Co., Hinckley, £53.

Paul (Cornwall) U.D.C.—Plans of a water scheme [illegible] loan of £7,000 or £8,000 for a water and sewerage [illegible]

Southampton T.C.—Tenders are to be obtained for the construction of a reservoir. The approximate [illegible]

Torquay T.C.—The new water main has been laid from Tottiford to Beadon Brook, which represents about one-third of the total length of pipe to be laid, and tenders are being invited for the further extension to Sandford Orleigh, Newton Abbot.

Twickenham U.D.C.—The council have accepted the tender of Messrs. Dennis Brothers (1913), at £1,125, for the supply of a 400-450-gallon petrol motor fire engine, complete with pump, 50-ft. fire escape, and first-aid equipment.

MISCELLANEOUS.

Liskeard R.D.C.—At the council meeting on Saturday Mr. Truscott, the assistant sanitary inspector at £40 a year, who is at present acting as road surveyor for the Northern District, in the absence of Mr. Smale, serving with the colours, made application for an increase of £40 a year, pointing out that it cost that sum to run his motor cycle. Consideration of the matter was adjourned.

Ripon R.D.C. It has been agreed to give twelve months' notice to the Ripon Corporation to terminate the agreement by which £15 per annum is paid for the upkeep of the city fire brigade.

PERSONAL.

Mr. James Jones, of Dolwen, Rhydlewis, has been appointed surveyor to the Llandyssul Rural District Council.

Mr. R. F. Braithwaite, surveyor to the Selby Rural District Council, has been voted £10 a year for the upkeep of his motor cycle.

Mr. W. E. Woollam, surveyor and inspector to the East Grinstead Urban District Council, has had his salary increased by £50 per annum.

Mr. D. B. Elliott, of Bloomfield, Belfast, has been appointed assistant surveyor for portions of Ballymoney and Antrim rural districts under the Antrim County Council.

Mr. Charles Herbert, assistant to Mr. Geo. Riley, engineer and surveyor to the Wellington (Salop) Urban District Council, has been appointed general assistant to the county road surveyor (Mr. W. Jervis) for East Suffolk.

Mr. S. Sutcliffe, surveyor to the Mytholmroyd Urban District Council, has been voted an additional sum of £10 as salary during the month of October for the services he had rendered in connection with the extension and laying of the new water main from Pismire Hill to Upper Foot. It was stated that the work of the surveyor had been "very creditable indeed."

Mr. J. Henry Taylor, M.INST.C.E., borough surveyor and waterworks engineer of Barnsley, has been appointed acting barracks engineer to the Barnsley Battalion of the York and Lancaster Regiment of Lord Kitchener's Army. Mr. Taylor has set out the camp, has obtained tenders, and will superintend the erection of the huts, which are estimated to cost £10,000.

Mr. E. Y. Harrison, ASSOC.M.INST.C.E., engineer and surveyor to the Wellingborough Urban District Council, who has been appointed borough surveyor and water engineer of Guildford, was presented recently, on behalf of the staff at Wellingborough, with a polished-oak smoking cabinet suitably inscribed. The presentation was made by Mr. C. G. Atkinson, assistant surveyor, and Mr. Harrison, in reply, referred to the loyalty and good feeling which the members of the staff had always displayed.

Mr. Vincent J. Willis, assistant surveyor at More[illegible] municipal staff with an inlaid mahogany writing desk, bearing a silver tablet suitably inscribed, and a silver pen, upon the occasion of his leaving More[illegible] to take up a position in the [illegible] on behalf of the subscribers, by the borough surveyor [illegible] his regret at the pending departure of Mr. Willis, whom he had always found to be an efficient and willing colleague. He wished Mr. Willis every success.

FOR OTHER ADVERTISEMENTS

See End of Paper.

COUNTY BOROUGH OF BOLTON.
WATERWORKS DEPARTMENT.

The Corporation invite applications for the position of Junior Engineering Assistant in the Waterworks Engineer's Department.

Salary commencing at £65 per annum.

Applications, in candidate's own handwriting (endorsed "Junior Engineering Assistant"), stating age, qualifications, and experience, together with copies of original drawings prepared by the candidates, and three testimonials of recent date, which will not be returned, to be delivered to the undersigned not later than the 25th November, 1914.

Canvassing, directly or indirectly, will be considered a disqualification.

SAMUEL PARKER,
Town Clerk.

Town Hall, Bolton.
November 4, 1914. (2,065)

TEMPORARY ASSISTANT REQUIRED in the Office of a Borough Surveyor and Waterworks Engineer (population of district 16,000).

Salary £2 per week.

Applications and copies of three testimonials (which will not be returned) to be sent to Box 1,481, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C., not later than Friday, 13th November, 1914. (2,064)

PRACTICAL ROAD SURVEYOR or Foreman Manager to take charge of outside work in connection with the Hipperholme Urban District Council.—Apply by letter, stating qualifications, wages, &c., to the Clerk to the Council, 4 Harrison-road, Halifax, on or before 23rd November, 1914. (2,066)

BOROUGH OF ASHTON UNDER LYNE.

SEWAGE DISPOSAL WORKS RECONSTRUCTION.

CONTRACT No. 4.

The Corporation invite Tenders for the Alteration and Extension of their Sewage Disposal Works at Plantation Farm, Dukinfield.

Plans may be seen, and copies of the Specification, Bill of Quantities, and Form of Tender obtained from the Engineer, Mr. J. Rowbottom, Town Hall, Ashton-under-Lyne, on payment of £5, which will be returned on receipt of a *bonâ-fide* Tender and upon the return of all documents supplied to him.

Tenders, in official envelopes, to be delivered to the undersigned not later than first post on November 11th, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender.

JOHN NEAL,
Borough Comptroller.

Town Hall,
Ashton-under-Lyne.
October, 1914. (2,067)

CLARIDGE'S PATENT ASPHALTE COMPANY.

In order to cope with the requirements of their increasing business, Claridge's Patent Asphalte Company, Limited, have established themselves at new offices, 3 Central Buildings, Westminster, S.W., and on Saturday last the event was celebrated by a company of representative guests at what may be termed an informal house-warming. The visitors inspected with interest the handsome suite of offices, furnished in the most up-to-date style, and equipped with every modern appliance that inventive skill and ingenuity have devised to facilitate and accelerate the movement of the official machinery. The history of this well-known firm since it was established in 1838 goes to show how, at a period when some of the great industrial enterprises of London were still in their infancy. Suspended upon the wall of the managerial sanctum is a painting in oils of the original works of the company in Lambeth, upon the site now occupied by St. Thomas's Hospital, from which one may estimate the foresight of the founders in taking advantage of the opportunities offered by the great waterway of the Metropolis. Among the more curious historical documents that came under notice was a framed copy of the initial prospectus of the company, with its almost unheard of capital of £200,000 in 10,000 shares of £20 each, and the framing thereon of what was doubtless a familiar feature of such prospectuses in those days—viz., a list of "patrons." The names of these included the Duke of Bedford, Marquis of Aberdeen, Marquis of Douglas, Earl Elgin, Earl Leveson, M.P., and Sir J. Henry, Bart. Incidentally it may be stated that the first consulting engineer was Mr. Mark J. Brunel.

In the course of a statement dealing with the history and operations of the company, the manager, Mr. W. Allback, stated that their reason for taking more commodious premises was a satisfactory one, inasmuch as it was owing to their increasing trade in asphaltes. They had also entered into another business—that of tarred slag macadam, under the title of Clarmac Roads, Limited. They started this with works at Bilston, and had since then acquired further properties at Chatterly, in Staffordshire. Their slag heaps were some of the best in all England, consisting as they did of old cold-blast furnace slag, which, owing to its infinitely greater durability over the present-day hot-blast slag, was so much more suitable for road making. He thought they would do a big business in this, and they would try and do their best. Formed in 1838, with a capital of £200,000, to work the patents acquired by Mr. Claridge, in five years the company acquired such a firm hold in this country that the Board of Ordnance placed large orders for asphalting forts, batteries, &c., throughout the kingdom. About 1860 the War Office entered into a contract with the company for all asphalte work under the supervision of the Royal Engineers, which they held, giving unbounded satisfaction for an unbroken period of forty years, when increasing competition made it an unprofitable contract from their point of view. They were also fortunate in having a fair supply of asphalte rock in stock, and further supplies on order and *en route* to their works, and they had no fear as to being unable to fulfil their orders, although these latter had enormously increased this last eighteen months or two years, this being largely due to the advertising campaign they had carried on, and to the kindly notice of their efforts. With respect to Clarmac, this immediately found favour with surveyors owing to its composition, being manufactured from the best hard cold blast furnace slag, and orders had been received from the corporations and councils of Southend-on-Sea, Marylebone, Beckenham, Coventry, Wiltshire and others.

In the course of the proceedings "Success and Prosperity to the Company" was proposed and honoured with much heartiness, acknowledgments being duly made by Mr. W. Allback, Mr. F. J. L. Jamieson on behalf of Mr. George Mason, a recent accession to the business staff.

Concrete Institute. At a meeting to be held at Denison House, Vauxhall Bridge-road, Westminster, on Thursday, November 19th, at 7.30 p.m., Prof. Henry Adams, M.INST.C.E., M.I.MECH.E., F.S.I., will deliver his presidential address.—In view of the war the council has decided to adjourn the matter of continuing educational lectures until a session subsequent to the forthcoming seventh session of 1914-15.

JUNIOR INSTITUTION OF ENGINEERS.

THE WORKING OF STORAGE BATTERIES.

In the room of the Junior Institution of Engineers Mr. Robert Rankin, B.SC., lectured recently on "The Working of Storage Batteries."

The different types of battery were described briefly, and particular stress was laid on the absolute necessity of giving a battery a good send-off by seeing that it received a proper first charge. Prevailing misunderstandings regarding the completion of the first charge were dealt with, and the necessity of continuing it until there is a complete cessation of increase in specific gravities and voltages. The principal battery troubles caused by working, as against those caused by the use of impure electrolyte, were gone into at some length, the effects being described and also methods of meeting and overcoming the troubles. It was specially emphasised that cells are not like machines, but, in fact, rather resemble animal workers in their characteristics. When this fact is properly realised battery troubles will be greatly decreased.

One fruitful source of trouble being excessive discharging, Mr. Rankin described an instrument which he has invented to enable battery operators to keep within proper limits, the instrument and curves showing the variations of battery capacity with rate of discharge, among other things, being shown on lantern slides. Attention was drawn to the necessity in the case of stationary batteries, of keeping proper log sheets of the working and of adhering intelligently to a proper set of working instructions instead of religiously stopping the discharge at a definite voltage and stopping the charge when the ampere-hours put back after a discharge reach a definite percentage over the latter, both voltage and ampere-hours being indicated by instruments which may be very badly out in their accuracy. Lastly, Mr. Rankin said it cannot be expected of battery attendants that they will keep their cells in decent condition unless they have hydrometers and cell-testing voltmeters, and means for giving individual cells a boosting charge in excess of that given to the main body of the battery.

THE EMPTYING OF CESSPOOLS.

The parish authorities of Langley (Bucks) have for many years employed the ordinary sewage pump for emptying the cesspools in their district, but the drawbacks inherent to this system are great, chiefly owing to the unpleasant nature of the work and the time and labour involved. The authorities have accordingly decided to adopt the pneumatic system of cesspool emptying, by means of which the air is exhausted from a cylindrical tank and the contents of the cesspool drawn up into the tank by atmospheric pressure. The efficacy of this plant being dependent upon air-tight conditions, it follows that there is an entire absence of nuisance.

Langley comes under the jurisdiction of the Eton Rural District Council, which has had experience with the Merryweather type of pneumatic cesspool exhauster, two of which have been in use in other parishes for some years past with entirely satisfactory results. It has been decided to meet the requirements of Langley by the provision of two further vacuum tanks, each of 350 gallons capacity, and arranged for horse draught, and the order for these has been placed with Messrs. Merryweather & Sons, of Greenwich. A pump is necessary for exhausting the air from the tanks, and in this connection a novelty is to be introduced. In the former type this work has been effected by a hand-worked air pump, but in the case of the new tanks a neat little 2-h.p. petrol-driven air pump of the double-barrel "Ravensbourne" type, mounted on a four-wheeled carriage which can be easily towed behind one of the tank vans, will be employed. This pump will be available for use with either of the two tanks, and it is calculated that the saving of labour thus secured, combined with the greater rapidity with which the power-driven plant can be worked, will greatly reduce the cost of emptying cesspools in the parish of Langley.

Coast Sand Dunes (By Gerald O. Case, St. Bride's Press, Limited, 24 Bride-lane, E.C., price 5s.).—The rapid increase of sand wastes around our coasts is indeed a serious one, and Mr. Case has done a valuable work in the writing of this book.—*Southport Guardian.*

INSTITUTION OF MUNICIPAL ENGINEERS.

[illegible] Mr. Horace Bell, M.Inst.C.E., Borough Engineer and Waterworks Manager, Wells and Westminster.

[illegible] Mr. W. H. Matthews Jones, C.A., Engineer and Surveyor, Chester.

ANNUAL MEETING IN LONDON.

The [illegible] annual meeting [illegible] will be held at [illegible] Institution of Civil Engineers, Great George-street, Westminster, S.W., on [illegible] and 28th, 1914.

PROGRAMME.

[illegible] Meeting of Council (Chairman's Room, No. 4 South-ampton-row, London, W.C.

[illegible] Annual general meeting. Minutes of last meeting. Presentation of annual report of council. Announcement of result of ballot for election of council for the year 1914-15. [illegible]

[illegible] Visit to the Law Courts.

2.30 p.m.—Re-assemble in Council Chamber.

2.45 p.m.—Presidential address.

Discussion on the following papers to be [illegible] by the members:

"A Plea for the Better Remuneration of Municipal Surveyors and Inspectors of Nuisances in Small Urban and Rural Districts," by G. Belson Chilvers, M.R.San.I. (member).

"Housing of the Working Classes," by Edward Whitwell (member).

"The Future Control and Maintenance of Rural Roads," by J. S. Wooddisse (member).

The papers will be taken as read, and advance copies may be obtained on application to the secretary, and will be forwarded as soon as the papers are in print.

Meetings [illegible] to be held at Newcastle-on-Tyne, on Saturday, November 7th, and December 12th.

B. Wyatt,
39 Victoria-street, S.W. *Secretary*

A Glossary of Road Terms (By H. Percy Boulnois, M.Inst.C.E., St. Bride's Press, Limited, 24 Bride-lane, E.C., Price 2s. nett).—The movement towards standardising the principal roads throughout the United Kingdom has rendered it necessary to correlate the nomenclature of road terms in use in different districts, and Mr. Boulnois has compiled a glossary with the hope that it may form a basis for such a correlation. *Times Engineering Supplement.*

APPOINTMENTS VACANT.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

DISTRICT ROAD SURVEYOR.—November 7th.—County Council of Ross and Cromarty. £150 a year.—Mr. Donald Mackenzie, district clerk, Torridon, Ross-shire.

JUNIOR ASSISTANT.—November 9th.—Foots Cray Urban District Council. £70—£90 per annum.—Mr. W. Augustus Farnham, engineer and surveyor, Council Offices, Sidcup, Kent.

SEWAGE WORKS MANAGER.—November 10th.—Corporation of Dewsbury. £400 per annum.—Mr. H. Ellis, town clerk.

CLERK OF WORKS.—November 10th.—Markets Committee of the Leeds Corporation. £3 per week.—Mr. R. E. Fox, town clerk.

DRAUGHTSMAN.—November 10th.—Corporation of Barrow-in-Furness. £3 per week.—Borough Engineer and Surveyor.

ENGINEERING ASSISTANT.—November 12th.—Corporation of Wrexham.—Mr. J. England, borough engineer.

ENGINEERING ASSISTANTS.—November 12th.—Corporation of Birmingham. £130—£150.—Mr. Henry E. Stilgoe, city engineer and surveyor.

BOROUGH SURVEYOR AND INSPECTOR.—November 14th. [illegible] £130 per annum.—Mr. Bickerton H. Deakin, town clerk.

SEWAGE WORKS MANAGER.—November 14th.—Ashton-in-Makerfield Urban District Council. 50s. per week. Mr. Albert Sykes, clerk, Council Offices.

ROAD FOREMAN.—November 14th.—Corporation of Birmingham. 40s.—45s. per week.—Mr. H. E. Stilgoe, city engineer and surveyor.

ROAD FOREMAN.—November 16th.—Corporation of Beeston. £2 per week.—Mr. J. S. Dunnicliff, town clerk.

TEMPORARY ASSISTANT.—November 21st.—Kettering Urban District Council. £80 per annum.—Mr. John Bond, clerk.

CLERK OF WORKS.—November 24th.—West Suffolk County Council. £2 15s. per week.—Mr. W. Lionel Jenkins, county surveyor, Shire Hall, Bury St. Edmunds.

CLERK OF WORKS.—November 25th. Petersfield Rural District Council. £2 10s. per week.—Mr. A. J. C. Mackarness, clerk.

HIGHWAY SURVEYOR.—November 25th.—Llanybther Rural District Council. £45 per annum.—Mr. J. Ernest Lloyd, clerk, 28 High-street, Lampeter.

ASSISTANT COUNTY SURVEYORS.—November 30th.—Cornwall County Council. £150—£200.—Mr. Christopher L. Cowlard, clerk, County Council Offices, Bodmin.

CITY ENGINEER AND SURVEYOR.—January 31st, 1915.—Port-of-Spain Corporation. £725, inclusive of travelling allowance.—Mr. Joseph Arnold Lamy, town clerk, Town Hall, Port-of-Spain, Trinidad, B.W.I.

ASSISTANT SURVEYOR.—Corporation of Tenby.—Mr. B. Morley, borough surveyor.

ASSISTANT ENGINEER.—Lagos Municipal Board of Health, Nigeria. £300. Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ASSISTANT ENGINEERS.—Public Works Department of the Government of the Gold Coast. £350—£400. Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL COMPETITIONS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

BILLINGE.—November 10th. Specifications for, and for superintending the making of an experimental borehole, for the urban district council.—Mr. A. Darlington, clerk.

SOUTHEND.—December 4th.—Schemes for a tuberculosis hospital, for the corporation. Premiums £100, £50, and £25.—Mr. E. J. Elford, borough engineer.

LIVERPOOL.—February 8th.—Designs for working-class dwellings, for the corporation. Premiums, £100, £50, and £25.—Mr. E. R. Pickmere, town clerk.

MUNICIPAL CONTRACTS OPEN.

Official and similar advertisements received up to 4.30 p.m. on Thursdays will be inserted in the following day's issue, *but those responsible for their despatch are recommended to arrange that they shall reach* The Surveyor *office by noon on* Wednesdays *to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.*

Buildings.

LANCASHIRE.—November 10th.—For the erection of a school, for the Education Committee.—Mr. H. Littler, county architect, 16 Ribblesdale-place, Preston.

BARNET.—November 10th.—For the erection of thirty-two cottages and a block of flats, for the urban district council.—The Surveyor.

UXBRIDGE.—November 10th.—For the erection of twenty-eight dwellings, for the urban district council.—Mr. W. L. Eves, surveyor, 54 High-street.

BARNET.—November 11th.—For the erection of twenty-four cottages, for the rural district council.—Mr. A. J. Wilshire, surveyor.

SHEFFIELD.—November 12th.—For the erection of a boundary wall, for the corporation.—City Engineer.

DURHAM.—November 14th.—For the erection of a dispensary, for the county council.—County Surveyor, Shire Hall, Durham.

KIRKCALDY.—November 14th.—For the erection of a sanatorium and other works, for the corporation.—Burgh Surveyor.

WELLS (Norfolk).—November 14th.—For the erection of [illegible] buildings, for the urban district council.—Mr. H. Kennard, architect, 26 Great James-street, Bedford-row, London, W.C.

WAKEFIELD.—November 16th.—For the erection of additional [illegible] cattle market, for the corporation.—Mr. J. P. Wakefield, city surveyor.

DUNDALK.—November 16th.—For sinking a well and erecting a pump, for the rural district council.—Mr. P. Cahill, Francis-street, Dundalk.

GREETLAND.—November 16th.—For the erection of public lavatories and waiting-room, for the urban district council.—Messrs. R. Horsfall & Son, architects, 22a Cheapside, Halifax.

WIGAN.—November 16th.—For the extension of the swimming bath, for the corporation.—Mr. A. T. Gooseman, borough engineer.

HORNSEY.—November 16th.—For the erection of an electric lighting station, for the corporation.—Mr. E. J. Lovegrove, borough engineer and surveyor.

BRIGHTON.—November 17th.—For demolishing and rebuilding 83 Grand-parade, for the corporation.—Borough Surveyor, Town Hall.

GODSTONE.—November 17th.—For the erection of a cottage at the sewage works, and laying a sewer, for the rural district council.—Mr. T. C. Barralet, surveyor, Station-road, West Oxted.

BARNET.—November 17th.—For the erection of council offices and an underground convenience, for the urban district council.—Mr. W. B. Chancellor, engineer and surveyor.

GLOUCESTER.—November 19th.—For the erection of a tuberculosis block, for the corporation.—Mr. R. Read, city surveyor.

STAMFORD.—November 20th.—For the erection of twenty-four cottages, for the corporation.—Mr. F. R. Ryman, borough engineer.

HAMPSHIRE.—November 20th.—For the erection of a new school, for the county council.—Mr. A. L. Roberts, architect, The Castle, Winchester.

BARNSLEY.—November 21st.—For the erection of a school, for the Education Committee.—Mr. E. W. Dyson, architect, Regent-street, Barnsley.

BARROW.—November 23rd.—For the erection of a public library, for the corporation.—Borough Engineer and Surveyor.

LONDON.—November 24th.—For the erection of an annexe to engine-house at Abbey Mills pumping station, for the county council.—Chief Engineer, Spring-gardens, S.W.

BRISTOL.—November 26th.—For the reconstruction of the cattle market, for the Market Trustees.—Mr. P. Addis, The Exchange, Corn-street, Bristol.

BOMBAY.—January 7th.—For the complete manufacture, erection and equipment of a refuse destructor for the incineration of 200 tons of refuse per day, for the municipality.—Mr. P. R. Cadell, municipal commissioner, Municipal Offices, Bombay, India.

Iron and Steel.

CROYDON.—November 10th.—For the supply of 850 tons of cast-iron pipes and specials, for the corporation.—Borough Engineer.

EAST GRINSTEAD.—November 11th.—For the extension of cast-iron mains, for the rural district council.—Mr. C. Turton, surveyor.

DARTFORD.—November 16th.—For supplying and laying cast-iron pipes for the electricity works, for the urban district council.—Mr. W. Kay, clerk.

TORQUAY.—November 17th.—For laying 3,700 yds. and 6,150 yds. respectively of 15-in. and 14-in. cast-iron pipes, for the corporation.—Mr. Samuel C. Chapman, water engineer.

OSWESTRY.—November 23rd.—For providing and laying 4-in. and 3-in. cast-iron mains, sluice valves, fire hydrants, and air valves, for the rural district council.—Messrs. Berrington, Son & Watney, Prudential Chambers, Wolverhampton, and 28 Victoria-street, Westminster, S.W.

BIRKENHEAD.—December 7th.—For the supply of sluice valves, automatic valves, boxes, and gratings, for the corporation.—Sir Alexander Binnie, Son & Deacon, St. Stephen's House, Victoria-embankment, London, S.W.

Roads.

HAYWARDS HEATH.—November 9th.—For private street works, for the urban district council.—Mr. G. Plummer, engineer and surveyor.

EASTBOURNE.—November 9th.—For private improvement works, for the corporation.—Mr. A. E. Prescott, borough surveyor.

KENILWORTH.—November 9th.—For the supply of broken granite and slag, for the urban district council.—Mr. S. Douglas, engineer and surveyor.

ISLINGTON.—November 10th.—For paving with granite setts and wood blocks, for the borough council.—Mr. J. Patten Barber, borough engineer.

CHIPPENHAM.—November 10th.—For the supply of granite macadam, chippings, tar-macadam, steam rolling, disinfectants, tar, Tarvia, and similar materials, for the corporation.—Mr. A. E. Adams, borough surveyor.

WALSALL.—November 10th.—For work of road repair, for the corporation.—The Borough Surveyor.

DEVON.—November 11th.—For the diversion of a road, for the county council.—County Council Offices, The Castle, Exeter.

BIRKENHEAD.—November 11th.—For making up certain roads, for the corporation.—Mr. C. Brownridge, borough engineer and surveyor.

ROMSEY.—November 12th.—For steam rolling and scarifying, for the corporation.—Borough Surveyor.

CHELMSFORD.—November 12th.—For the supply of Guernsey granite, for the corporation.—Borough Engineer.

NEWMARKET.—November 12th.—For the supply of a steam roller with scarifier, for the urban district council.—Mr. William Henry Eley, engineer and surveyor.

LEEDS.—November 12th.—For making up certain streets, for the corporation.—Highways Department, 135 Kirkstall-road, Leeds.

READING.—November 12th.—For making up part of Albert-road, for the sanitary authority.—Mr. J. Bowen, borough engineer and surveyor.

PRESTON.—November 13th.—For making up certain streets, for the corporation.—Borough Surveyor.

HASTINGS.—November 14th.—For the supply of 1,000 yds. of unbroken blue stone, for the rural district council.—Mr. D. Paine, surveyor, Stonelynk Farm, Fairlight, Hastings.

WAKEFIELD.—November 16th.—For forming private streets, for the corporation.—Mr. J. P. Wakeford, city surveyor.

EAST SUSSEX.—November 16th.—For the supply of materials, haulage, and team labour, for the county council.—Mr. F. J. Wood, county surveyor, County Hall, Lewes.

LUTON.—November 16th.—For the supply of broken slag, for the year ending November 30, 1915, for the corporation.—Borough Engineer.

NORTHUMBERLAND.—November 16th.—For supplying, breaking, and carting stone, and also for the supply of tar, pitch, and creosote oil, for the county council.—County Surveyor, Moot-hall, Newcastle-on-Tyne.

FARNHAM.—November 17th.—For the supply of granite, for the urban district council.—The Surveyor.

WEST HARTLEPOOL.—November 18th.—For the supply of concrete kerbstone flags, scoriæ, whinstone channel blocks, paving setts, hand, machine, and unbroken whinstone, pitch, tar, and lime, for the corporation.—Mr. N. F. Dennis, borough engineer and surveyor.

SOUTHAMPTON.—November 18th.—For the hire of steam rollers during the year ending March 31, 1916, for the county council.—County Surveyor, The Castle, Winchester.

SOUTHAMPTON.—November 18th.—For the supply and delivery of tools for use on main roads, for the county council.—County Surveyor, The Castle, Winchester.

SOUTHAMPTON.—November 16th.—For the supply [illegible] of the municipal roads for the [illegible] County Surveyor, The Castle, Winchester.

WEST SUFFOLK.—November 23rd.—For the supply of tar for the surface treatment of roads, for the county council.—Mr. W. Lionel Jenkins, county surveyor, Bury St. Edmunds.

ELLESMERE PORT.—November 28th.—For making up certain streets, for the urban district council.—Council Offices.

Sanitary.

RICHFORD.—November 9th.—For constructing about [illegible] glazed stoneware and cast-iron pipe sewers, together with manholes and other works, for the rural district council.—Mr. A. C. Madge, surveyor.

TAVISTOCK.—November 10th.—For the construction of sewerage and sewage disposal works, for the rural district council.—Mr. T. H. Harris, 1 Millbrook-place, Tavistock.

NEWQUAY.—November 10th.—For the construction of sewage disposal works, for the urban district council.—Mr. J. Ennor, surveyor, Newquay, Cornwall.

DUKINFIELD.—November 10th.—For the extension of the sewage disposal works, for the corporation.—Mr. J. Rowbotham, engineer, Town Hall, Ashton-under-Lyne.

EASINGTON.—November 10th.—For the construction of about 16,000 lin. yds. of stoneware and cast-iron pipe sewers, with manholes, flushing chambers, and other works connected therewith, for the rural district council.—Mr. G. Waterhouse, engineer.

SEDGEFIELD.—November 11th.—For scavenging and the removal of house refuse, for the rural district council.—Mr. J. W. Tweddle, inspector, Blackgate, Coxhoe, Durham.

LICHFIELD.—November 11th.—For laying sewer and manholes, for the rural district council.—Mr. C. O. Rawstron, surveyor.

ASHTON-UNDER-LYNE.—November 11th.—For the extension of the sewage disposal works, for the corporation.—Mr. J. Rowbottom, engineer, Town Hall.

ORSETT.—November 18th.—For the construction of sewers, and providing engines, compressors, ejectors, and other works, for the rural district council.—Messrs. H. Walker & Son, Albion Chambers, King-street, Nottingham.

PAIGNTON.—November 23rd.—For laying a sewer, for the urban district council.—Mr. C. O. Baines, engineer and surveyor.

PETERSFIELD.—November 25th.—For the construction of about [illegible] pipe sewer with manholes, and sewage purification works, for the rural district council.—Messrs. Chambers, Smith & Adams, 53 Victoria-street, Westminster, S.W.

ALEXANDRIA.—December 8th.—For the construction of a sewerage system, for the municipality.—"M. le Président de la Commission Municipale d'Alexandrie," Alexandria.

Stores.

CHATHAM.—November 11th.—For the supply of Thames ballast, crushed ragstone, stock bricks, Portland cement, lime, sewer boots, stoneware drain pipes, street gullies, sewer ironwork, timber, paints, oils, disinfectants, brooms, brushes, picks, shovels, and ironmongery, for the corporation.—Borough Surveyor.

BRISTOL.—November 16th.—For the supply of stores, for the Sanitary and Improvement Committee.—City Engineer.

WEST HARTLEPOOL.—November 18th.—For the supply of road materials, sewer pipes, pitch, tar and lime, for the corporation.—Nelson F. Dennis, borough engineer and surveyor.

Miscellaneous.

OSWESTRY.—November 9th.—For laying mains, sluice valves, and fire hydrants at waterworks, for the rural district council.—Messrs. Berrington, Son & Watney, Prudential Chambers, Wolverhampton, and 22 Victoria-street, Westminster.

CROYDON.—November 10th.—For supplying deep well pumping engine and pumps at waterworks, for the corporation.—Borough Engineer.

SPENNYMOOR.—November 12th.—For the extension of the cemetery, for the urban district council.—Mr. C. R. Spencer, surveyor.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor *readers with a view to making the information given under this head as complete and accurate as possible.*

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

ABERGELE.—For the construction of a stoneware sewer, for the urban district council. Mr. M. R. Jones, surveyor:—

Allen & Owen, Rhyl	£432
Anderton & Co., Colwyn Bay	280
Jones & Prichard, Abergele	279
W. H. Jones, Abergele	264
G. Lumb, Old Colwyn	240
J. Lyon, Old Colwyn	240

Surveyor's estimate, £200.

ANNFIELD PLAIN.—For the erection of eight houses, for the urban district council. Mr. T. J. Trowsdale, surveyor:—

Arthur & McHugh, Tanfield S.O., Co. Durham	£1,759
K. S. Ledger, Annfield Plain	1,748
Reynolson Brothers, Tipton S.O., Co. Durham	1,710
J. Douglass, Newcastle-upon-Tyne	1,702
Lee & Dunn, Annfield Plain	1,701
Elliot & Loverick, Annfield Plain	1,662
J. G. Bell, Annfield Plain	1,530
J. T. Castle, Annfield Plain	1,515

BRIDGEND.—For making up back lanes, for the urban district council. Mr. W. E. Tudor, surveyor:—

T. D. Evans, Coity	£160
E. Jones, junr., Coychurch	155
G. Jones, Bridgend	147
Smith & Palmer, Bridgend	137

CHELMSFORD.—Accepted for private street works, for the corporation.—Mr. P. T. Harrison, borough engineer:—
Davey & Armitage, Southend-on-Sea, £850.

FELTHAM.—Recommended for acceptance for the supply of granite, for the urban district council.—Mr. G. Stevens, surveyor:
Dosthill Granite Quarry Company, Limited, Dosthill, near Tamworth.—12s. 11d. per ton.

HALLOW.—For the Hallow sewerage scheme. Messrs. Willcox & Raikes, Birmingham, engineers:—

Johnson Brothers, Gloucester	£5,139
Tilt Brothers, Bromsgrove	4,935
G. Law, Kidderminster	4,899
Childs & Withers, Worcester	4,557
W. Thorpe, Birmingham	4,353

HAWARDEN.—For the erection of a public convenience, for the rural district council.—Mr. L. F. Wilson:—

W. Astbury, Penyffordd	£260
D. H. Roberts, Hope	240
A. Edwards, Cymmon	234

(The matter is deferred for the present.)

INVERNESS.—Accepted for the erection of a hall and other works at Merkinell public school, for the School Board. Mr. J. H. Gall, architect:—

New Hall and Class-rooms.

Masons' Work.—H. Macvinish, Inverness, £329.
Carpenters' Work.—Robertson & Gillies, Inverness, £476.
Slaters' Work.—Taylor & Son, Inverness, £55.
Plumbers' Work.—W. Urquhart, Inverness, £173.
Plasterers' Work.—D. Dallas, Inverness, £78.
Painters' Work.—J. Cameron, Inverness, £66.
Smiths' Work.—Rose Street Foundry Company, Inverness, £157.

New Latrines and Lavatories.

Masons' Work.—L. Maclean & Son, Inverness, £93.
Carpenters' Work.—Grant & Johnstone, Inverness, £83.
Slaters' Work.—J. Reid, Inverness, £13.
Plumbers' Work.—W. Urquhart, Inverness, £239.
Plasterers' Work.—W. Johnstone, Inverness, £52.
Painters' Work.—T. Tulloch, Inverness, £13.

Additions—Janitor's Lodge.

Masons' Work.—H. Macvinish, Inverness, £93.
Carpenters' Work.—N. Smart, Inverness, £73.
Slaters' Work.—J. Reid, Inverness, £6.
Plumbers' Work.—W. Urquhart, Inverness, £31.
Plasterers' Work.—W. Johnstone, Inverness, £28.
Painters' Work.—S. Fraser, Inverness, £13.

KNARESBOROUGH.—For private street works, for the rural district council:—

E. Long, Harrogate	£1,159
C. H. Dickinson, Harrogate	915
H. Hawe, Killinghall	802

LIMPSFIELD (Surrey).—For the erection of ten working-class dwellings, for the Godstone Rural District Council.—Mr. T. C. Barralet, surveyor:—

Durtnell & Son, Brasted	£2,715
C. & H. Gasson, East Grinstead	2,540
F. Sales & Son, Oxted	2,500
J. Quittenton, Warlingham	2,499
J. J. Pink, Mersham	2,497
Building and Estates Development Company, Bristol	2,450
A. & E. Gunstone, Broughton	2,420
A. Payne, Lingfield	2,390
Head Brothers, Lingfield	2,380
E. G. Stanford, Lingfield	2,350
G. E. Loveland, Limpsfield	2,340
Smith & Sons, Croydon	2,235
R. Love & Co., Sunninghill	2,139
J. Luxford, Forest Row, Sussex	2,112
T. White, Haywards Heath	2,075
N. Smith, Maidstone	1,990
T. C. Gorham, Whyteleafe	1,961
A. Hitchcock, Tatsfield	1,953
J. Brasier & Sons, Limpsfield	1,850
W. Sanderson, Whitehill, Hants	1,844
C. Collings, Dartford	1,750

Surveyor's estimate, £1,845.

The Surveyor

And Municipal and County Engineer.

Vol. XLVI. NOVEMBER 13, 1914. No. 1,191.

Minutes of Proceedings.

Private Street Works.

In the well-known case of *Herne Bay Urban District Council* v. *Payne* (L.R., 1907, 2 K.B., 130; THE SURVEYOR, vol. XXXI., p. 564) it was decided that, in preparing a provisional apportionment under the Private Street Works Act, 1892, all premises abutting on the street must be included—not excepting premises which are not chargeable with a share of the expenses because they are exempted either by the Act itself—as in the case of churches, chapels, railways and canals—or for any other reason. From a perusal of the judgment of Lord Alverstone it is clear that one consideration which had considerable weight with the Court in coming to their decision was that "the person who had got to pay was entitled to know how much of the expenses the local authority was going to bear." There are passages in the judgment, however, which seem to indicate that the application of the principle established by this case is not restricted to cases where part of the expense is to be borne by the authority. Take a case, for instance, where it is proposed to make a footpath on one side of a street only, and the authority, having passed a resolution under sec. 10 to adopt the "benefit" principle, apportion the expenses exclusively on the frontagers on that side of the street, intending, when they shall make up the rest of the street, to charge the cost of the footpath on the other side solely upon the frontagers on that side. Such a case is referred to in the *Justice of the Peace* for November 23, 1912 (*Tottenham Urban District Council* v. *Rice and Others*). The premises on this latter side were not included in the provisional apportionment, and it was contended before the magistrates that, upon the authority of the Herne Bay case, the apportionment was bad, and must be quashed. On behalf of the council, however, it was pointed out that, upon the authority of *Twickenham Urban District Council* v. *Munton* (1899, 2 Ch., 603), the magistrates had power, instead of quashing the apportionment, to amend it by including the omitted premises, and this course was adopted. At a subsequent hearing the owners of these premises were represented, and contended that the amount apportioned upon them should be "nil." This was opposed by the other frontagers, and eventually the magistrates apportioned the expenses among all the owners of premises on both sides of the street according to frontage, thus in effect quashing the resolution passed by the council to adopt the "benefit" principle.

This result cannot be said to be very encouraging to local authorities who contemplate the application of that principle. Moreover, it would seem that in this respect sauce for the goose is not sauce for the gander. It has been decided that, unless a "benefit" resolution has been passed by the local authority, the magistrates have no jurisdiction to reduce—or, we presume, to increase—the amount apportioned to any premises in consideration of the degree of benefit to be derived (*Bridgwater Corporation* v. *Stone and Another*, 99 L.T., 806). This seems reasonable enough, but it is rather illogical that the converse should not hold good. If magistrates may not apply the principle in the absence of a resolution to adopt it, it is difficult to see why they should be at liberty to override such a resolution when it has been passed.

* * *

The Surveyors' Institution.

Although the greater part of the inaugural address of Mr. Howard Chatfeild Clarke, the new president of the Surveyors' Institution, was devoted to the important subject of urban housing, it was only natural that in his opening remarks he should have referred to the effects of the present international situation upon the work of the institution. As was pointed out in these columns last week, the war is bound to produce acute distress among the professional classes, and it is earnestly to be hoped that Mr. Chatfeild Clarke's appeal on behalf of the work of the Professional Classes War Relief Council will meet with a ready and generous response from those to whom it was addressed. Statistics show that for some years past the number of dwelling-houses of an annual value of less than £20 has tended to decrease each year, although the normal rate of increase in the population has been preserved. This means that the housing requirements of the great urban populations are not being met by private enterprise. Several reasons may be adduced for this. In the first place there is little doubt that, rightly or wrongly, the famous Finance Act of 1910 had an unsettling effect. Again, the increased cost of building, as regards both labour and materials, has rendered it increasingly difficult to build for the working classes houses which can be let at an economic rent. Finally, the increased cost of money, reflected in the low prices of consols and other gilt-edged securities, has tended to divert capital from housing purposes.

How then are the people to be housed? We

[illegible] and surroundings. Unless, however, the cost of building can be lessened, it is evident that some alternative must be found to housing by private enterprise. In some districts something can be done by a reasonable modification of by-law requirements, a question upon which the views are well known. When all these means have been exhausted, however, it is the clear duty of the local authority to exercise their powers under the Housing of the Working Classes Acts to supply the deficiency. We must say in passing that we have considerable sympathy with Mr. Chatfeild Clarke's plea for a consolidation of those Acts, which extend in date from 1890 to 1909. He very aptly pointed out that, although the modern method of legislation by reference may have advantages when a Bill is being passed through Parliament, these are far outweighed by the continued difficulty of interpreting a number of unrepealed measures all dealing with the same subject, which is thereby thrown upon those concerned in their administration. The concluding part of the address dealt with the intimate connection which exists between the housing and transit questions. Much has been done by tramway and motor omnibus development to enable persons to travel to and from the outlying districts of the great towns, but in many cases—particularly, perhaps, in London—this has accentuated another problem—that of traffic congestion. We cannot, however, enter into this matter here. Suffice it to say that no remedy will be really satisfactory that is not conceived on broad and comprehensive lines.

* * *

Extraordinary Traffic: The Amount Recoverable.

When the liability for extraordinary traffic expenses has been established it remains to be determined what amount the highway authority can recover. Sec. 23 of the Highways and Locomotives Amendment Act, 1878, provides for the recovery of the amount of such expenses as may be proved to the satisfaction of the Court to have been incurred by reason of the damage. In *Pool Highway Board* v. *Gunning* (46 J.P., at p. 709) Mr. Justice Field expressed the opinion that the actual cost of reinstatement of the road is not the measure of the sum recoverable, inasmuch as this would leave out of account the effect of the normal wear of the road.

What then is the basis of calculation? The Courts have not answered this question with a very certain voice. In the first place it will be remembered that a condition precedent to establishing a claim for these expenses is the issue of a certificate by the surveyor that, "having regard to the average expense of repairing highways in the neighbourhood," extraordinary expenses have been incurred. Now according to the earlier cases it was not necessary for the Court to go into the question of the average cost of other roads, or to require any evidence on the point, this being a matter for the surveyor to consider before giving his certificate (*Bromley Rural District Council* v. *Chittenden*, 70 J.P., 409). But according to a later case it is a matter to be inquired into by the Court, and specific evidence of such average cost must be given at the trial, failing which the action will be dismissed (*Billericay Rural District Council* v. *Poplar Union*, 1911, 2 K.B., 801). Two of the Lords Justices of Appeal in that case were of opinion that this "average cost" is not merely an item to be taken into account, but forms the actual basis of the calculation. And Lord Justice Vaughan Williams pointed out in support of this view that "if you have to find out how much of the expense incurred is attributable to the extraordinary user as distinguishable from the ordinary use, you obviously have to make a calculation which it is not only very difficult, but almost impossible to arrive at with real accuracy." This decision, it will be seen, is in direct conflict with the Bromley case, which has also been further discredited by a still later decision of the Court of Appeal (*Colchester Corporation* v. *Gepp*, 1912, 1 K.B., 477). It would seem, therefore, that the sum recoverable is not the difference between the actual cost and what—but for the traffic—would have been the cost of repairing the damaged road, but the difference between such actual cost and the average cost, during a similar period, of repairing an equal length of road of the same class.

The Question of our Timber Supplies.

A conference was recently held between representatives of the architects and builders and the officials of the Board of Trade to consider the question of our timber supplies during the war. As everyone knows, with the Baltic practically closed to navigation, our imports of timber for the present year are much below the average, and the price has risen considerably. Possibly the increase of price has in some localities been much more than was justifiable, but it is generally admitted that an increase of about 15 per cent in the case of fir is warranted by the circumstances. In addition to the difficulties of the present, there is the question of supplies next year, when possibly the conditions as to navigation will not have been improved. Even when the war is ended a shortage of supplies will still have to be faced, for it can hardly be supposed that at the German and Russian Baltic ports, from which we draw the bulk of our supplies, the industry of preparing the timber for export is proceeding under normal conditions. But in considering our position, both at present and in the immediate future, with regard to timber supplies, it must not be forgotten that a considerable amount of timber, and that of the best kinds, comes *viâ* Archangel, from which port—in spite of the non-existence of transports for the much-discussed Russians—a far greater amount of shipping has recently come than is the case in normal times. Also it is worthy of notice that with Baltic or White Sea fir considerably increased in price, the cheaper grades of pitch-pine, or such woods as the Canadian red pine, become about equal in price to fir, and are thus available for ordinary building. This fact should militate against the cost of timber being brought to a higher level than at present. The representatives at the conference appear to have contented themselves with receiving and noting suggestions, one of the most practical of which was that an inquiry into the amount of existing stocks should be made with a view to see whether the shortage of timber is likely to become of serious proportions. Although it seems hardly likely that any drastic Government move will be necessary, it is a good sign that the Board of Trade have this question in view. The action of the Government in regard to the supplies of sugar is ample evidence that those at the head of affairs can be trusted to take drastic steps where necessary to safeguard the interests of the country in the present crisis.

* * *

The Engineer's Library.

In most engineering offices the problem of what to do with the inevitable accumulation of pamphlets and periodicals arises from time to time, even if it is only forced to the front by the presence of an unsightly and untidy

accumulation of such matters. As was pointed out in an article on the subject which appeared in a recent issue of an American contemporary, there are only two reasonable courses to pursue. One is frankly to put all these books and papers into the waste-paper basket, and the other is to arrange and index them so that they may be readily available for use when required. The usefulness of such a collection cannot very well be gainsaid. With regard to the preservation of periodicals, it is pointed out that, while it may be advisable to clip certain articles of interest from miscellaneous journals whose general run of material is only of occasional interest or value, on the whole the practice of clipping and filing only portions of the best technical journals is a short-sighted policy and not an economical or efficient one for an engineering office. No engineering office is prophetic enough to foresee exactly what information needs to be cut out and preserved for future use when one considers the variety of valuable material found each week in the leading technical journals. Moreover, the best journals publish periodical indexes, and are thus readily available for reference when bound. As regards pamphlets, too, the practice of keeping orderly files and indexes will be found a time-saving practice in the long run, even if it be found necessary to allot to one assistant the duties of "librarian" for this purpose.

* * *

A Town Planning Survey.

It has been suggested to the Architects' War Committee that the period of professional inactivity caused by the war might be turned to advantage in the cause of town planning. Accordingly they have drawn up a scheme for a survey of cities and towns for the guidance of town planners. The practical value of such a work would, of course, depend upon the form which it assumed when completed. It is not intended that it shall be the product of the architectural profession alone, but of a combination of professions and services more or less intimately connected with town planning. The list to be employed includes draughtsmen, librarians, artists, surveyors, landscape gardeners, barristers, medical men, and sanitary experts, and the scheme, as drawn up by the War Architects' Committee, of which Mr. Ernest Newton, A.R.A., is chairman, provides for the following groupings: (1) Archæological (sites and buildings of architectural interest; use and preservation of buildings obsolete for their original purposes); (2) Social and Recreative (parks and recreation grounds, baths, libraries, golf links, &c.); (3) Educational facilities; (4) Health; 5 Trade (centres of employment, probable future extensions; character of industries, wages, &c.); (6) Traffic (existing facilities by railway, water, tramway, and roads, and probable future developments in relation to traffic). The project is, as will be seen, sufficiently ambitious to test the energy and resourcefulness of the Architects' War Committee, who, it is stated, intend to carry it through with the aid of local committees.

* * *

A Useful Suggestion.

At a time like the present, when so many individuals at great personal cost have placed their lives—if need be—at the disposal of their country, it is only natural that those who are perforce merely spectators of the mighty events which are taking place should do all in their power to render easier the lot of the men who have undertaken the greater task. Any suggestion having this object in view is worthy of sympathetic consideration, and accordingly we desire to direct attention to a proposal which was made at last night's meeting of the Society of Architects, and which we venture to think might well be adopted by other bodies. In the course of his presidential address, Mr. E. C. P. Monson, F.R.I.B.A., suggested that the society should forego during the period of the war the annual subscriptions of those members who are on active service; and further, that unusual consideration in the matter of subscriptions should also be given to other members in genuine cases of distress due to the war. Most professional societies are compiling Rolls of Honour of those who have answered their country's call, but when the matter is considered, we are confident that they will desire also to give at least this slight material recognition to those who after all are for the time being cut off from most of the advantages of their membership. In these days decisions have to be made quickly, and we venture to hope that the lead given by the Society of Architects will be promptly followed by the several engineering and particularly municipal engineering—institutions.

* * *

Institution of Municipal Engineers.

The decision to hold the forthcoming annual general meeting of the Institution of Municipal Engineers in London, instead of at Chester where Mr. Matthews Jones, the president-elect, holds the office of city engineer—was arrived at only after careful consideration, and is due to the prevailing circumstances. The meeting, which will be held on Saturday, November 28th, will necessarily be curtailed, and the programme will be confined to the transaction of routine business, the delivery of the presidential address, and the discussion of papers. The last-mentioned are three in number, and all deal with important subjects. In the first, Mr. G. Belson Chilvers makes "A Plea for the Better Remuneration of Municipal Surveyors and Inspectors of Nuisances in Small Urban and Rural Districts." This is a question upon which we have not hesitated to comment as the facts in regard to flagrant examples of under-payment have come to our notice, and we shall await with special interest Mr. Chilvers' views on the matter. Mr. Edward Whitwell will contribute a paper on the "Housing of the Working Classes," a subject so wide that we imagine he will find it necessary to deal only with certain aspects of it. Finally, the question of "The Future Control and Maintenance of Rural Roads" will be introduced by Mr. J. S. Wooddisse. Each of these papers ought to produce an interesting discussion. The day's proceedings will conclude with an informal dinner, at which a large attendance is hoped for.

* * *

Street Pavings in Sheffield.

The experience of the surveyor of highways and deputy city surveyor of Sheffield, Mr. W. J. Hadfield, would seem to be that where street traffic is of a nature especially destructive to sett paving, wood proves as economical as granite. Mr. Hadfield thinks that generally the difference between the ultimate cost of these two forms of paving is becoming less, to say nothing of the convenience arising from the silence of wood and its comparative cleanliness. His view is that, for central streets, granite paving must, on account of its noise, now be looked upon as obsolete. In his annual report just issued he points out that, after the old-fashioned water-bound macadam, the most dusty roads under modern traffic are some of those paved with setts. The vehicle which raises most dust is the twin-tyred motor, and on roads over which these pass it has been found impossible, in spite of daily machine sweeping, to keep the joints of the setts clear. Such has been the nuisance, in fact, that during last summer some of the granite-paved roads in the east end of Sheffield were actually treated in the same way as water-bound roads. What say Mr. Hadfield's brother surveyors?

Refuse Disposal.

By Prof. E. R. MATTHEWS, [illegible], Chadwick Professor of Municipal Engineering in the University of London.

[Lecture delivered at University College recently.]

[illegible] Public Health Act 1875 [illegible] that they shall [illegible] the collection and disposal of [illegible] refuse.

In addition to [illegible] there are [illegible] earthenware, and a fair quantity of vegetable refuse. Not only is this so, but the habits of the people vary, [illegible] there is a considerable quantity of cinders, in other parts [illegible]

With regard to the collection of the refuse, in most towns this is carried out by the corporation, the council's carts collecting the refuse during the day, and the town being usually divided into districts for this purpose. One visit per house per week is generally all that can be arranged, but two visits per week are preferable.

It is [illegible] for the refuse to be collected during the summer months at night, the carts leaving the depot about 11 p.m. and returning about 7 a.m., and this method should certainly be adopted in all health resorts. The disadvantage of this plan, of course, is that the noise of the carts as they rumble through the streets at night is somewhat disturbing to one's sleep, but the [illegible] the day quite outweighs this disadvantage.

In many towns the collection of the house refuse is let to a contractor, a method which I entirely disapprove, for the corporation can carry out this work more efficiently, and the fact that in some towns where the work was previously let to a contractor the corporation now do the work endorses my view. Not only so, but contractors, when their term for the removal of the contract expires, frequently put their price up very considerably, and that means usually that the work is let to a new contractor who knows nothing of the nature of the work.

In some parts of the country a good deal of the refuse is saleable. Mineral-water bottles, for example, can be sold; tins, if crushed, and put on rail, are bought; paper and cardboard, glass and crockery in some districts have a small value. It is never advisable for rags to be picked out and sold, for these are likely to convey infection.

It has been suggested that in laying out a new city each house should be connected up to a suction main, which would lead to the destructor, and that house refuse should be thrown into a hopper in the kitchen, which would be connected with the main; the refuse would thus be drawn by suction to its destination. Theoretically this is admirable, but many difficulties present themselves in practice.

In some towns it is the practice for the man who [illegible] to bring an empty bin and take away the full one. This is an advantage, for it obviates the nuisance of the refuse being blown about as it is being tipped into the cart or wagon.

VEHICLES USUALLY EMPLOYED.

Ash Carts.—The old-fashioned ash cart is still in use in many towns. This is usually fitted with a canvas cover, which is so arranged that it can be drawn over the piled-up refuse, and lashed down by means of cords. The disadvantage of this method is that while the cart is being loaded the refuse frequently blows off and litters the street, and in a very heavy wind it is almost impossible to prevent this. Carts of this type should certainly be fitted with indiarubber where the tail-board is placed, and it is better that the tail-board should drop into position vertically in a grooved frame rather than it should be hinged.

Covered Carts.—Instead of the canvas cover, ash carts are now made with a permanent cover, which may be raised or lowered as required, and this is a great improvement on the open cart with the canvas cover.

Covered Vans.—The Corporation of Leamington Spa and many other corporations have adopted the covered van in place of the canvas-covered ash cart, and these are admirable where the roads are fairly level, for they are capable of conveying about 3 tons of refuse. In a hilly district two horses would be required, and therefore it is not economical under those conditions to adopt the covered van.

Motor Vehicles.—These are in use in one or two towns in this country for the purpose of conveying the refuse to the destructor, and the power is usually derived from the burning of the refuse. In France this method has been largely adopted. The Municipality of Paris has a large number of motor vehicles engaged in this work. At Havre, Nancy, and other French towns these vehicles are in use. "The Fram" vehicle seems to have met with most favour on the Continent. We in this country have not adopted this method of conveying refuse to the destructor unless it be in an isolated case, but I have no doubt that we shall do so in the near future, although up to the present I have not been satisfied that there is any saving in cost over the ordinary horse-drawn vehicle, chiefly on account of the time the vehicle must necessarily have to stand idle in the street. For other municipal purposes it is admirable.

UNSATISFACTORY METHODS OF DISPOSAL.

Every local authority should consider which is the best and cheapest method of disposing of their town's refuse. In many towns this contains a large percentage of nightsoil, in others it contains none. Here and there throughout the country one finds the town's refuse being tipped in old quarries and disused brickfields. Such methods of disposal are far from satisfactory, for there is a danger of contaminating the water supply, and if not, to have a nuisance of this kind in the district must be injurious. In one of our Midland towns the household refuse is carted to the depot, where it is drawn up an inclined plane on to a strong horizontal screen of 2-in. mesh fixed at a height of 10 ft. above the ground level. On one side of the screen a furnace has been constructed, and into this paper, rags, &c., are thrown and destroyed. Two labourers working on the screen [illegible] bottles and old tins, the remainder of the refuse dropping through the screen. This is received on an inclined riddle of ¾-in. mesh, and the larger ash is deposited outside at the ground level, and sold to market gardeners for use as fuel in rhubarb-forcing sheds. The finer ash which falls through the riddle is deposited in a pit beneath. Tanks are constructed in the yard, and this ash with the addition of the nightsoil is converted into manure, which has a ready sale to farmers in the district.

In some places it has been the custom for the refuse to be taken direct to the farmers in the district, but it is only during certain periods of the year that this refuse is of any use to the farmer, and so, during many months of the year it has to be stored until the farmer is prepared to receive it.

The refuse in other towns is taken by rail direct to the suburbs, where it is used by farmers, market gardeners, and others. The loading and unloading of this is often a great nuisance.

In several coast towns, such as Dover, and other towns which are situated near the coast, such as Sunderland and Newcastle, a part, if not all, of the refuse of the town is taken to sea in barges, and there disposed of, but this method of disposal is a very objectionable one, its disadvantages being—(1) the system costs, with the purchase of barges, &c., as much as a refuse destructor; (2) during an onshore gale much of the refuse already tipped will wash ashore; (3) during a gale, which might last for a week, no refuse could be taken to sea, and therefore it would have to be stored somewhere; (4) the loading of the barges would, no doubt, have to be done from the piers of the harbour, and this would be an

intolerable nuisance. Not only at certain states of the tide, in most seaside towns, would the barges be able to get out of the harbour, but it is very doubtful if the Fishery Board will allow refuse to be tipped in the sea in the manner referred to when they really give this matter their serious attention.

It has often been suggested that a town council should purchase a piece of low-lying land, preferably of a clayey nature, well out in the country, and remote from the water supply of the town, or from any wells in villages, and use this as a tip for the refuse, and that they should purchase a traction engine with trailers to convey the refuse there. The disadvantages of this suggestion are that the rural district council would certainly object to the tipping of the town's refuse in their area, the cost of this method of disposal would be prohibitive, and when snow was on the ground the refuse could not be taken, but would have to be stored in the town for perhaps two or three weeks.

SORTING OF REFUSE IN THE HOME.

It has also been suggested that the refuse should be sorted in the home, and that separate receptacles should be used for receiving—(*a*) waste food, vegetable refuse, &c.; (*b*) ashes and dust; (*c*) other refuse, such as tins, broken glass, paper, &c. While this is very good in theory, in the actual carrying out of an ideal system of this kind many difficulties present themselves. This principle has been adopted in some towns in Germany, but has certainly not proved a success. The local authority can, however, be considerably helped by the housewife, if she will destroy by fire all the organic refuse of the house, so that there will be nothing to remove but ashes. This is an ideal state of things, but unfortunately the public have not yet been educated up to this standard.

DISPOSAL BY CONVERSION INTO MANURE.

There is great difficulty in disposing of house refuse to farmers, owing to the large quantity of paper which it contains, and which the farmer naturally objects to place upon his land. In order to pulverise refuse and make it useful as a manure a factory was erected at St. Omen (Pas de Calais) in 1896, and two further factories were erected—namely, at Issy-les-Moulineaux and at Romainville. Shortly after the farmers began to purchase this manure, and found it excellent; but after they had treated their land with it for three or four years they found that its beneficial effect had lessened—the land needed a change. They discontinued using the manure, and the companies failed.

PATENT LIGHTNING DUST MANIPULATOR.

This machine has been brought out by a British firm, and is undoubtedly the best of its kind.

The object of the plant is to treat the refuse so as to enable it to be used as a valuable fertilising agent. The plant may be described briefly as follows: A high-speed centrifugal-force disintegrator, pulveriser, and mixer of a simple construction, it costs much less than a destructor, occupies little room, requires only a moderate power to drive it, and any material capable of pulverisation is instantly disintegrated and pulverised; the machine is certainly a very useful one. The house refuse is tipped by the ash cart in front of the manipulator, and is then shovelled into the hopper of the machine. Almost anything can be treated, and a few seconds after the refuse is discharged into a cart or truck in the nature of a dark-coloured mould or manure. The refuse may contain rags, paper, cinders, glass, pots, bottles, or almost anything.

It was first adopted by the Southwark Borough Council, and one or two extensions of the plant there have since been made. On one occasion at Southwark 6 tons of condemned rabbits from Australia, 5,000 in number, and in their skins, were passed through the manipulator and promptly turned into manure.

Three of these machines are now at work at the depot of the Southwark Council, and a fourth has been installed as a reserve.

Prof. Matthews then proceeded to set out the advantages and disadvantages of using a plant of this kind, and showed that the only really satisfactory method of dealing with towns' refuse was by burning it. He named the points which should be borne in mind by a local authority and its engineer when finally deciding upon a suitable site, and upon any particular type of destructor. He gave many practical suggestions which added to the value of the lecture, and a number of these were illustrated by lantern slides.

The lecture was well attended, those present including Mr. H. Percy Boulnois, M.INST.C.E., and Mr. T. W. A. Hayward, borough engineer of Battersea.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

WAR COMMITTEE'S WORK.

The opening meeting of the session at the Royal Institute of British Architects last week was remarkable for its unusual brevity, the proceedings, which included a short address from the president, Mr. Ernest Newton, R.A., occupying barely half an hour.

On the outbreak of the war the institute formed, with the co-operation of other architectural bodies, a War Committee. "The machinery, being new, has," the president observed in the course of his remarks, "creaked a little; but I think I may say that it is now running smoothly and doing useful work. Subscriptions were also invited for the Prince of Wales' Fund and for relieving distress among architects caused by the war. The institute gave a donation of 100 guineas in August to the Prince of Wales' Fund. £239 11s. have now been collected, and £210 have been forwarded to the treasurer of the Fund as a first donation. We have been able to hand over £591 19s. 6d. for the relief of distress consequent on the war to the Architects' Benevolent Society, which proposes to open a special account for this purpose. The Professional Employment Committee, believing that it is better, if possible, to provide employment than to relieve by means of doles, is arranging a programme of work which might usefully employ men whose ordinary practice has come to a standstill; £162 8s. has been received specially earmarked for this purpose, and the committee hope to receive further financial support, not only from architects, but from the public generally. The Selection Committee is concerning itself in tabulating useful information with respect to special services that may be required by the Government, and in organising assistance to carry on the work of architects who have joined the Forces. They have already done most useful and valuable work."

MUNICIPAL EMPLOYEES AND THE WAR.

HOLBORN'S "SERIOUS POSITION."

Holborn Borough Council, which was among the public authorities who at the outbreak of war agreed that full pay should be allowed to all their employees on active service, had before it at its last meeting a proposal to call a special meeting with a view to the resolution on the matter being rescinded.

Colonel Smith said the resolution placed the borough in a serious position. When it was passed they did not know the facts. Since that time the Government had advanced separation allowances on a liberal scale, and women, according to the number of children, received up to £1 2s. a week, independent of their husband's Army pay. Consequently they were very much better off than when their husbands were at work.

A Voice: So they should be.

Councillor Fitzroy Doll said the Metropolitan Water Board were giving its men full pay. (Cries of "It is an extravagant body.")

Councillor Fitzroy Doll: And most private firms are also paying full pay. (Cries of "You are wrong!" "Half pay!" and "No, no.")

Ultimately the question was referred to the Law and Parliamentary Committee to inquire into how far the resolution could be altered.

Goods from Hostile Countries.—At the last meeting of the City of London Corporation the following motion was carried *nem. con.*: "That His Majesty's Government be asked forthwith to obtain power for the determination of contracts with companies for the supply of goods imported from any country with which this country is at war, or manufactured or partly manufactured in any such hostile country, and for the determination of contracts with companies which are or were, on and subsequently to the first day of January, 1914, under the management of, or a majority of whose directors or shareholders are or were, during the said period, born subjects of any such hostile countries."

Camp Sanitation.

(4.)—OBJECTIONABLE ORGANISMS AND MICRO-ORGANISMS AND THEIR DESTRUCTION.

By G. BERTRAM HARTFREE, [illegible], Engineer and Surveyor to the Alton, Hants, Urban District Council.

[illegible] necessary. A few months back a friend, who in private life is manager of an important business and [illegible] that, by some means, lice had obtained admission to [illegible] tents, [illegible] several of whom in private life were his personal friends, the greatest disgust.

The common flea (*Pulex irritans*) finds habitation in dirty houses, but, I believe, rarely survives in military tents, and is not a difficult creature to remove.

In billeting there is the risk in some quarters of [illegible] Should this creature appear in force, possibly a change of billet would be made, but a knowledge of the best means of destruction may be useful.

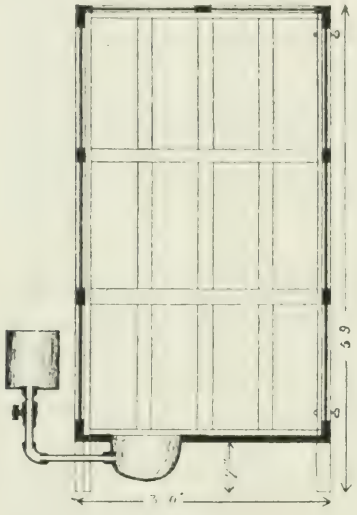

Fig. 1.

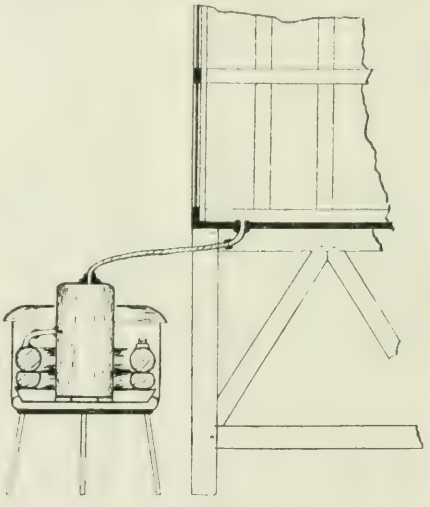

Fig. 2.

A common practice by men engaged in repairing property containing these creatures is "stoving" the rooms. This is done by lighting braziers filled with charcoal and brimstone, the fumes from which are claimed to exterminate the pest. Possibly this treatment is generally successful, but several years back I was consulted in respect to a cottage of good class which had recently been vacated by a disreputable tenant. A man had been engaged to "stove" the house, but a new tenant left hurriedly, having been driven out by swarms of bugs. I advised the use of sulphur candles; these were guaranteed effectually to disinfect 1,000 cub. ft. per pound, but the proportion used was 1 lb. to 500 cub. ft. After disinfection bugs were found dead; a quart measure was filled with those swept up, all being of a bleached appearance instead of their natural mahogany colour. On the expiration of a few days, the empty house was again inspected during an evening, and after fires had been burning several hours. A hurried exit was made owing to the presence of the enemy in force. On two consecutive days the floors were scrubbed with strong solutions of perchloride of mercury. (This is very deadly, and requires most careful handling.) For several months no more were found, and then by ones and twos they again appeared. Possibly these were products of eggs that had survived the disinfectant, as none of the adjoining houses at any time had contained any, and the township was remarkably free from the pest.

The following are destructive to bed bugs: (1) Red pepper sprinkled around; (2) paraffin oil rubbed on the ironwork of the bed prevents their crawling up; (3) a mixture of Scotch snuff in soft soap is useful for stopping cracks in the wall; (4) a ½ oz. of camphor dissolved in a pint of best vinegar is also claimed as a good remedy. Whatever cures are tried, eggs may hatch during the months of March and April, making a necessity of a second treatment.

The pests more commonly met with when troops have no opportunity of changing their clothes are three members of the louse family: (1) The head louse (*Pediculus capitis*); (2) the body louse (*Pediculus vestimenti*); (3) the most objectionable of all, *Phthirius inguinalis*. These creatures have the chameleon-like properties of adopting the colour of their host. An authority states that, under continual habitation, the head louse adopts the colour of the hair, the body louse on a European is almost colourless, except for a dark streak along the spine, Chinese lice are yellow, those on Red Indians are brown, while negroes have black lice.

When magnified all lice appear to have hooked claws somewhat similar in shape to those of the crab; in fact, *Phthirius inguinalis* is a close imitation in miniature.

Unfortunately, their power of multiplying is very great. Notter and Firth's "Hygiene" states that the female head louse lays fifty eggs, and the body louse is responsible for seventy at a time.

As the life cycle of a louse is from six to eleven weeks, and under especially favourable conditions maturity takes as little as three weeks, it will readily be seen what an alarming increase can take place. The difficulty of detecting the creatures is their colouration; observers state that they apparently affix themselves by their claws, and the adults rarely move; but the young are sent adrift to seek new homes.

The eggs of the head louse are attached to the hairs in a form known as "nits," while the body louse prefers woollen underclothing; the third specie select

hairy parts of the body (but not the head), and the eggs are found on separate hairs at the end furthest from the skin.

These pests ill[illegible] from [illegible] to death, [illegible] the eggs are said to remain [illegible] for a month.

[illegible] sleep where others have slept before; this should be [illegible] clothes as often as possible, and prevent clothes being mixed with that worn by others.

To destroy vermin in the head, in addition to fine combs, paraffin oil, benzine and turpentine are very useful; tobacco juice is also said to be very effective. For the body louse, heat is a very destructive agent, [illegible] ing affected parts may lead to further trouble, as the pests are stated to be "carriers" of various infectious diseases.

"[illegible]
And [illegible]

These well-known lines of Dean Swift's appear to [illegible] that their tormentors are getting an equally warm time; but as vermin are "carriers" of the micro-organisms that cause infective diseases, the presence of their smaller "fleas" adds to their danger.

The steam disinfectors in use in all well-equipped hospitals are, of course, the best means for the destruction of micro-organisms, but in camps and on the field some effective substitute must be obtained.

In designing a portable disinfector three points [illegible] A suitable [illegible] a steam or chemical agent; (3) lightness and portability.

A small but useful steam disinfector is described in the Red Cross Manual No. 4. This consists of a deal box lined with felt covered by zinc sheeting. Steam is generated in a wrought-iron boiler, and conveyed to the box through a flexible tube. Heat is obtained from a wood fire in a trench.

For chemical disinfection any tight-fitting box may be used; in the absence of a sound chest, air-tightness can be obtained by pasting paper over the cracks. Sulphurous acid, in either of the many forms on the market, or formaldehyde by the use of an Alformant lamp, may be adapted for use inside.

Two formaldehyde machines that are suitable for use when this disinfectant is required are the Trenner-Lee and the Lingner generators, both of which have the advantage that they can be used outside owing to flexible tubes that connect the machines through an aperture to the interior of the boxes or rooms. The Lingner type, with which I have had much experience, is considered by medical experts to be very effective. Heat is provided from methylated spirit burning in a ring containing asbestos. Immediately over the burner is a chamber containing water, which is converted into steam and forced into a second chamber containing formalin. About five minutes are taken to obtain the necessary temperature, and in ten minutes an area of 1,000 cub. ft. is filled with gas. Unfortunately the machines with which I have had experience are of German make, and I trust the vendors will adopt the suggestion made several weeks ago, and put a machine of British manufacture on the market.

When machines are not available, an efficient method, described in Notter & Firth's "Hygiene," may be used. This consists of pouring liquid formalin quickly upon fine crystals of permanganate of potash contained in a suitable metallic vessel. A vigorous action takes place in a few seconds, accompanied by a strong ebullition of the liquid and sufficient heat to form a large quantity of steam.

This method has a further advantage for camp purposes, as dry formalin may be used. A working solution can be made from the ordinary tablets crushed to powder and placed in hot water, which should then be brought quickly to boil, and the hot solution used in the same manner as the common liquid form. The authors state that from their experiments 100 tablets dissolved in a pint of water makes a solution equal to a half pint of ordinary formalin.

Several years ago, for purposes of adapting this method, I designed a cabinet which was brought to the author's notice. Colonel Firth, R.A.M.C. (former Chief of Aldershot School of Sanitation), stated at a meeting of the Southern Branch of the British Medical Association that where sterilisation could not be employed he believed this cabinet would be very useful, and 5 oz. of permanganate to 10 oz. of formaldehyde would create fumes sufficient for 2,000 cub. ft.

The cabinet was made to the following specification: All wood to be the best selected and seasoned [illegible] or any other defect. No panel to exceed 8 in. in width or 18 in. in length. All stiles and rails to be 2 in. by 1 in. finished dimensions. Panels to finish ¼ in. in thickness and fit in grooves not less than ¼ in. in depth. The centre panel at back to be glazed with one sheet of 21-oz. glass. Sides, back, front and top to be carefully framed, glued and wedged. Bottom to be 1 in. in thickness, glued and screw-jointed. The whole to be carefully fitted with rebated joints made by glueing and screwing ½-in. fillets. The top and bottom to be supported by sides, the back and front to fit between sides. Sides, back, top and bottom to be well secured together by stout screws, well greased before insertion and provided with brass caps. The front to be provided with four stout thumbscrews and sockets. A hole to be cut in bottom and an iron container to be fixed by an airtight joint. Connect an iron pipe, ¾ in. internal diameter, bend a brass cock to zinc cylinder outside cabinet. Fix stout hooks to underside of top. Provide two shelves consisting of pine 2 in. by 1 in., framed like a sash with fine mesh wire covering. Shelves to rest on wood fillets and be easily removable.

This cabinet is sufficient for the disinfection of an ordinary-sized mattress suspended from the top. By inserting the wire shelves, smaller articles can be treated.

The method of operation is to place potash crystals in the iron container, hang up goods to be disinfected, and secure the front with thumbscrews. Open the brass cock at back and pour in formalin, after which the cock must be closed to prevent gas escaping outwards. Successful formation of gas can be seen through the glazed panel.

For transport the cabinet may be unscrewed and packed in a space 5 ft. 10 in. by 3 ft. by 8 in. Fig. 1 is a section through a cabinet intended for formalin and permanganate of potash disinfection, and Fig. 2 shows the same type of cabinet intended for use with a formaldehyde generator in 1908. I had one of the former constructed by a local cabinet maker for the sum of £5, and it is still in use.

Ratione Tenuræ Roads.—At the last meeting of the Executive Committee of the County Councils Association the Highways Committee reported that they had given consideration to the following resolution, passed by the Annual Conference of Rural District Councils: "That, in the opinion of this conference, legislation is required to deal with the question of *ratione tenuræ* roads, either by defining the principles of the liability of the present occupiers, or by giving highway authorities power to take over such liability upon compensation to be fixed by a valuation, such compensation being paid by an annual sum over an agreed period of years, or in a lump sum down, at the option of the person liable." It was resolved that the Rural District Councils Association should be asked to explain in what respects they consider that the existing law is not sufficient.

Sewage Disposal at Bury.—In his annual report on the treatment of sewage and destruction of refuse for the year ended March 31st last the manager of the Bury sewage works, Mr. J. Bolton, states that the cost of purifying the sewage was £3,127, against £3,054 last year, an increase of £73. This increase is entirely accountable for in repairs to buildings and chimney. The cost per head of population works out at 12·69d., against 12·42d. last year. The volume of sewage treated through the precipitation tanks and filters was 885,003,000 gallons, and 220,000,000 gallons, estimated from frequent gaugings, through the storm-water tanks, making a total of 1,105,003,000 gallons, against 1,136,056,000 gallons last year—a decrease of 31,053,000 gallons. This decrease is brought about owing to the lesser rainfall in the year 1913. The average daily flow through the tanks and filters was 2,424,665 gallons, an average of 41·09 gallons per head of the population per day. This is exclusive of the amount passed through the storm-water tanks during wet days.

The Surveyors' Institution.

MR. CHATFEILD CLARKE'S PRESIDENTIAL ADDRESS.

On Monday evening last Mr. Howard Chatfeild Clarke delivered his opening address as President of the Surveyors' Institution.

In some introductory remarks on the events of the year Mr. Chatfeild Clarke said it was pointed out that, as the representative body of the land agency profession, it was fitting that surveyors should be found behind other Englishmen in their eagerness to serve their country. The lists which had been published, though necessarily incomplete, were an indication of the manner in which the profession had responded to the call, and this was demonstrated by the number of candidates for the institution examinations who had felt called upon to give up the desk for the field, and had withdrawn from the examinations at no small inconvenience to themselves.

The distress which must inevitably be caused by a state of war, and especially by a war involving so great a demand upon our resources, would be deep-rooted and widespread, and must, he feared, be felt in no class of life more acutely than among the professional classes. To those of their brethren who most felt the pinch, all who were in a position to do so ought to put the hand of friendship out to help them, to tide over the period of difficulty. For this purpose he need not say that money would be required, and he trusted that a generous response would be made to the appeal which was being issued on behalf of their Benevolent Fund, upon which the demands must necessarily be great. Those who undertook military service offered freely their lives for their country, and we who lived in security at home through their devotion must emulate their sacrifice by doing what was in our power to assist those who suffered from the effects of the war. A body known as the Professional Classes War Relief Council, composed of representatives of the great professional societies and bodies interested in social work, had been organised for the purpose of giving advice and co-ordinating the work already undertaken by the existing benevolent funds. The administration of these funds would remain entirely in the hands of those at present responsible for them, but it was hoped that the new council would prove of great value in supplementing their work.

Continuing, the president said his own work lay in urban areas, and he proposed therefore to confine his remarks more particularly to the problems which confronted those responsible for the better government of our teeming centres of population.

URBAN HOUSING.

Of the many questions to which urban surveyors must devote their thoughts—housing, public improvements, transit, sanitation, and so forth, all of which were so intricately connected that it was almost impossible to deal with one without reference to the others—the housing of our working population was the most important, and in many ways the most difficult. The two main agencies for providing housing accommodation for the working classes were the private investor and the local authority, while between these came charitable bodies, public utility and similar societies, and co-partnership associations. But by far the largest number of the houses of this class which were built were provided by private enterprise, a recent estimate placing the proportion as high as 99 per cent. It was therefore important to consider whether it was likely that the needs of the community would continue to be met through this agency.

Official figures showed that, during the past ten years the number of dwelling houses under £20 in annual value erected yearly had tended to decrease, although with the increase in the population remaining normal one might have expected a growth in the demand for houses parallel with the improvement in the general standard of living and better knowledge of sanitation, which should result in a reduction in the average number of persons per room. It would appear therefore that this form of investment was proving less attractive to the ordinary investor than was formerly the case, and a number of reasons for this were not difficult to find. In the first place there was the effect of the 1910 Finance Act, which it could not be denied had been considerable, in that, rightly or wrongly, builders, mortgagees and others had been unsettled by the fear that their profits or their security might be unnecessarily attacked. It would seem probable that the great falling off in the number of houses built during 1910-11 must to a large extent be attributed to the feeling that, by the operation of the Statute, this class of building had become more speculative, and this deterioration in the safety of the investment had been accentuated by the increase in the cost of building.

PRIVATE ENTERPRISE.

A third influence affecting the flow of capital for housing purposes was the cost of money. Housing accommodation for the working classes had in the past been provided largely by the speculative builder, who, in spite of the abuse which had often been showered upon him, had in fact carried out a useful public work in this direction. But, as a rule, his capital was small, and his operations had been carried on mainly by means of borrowed money, with the result that the interest he had to pay had a marked effect, in the first place on the price he must obtain for the houses he built, and in the second on the rent at which they could be let. For example, an additional 1 per cent. per annum on the capital employed in the erection of a house costing £250, inclusive of land, proportion of road construction and sewering, would necessitate an additional 1s. per week in rent, and unless that extra sum were likely to be obtained without much difficulty there would be a strong inducement for the capital to discover another outlet. There was also the undoubted effect which the great and continued increase in the burden of the rates must exercise upon building.

Apart from a small minority holding very advanced views, all would, he thought, prefer to see the provision of houses for our people undertaken by private enterprise, but few would agree that an attempt should be made to attract capital to this class of investment by reducing the standard of sanitation and amenity which has now been reached. Up to sixty years ago little control had been exercised over building; back-to-back houses were permitted, facing ill-ventilated courts, and conditions prevailed in parts of almost every large town giving rise to death rates in those particular districts quite double those found in the more favoured parts. There was now a tendency to place greater and greater responsibilities upon the builders and owners of house property, and while it was impossible to say that this should not be done a word of warning might not be out of place to the effect that such restrictions should be fair, reasonable, and free from any suspicion of faddism.

Private capital was a valuable ally, but at the same time it was one which was easily frightened; it was therefore worth an effort to secure it on the side of those who wished to see the people well housed. This was recognised by Mr. John Burns, who, in a circular to district councils issued at the end of 1912, said: "By-laws with respect to new streets and buildings are intended to operate in the interests of the inhabitants and to prescribe reasonable standards to which building development may fairly be called upon to conform with a view to securing stability, protection from fire, and healthy conditions, and it is obviously undesirable that the by-laws in any area should afford any ground for the suggestion that they are either unnecessarily restrictive or obsolete in character."

That circular, he ventured to think, was penned in the spirit which should govern all the relations between builders and owners on the one side and the sanitary authority on the other, whether touching upon by-laws, the provisions under the Town Planning Acts, or other matters. Every facility should be given for introducing new and cheaper methods of construction, and he was inclined to think that, in the less closely populated districts at any rate, so long as habitations were warm, dry, well ventilated, and sanitary, the requirements of the local authority should be looked upon as being fulfilled; and that too great weight should not be attached to the theory of structure. Houses, especi-

cially those occupied by the working classes, quickly became out of date, and, subject to the above essentials, it was desirable that it should be possible to "scrap" them when that time arrived, without too great a loss of capital

THE REAL DIFFICULTY.

So far as it was possible to foresee, it was unlikely that any real difficulty would arise with regard to the provision of the better class of working-men's dwellings—capable of being let at rents which, although varying in amount in different towns, paid a reasonable interest on the outlay. The real difficulty existed in providing house room, up to modern sanitary standards, for those who could not pay rents affording that requirement, and as it was essential that the people shall be housed, if one source of supply failed another must take its place.

Under the Labouring Classes Lodging-house Act, 1851, local authorities were first permitted to purchase, lease or erect lodging-houses for the working classes, and legislation had from time to time added to these powers, culminating in the Housing of the Working Classes Acts, 1890 to 1903, and the Housing, Town Planning, &c., Act, 1909. He should like strongly to urge the consolidation of those measures. The modern method of legislation by reference might have advantages when a Bill was being passed through Parliament, but the continued difficulty of interpreting a number of unrepealed measures all dealing with the same subject, which was thereby thrown upon those concerned in their administration, far outweighed the earlier and temporary advantage.

STREET CONGESTION.

Proceeding to discuss the question of travelling facilities in the great towns, the president observed that the development of tramways, railways and motor omnibuses had not been instrumental in relieving the congestion of the streets; indeed, in some cases where slow and quick traffic both made use of the same routes the difficulty had been increased. Bold schemes for future street widenings and for cutting additional wide new thoroughfares were often formulated, and would not lack support were it not for the financial questions which they raised; but it was clear that, however much we might wish to see them carried out, the cost would in some cases be prohibitive, while in others it could only be borne by dividing comprehensive schemes into parts and dealing with a portion only at a time.

The congestion at cross-roads was a difficulty which street widening alone could not prevent. He believed it was Sir John Wolfe-Barry who suggested sinking roads at junction points, so that one stream of traffic would pass over the other, and a number of crossings occurred to the mind where such a scheme might be carried out at reasonable cost, and would afford much practical relief. Indeed, subject to the engineering difficulties being overcome, it seemed possible that the solution of the problem in congested districts such as the City of London, where the value of property was so great that comprehensive street improvements became impracticable through the enormous cost, might be found in an extension of Sir John Wolfe-Barry's scheme by the formation of sunken roads under the existing streets to take the slow-moving traffic. He felt confident that the cost would be infinitely less than that of widening important thoroughfares for any considerable distance.

TOWN PLANNING.

To enable a test upon the subject, the president submitted the table in next column, prepared by the Local Government Board up to September 30th last, showing the town planning schemes proposed or under consideration at the present time.

It was satisfactory to see that the importance of this subject was not being overlooked, and at the same time that schemes were not being rushed through without due and proper consideration. The conferences which were now annually arranged between representatives of local authorities for discussing details in connection with town planning, and the principles which should govern that art, must prove of immense value in ventilating their subject, and in preserving our sons and grandsons from some of the disabilities under which we now suffered.

On looking back over what he had written, he felt that his remarks were open to the criticism that he offered no definite solution for the problems which he discussed; but his reply would be that great social questions could not at once be solved by a stroke of the pen, or even by legislative action, however well considered. Improvement could be effected only by progressive development and by the gradual amelioration of such conditions as became the subject of condemnation. Indeed, the continuous rise in the standard of living which could be followed throughout history, and which had become more marked during the past century, showed them that each generation set up ideals which it could never reach, as, happily, the ideals themselves continued to advance. He was therefore consoled at his failure to find a final solu-

Stage reached	Number of schemes.	Number of local authorities.	Acreage affected dealt with.
Schemes finally approved by the Board	1	2	9,068
Other schemes prepared by local authorities and submitted to the Board for approval	4	4	661
Schemes authorised by the Board to be prepared or adopted by local authorities	73	3	Unspecified
Applications for authority to prepare schemes under the consideration of the Board	30	27	97,855
Total	109	75 Separate local authorities.	106,975

Other cases in which the board have information that the preliminary notices have been given with a view to applications being made to the board for authority to prepare schemes	22
Other cases in which local authorities are known to the board to have had the matter under consideration ...	116
Number of separate local authorities included under all headings of the table	213

tion of these questions, and should be more than satisfied if any thoughts he had put before them bore fruit by stimulating a growth in the interest taken in these subjects among the coming generation, in whose hands the future advance would rest.

PAST-PRESIDENT'S DEATH.

Before resuming his seat the president said he had been much grieved to hear of the sad death of his predecessor in the chair. Mr. Edward Woolley was well known to them all, and he knew that they would feel how great a loss the institution had sustained in his death. He was a straightforward English gentleman, much respected and beloved by all who were thrown in contact with him, both in business and in personal matters, and he left behind him an example any man might wish to emulate. Thirty years ago Mr. Woolley's uncle was president of the institution, and he knew what a pleasure it was to Mr. Woolley to have succeeded to the chair nearly a generation afterwards. Their heartfelt sympathy was with his sons in their great loss, and their earnest hope was that future generations of the same family might be forthcoming in their day to carry on the noble tradition set by their predecessors.

Official Fire Tests with Treated Wood. The British Fire Prevention Committee have just issued their report No. 193 regarding a test carried out on July 1, 1914, with a match-boarded deal partition, where the deal was impregnated by a proprietary process with the object of making it fire-resisting. The partition comprised studs with ⅝-in. grooved, tongued and beaded match-boarding on both sides, and it measured 10 ft. wide by 9 ft. high. The test was conducted under the committee's usual conditions, and was a forty-five minutes' test at temperatures that rose to 1,630 deg. Fahr., whereupon water was applied from a steam fire engine. The main features in the official "Summary" of the test are that smoke appeared freely through several joints after thirty-eight minutes, and that after forty minutes' scorching appeared at several joints, and that after forty-four minutes a glow was seen at four points. Upon the application of water, water came through several of the vertical joints. The fire resistance was thus considerable for woodwork, although the minimum classification as to such a partition affording "temporary protection" under the British Fire Prevention Committee's Standards—necessitating resistance for forty-five minutes—was not obtained by a few minutes.

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain
Your maiden reason freely of his own
Concerning anything, or anybody.
—MASSINGER. "The Fatal Dowry," Act II., 2.

THE TRAINING OF MUNICIPAL ENGINEERS.

To the Editor of THE SURVEYOR.

SIR,—I cordially agree with [illegible] A Small Corporate Member [illegible] which he happens to be a member, is it possible to estimate the value of the education or training that a young fellow will receive merely [illegible] which he serves as a pupil.

Until one can guarantee that appointments are always made according to engineering ability, and not to influence or push, you will continue to find [illegible] reputations and positions depend upon the ability and work of their staff rather than on that of their own. On the other hand, it does not follow, because a man occupies the position of surveyor to a small town or district, that he is therefore without engineering experience or the ability to train young engineers, as Mr. Platt, from his evidence, appears to think.

May I give two cases in support of my argument, though I do not pretend that they are to be taken as average examples of what is to be found in large and small towns? They do, however, give point to my contention that it is unsafe to make too wide generalisations.

When a young man I was an engineering assistant in a town considerably larger than that over whose engineering destinies Mr. Platt so ably presides. The borough engineer was a member of the Institution of Civil Engineers, and, having a capacity for window dressing, was, with the aid of a large number of able assistants, able to make a very striking show of works carried out under his control. He had, like so many present members of the Institution of Civil Engineers, never received any training as an engineer, having started life in a builder's office, then for a few years followed the useful if not very successful trade of a purveyor of meat, afterwards became a road surveyor to a rural council, and ultimately borough engineer to a town of well over 100,000 inhabitants. Like Queen Elizabeth, he owed his success to his counsellors in the shape of his staff, and his very successful career only ended when he tried to dispense with their services, and attempted some engineering work on his own initiative. Every member of his staff had a shrewd idea of his abilities, and it is quite certain that not one of them would have cared to article their son to him. Still, the outside public, gulled by the string of letters after his name, and the importance of the town of which he was borough engineer, almost fell over one another in their eagerness to place their sons with him as pupils. At the time I was in his office he had six pupils, and his method of training them was evidently framed on the Pecksniffian model. The only training I ever heard that he gave any of his pupils was to put into their hands a volume on "Building Construction," with the margins plentifully marked with pencil lines, and tell them "to read that, for he had been all through it." I don't think he had ever set up a level in his life, and I am confident he could not read one brass on a chain from another. As a consequence, although he had a number of smart lads in the office, there is only one—and that, perhaps, not a brilliant example—who has made any success as a municipal engineer.

At the other extreme almost I may cite the case of a man who is surveyor to a small town, and who is quite "outside the pale" according to Mr. Platt, as he is not even a "small corporate member of the Institution of Civil Engineers." He has had, in the course of nearly twenty years' experience as a surveyor, some four pupils. All these four have passed the examination of the Institution of Municipal and County Engineers, and three of them got through the examination at the first attempt with no coaching beyond what they got from the surveyor. As a matter of fact, it was only the youth who studied under a coach who required a second attempt. One of these pupils also passed the Institution of Civil Engineers' examination for associates at the first attempt as soon as he reached the age of twenty-five, and again without a coach. I think this is a sufficient proof that [illegible] is not even a "small corporate member of the Institution of Civil Engineers." He has had, in the [illegible] which he happens to be a member, is it possible to estimate the value of the education or training that a young fellow will receive merely [illegible] which he serves as a pupil.

Until one can guarantee that appointments are always made according to engineering ability, and not to influence or push, you will continue to find [illegible] reputations and positions depend upon the ability and work of their staff rather than on that of their own. On the other hand, it does not follow, because a man occupies the position of surveyor to a small town or district, that he is therefore without engineering experience or the ability to train young engineers, as Mr. Platt, from his evidence, appears to think.

May I say how warmly I appreciate the broad views [illegible] Mr. Brodie placed before the committee, and add that I think the thanks of all municipal engineers are due to him for the able manner in which he stated their case?—Yours, &c.,

M.I.M. & Cy.E.

To the Editor of THE SURVEYOR.

SIR,—I have carefully read the whole of the evidence and schedule prepared by the Institution of Civil Engineers, and am personally of opinion the same is both interesting and instructive, since both Mr. Platt and Mr. Brodie are gentlemen at the head of their profession, and absolutely impartial. One point, however, that appears to me to have been entirely lost sight of in the schedule drawn up by the special committee with respect to the training of the municipal engineer is the entire absence of any reference to legal knowledge.

In my opinion, every municipal engineer is so continually involved in legal questions that it is most important he should have a groundwork of legal knowledge, which will enable him entirely to avoid the risk of accidentally involving his council in litigation.

The second point which occurs to me is with reference to small districts. Personally I am of opinion that a hard-working pupil trained in a small district, with a limited staff but a capable chief, is often more fitted to cope with the multifarious duties devolving upon the municipal engineer than the pupil in a larger district who is only an average worker.

I have personally had experience with good and bad pupils, and with men holding B.Sc. degrees, and I appreciate the difficulty set forth by Mr. Brodie in regard to the latter thinking certain office work utterly beneath their dignity, whereas the youth who enters the office from a public school, preferably after passing the matriculation examination only, realises that he must begin at the bottom rung of the ladder, and he thus obtains the benefit of office routine and practical detail more than the former.

In every case before taking a pupil I have warned the parent that it is only in the very large cities that every class of the work is fully dealt with, but that I will enable the pupil to have as wide an experience as possible while in my office, and will give him ample facilities for visiting other municipal works, and continuing his studies at evening technical lectures. My experience has proved that the pupil who takes advantage of this advice becomes very efficient, while the one who neglects to profit by it is a failure, and does no credit to himself or to his old chief.

I personally had the opportunity of having two years' experience with contractors in the workshops and upon outdoor works prior to becoming articled, and such period has proved of considerable benefit to the councils I have had the honour of serving.

My experience proves that every pupil or assistant should make himself not only efficient for the particular work upon which he may be temporarily engaged, but should continue his studies and qualify himself for a higher sphere, so that when a vacancy occurs at a better salary, there is no doubt as to his promotion.

Personally I am deeply indebted to my old chief, Mr. O. Claude Robson, of Willesden, for the greater

struction that the average municipal engineer may have time to give.

I have endeavoured to be as brief as possible in the above observations, although the subject opens

I am a strong believer in the necessity of a *viva voce*

ments and abilities, and as I have been examining students for nearly twenty years, I speak with some authority on this matter.—Yours, &c.,

E. Willis,

Town Hall,
W.
November 4, 1914.

To the Editor of The Surveyor.

Sir,—I was very interested in the report which I received on the above subject from the Institution of Civil Engineers a fortnight ago; and also in the letter of "A Small Corporate Member" in your last issue. [October 30th.]

In my case, a non-university town of 80,000, I insist that the intending pupil should be so far advanced as to have passed the Oxford and Cambridge Higher Local Examination, qualifying for studentship of the Institution of Civil Engineers, and that he shall also during his pupilage attend evening classes at the local technical college. If this were a university town, the standard I should set would be much higher, but a youth who has obtained an engineering degree in a university

pupilage in a town so much less than the one he is accustomed to. Every pupil is given full facilities for seeing and taking part in everything that is being done, and during his last year he is allowed to have charge of works from inception to completion, including drawings, quantities, supervision, and measuring up.

The problem seems to be one of "differentials," though perhaps not solvable by the calculus. There is—(*a*) The Engineer: He may be a man well worth his salt, able to organise and to teach, knowing his work, and doing it well; or he may be the man already described by Mr. Platt, "not qualified to teach, and his office not worth bothering about." (*b*) The Pupil: A youth studious, willing, and desirous of getting a practical engineering training, and obtaining the full value for the premium that his people have paid; or the youth referred to by "A Small Corporate Member," "an unmitigated nuisance who would neither work himself nor let anybody else work." (*c*) The Office: One so carried on that the assistants and pupils are put on to every class of work in turn as necessity demands; or one where the different classes of work are specialised (kept in watertight compartments, so to speak), and the assistants are kept on the same class of work year after year. And all the varying shades and grades in between these extremes in each of the factors!

Among the fables which appeared, under the title of "Æsop Modernised," in your columns some fourteen months ago there were two bearing very much on this side of the question (see pp. 319, August 29th, 1913, and 535, October 10th, 1913).—Yours, &c.,

H. Gilbert Wyatt.

Grimsby.
November 7, 1914.

To the Editor of The Surveyor.

Sir,—While I agree that "A man doing small work, if he is doing well, is often a good man," a pupil requires something more in being articled than being placed under a good man. The good man also should be able to offer the pupil sufficient experience and the backing of a known name.

From the point of view of a parent or guardian selecting a municipal engineer as the master for his son or ward, I think he will be distinctly on safer ground in choosing a member of the Institution of Civil Engineers than otherwise. He should further ascertain what experience will be available under

more varied in large towns than small, although in some large towns the departmental system discounts their other advantages.—Yours, &c.,

Arthur L. Collins, M.Inst.C.E.,
M.I.M. & Cy., &c.,
City Engineer, Norwich.

November 4, 1914.

THE FUNCTIONS OF A MUNICIPAL ENGINEER.

To the Editor of The Surveyor.

Sir,—I have read the report of Prof. Matthews' lecture on "The Functions of a Municipal Engineer" with interest, but am not clear upon one or two points.

(*a*) Why should the depth of a reservoir be limited to 30 ft., especially since Prof. Matthews later speaks of 35 ft.?

(*b*) Would Prof. Matthews consider a concrete composed of 4 parts gravel which had 33 per cent voids, and 2 parts sand which had 30 per cent voids, a well-graded concrete?

(*c*) My experience, after testing hundreds of concrete tubes, laboratory made and job made, is that 2,000 lb. per square inch at thirty days is a very high figure to expect, and cannot be obtained except with the best of aggregates, correctly proportioned, and an absolutely first-class cement; 1,500 lb. would be nearer for average concrete.

(*d*) According to my figures, a vertical concrete wall to withstand a 10-ft. head of water, using 600 lb. on concrete, and considering the wall restrained top and bottom, would demand a thickness of 8 in., to include covering for steel. I take it that, while "it is usually desirable to build counterforts of buttresses back of the wall," this is not absolutely necessary.

(*e*) Prof. Matthews says the weight of water on the heel of a cantilever wall should be neglected in design. This is probably considered necessary in case of possible upward water pressure. Is this true?

(*f*) A strength of 1,050 lb. per square inch at seven days was spoken of in the lecture. Is this the correct figure?—Yours, &c.,

H. C. Johnson,
Lecturer on Reinforced Concrete.

Engineering Department,
University College,
Cork.

November 9, 1914.

Corporation's Claim under Housing Act.—At Leamington Borough Police Court last week B. Dawson, 25 Regent-street, was the respondent in a claim made by the Mayor and Corporation of Leamington for the payment of £5 for work carried out under the Housing of the Working Classes Act. The town clerk (Mr. Leo Rawlinson) said the claim was for demolishing a house at the back of 3 Grove-place, in respect of which a closing order was made in February, 1913. The demolition order was made in July, and as the defendant had not done the work the local authority had the work carried out by contract for £5 in November. The Bench ordered Dawson to pay the claim, £5, and costs 9s. 6d.

Belgian Engineers.—At the ordinary meeting of the Society of Engineers held on the 2nd inst., the president, Mr. H. C. Shenton, made special reference to the presence at the meeting of about twenty Belgian engineers, and on behalf of the society gave them a hearty welcome. M. Pierre de Thier, membre de l'Association des Ingénieurs de Liége, who took part in the discussion, prefaced his criticism of the paper ("Uses of the Hydraulic Mining Cartridge," by Mr. James Tonge, M.I.Mun.E.) by a courteous appreciation of the hospitality offered by the Society of Engineers to their Belgian confrères. The offices of the society at 17 Victoria-street, Westminster, are open daily from 10 a.m. to 4 p.m. (Saturdays 10 a.m. to 1 p.m.), and Belgian engineers who are now in England on account of the war are cordially invited to apply to the secretary when they are in need of any information. Those who are unable to call are invited to send their names and addresses to the secretary so that they may be in touch with their colleagues and receive invitations to the meetings.

SHEFFIELD'S HIGHWAYS AND SEWERS.

DEPUTY CITY SURVEYOR'S REPORT.

[illegible] Mr. W. J. [illegible] has issued [illegible] the Highways and Sewers Committee [illegible] the year ended [illegible] 1902. [illegible] the total expenditure [illegible] £150,820, [illegible] £141,011 during [illegible] 1901. [illegible] Mr. Hadfield [illegible] the Committee [illegible] the Streets Committee [illegible] Road Board [illegible] the [illegible] the Corporation [illegible] abolished.

In order to judge of the effect of work done under [illegible] Board, [illegible] Mr. Hadfield says it is only necessary to examine certain thoroughfares and compare the [illegible] with those of three with the old macadam surface that still exists in some [illegible] the adjoining parish. A table in the report shows [illegible] the expenditure on the city boundaries in 1901 the expenditure on highways and sewers, and what it amounts to in the way of rates [illegible] a penny in the pound. There has been a [illegible] and the rate of expenditure is [illegible] the city was [illegible] the total [illegible] in the 5 counties with an average of [illegible] for the period of [illegible] years, the maximum having been 19·25d. in the year 1901-2.

It appears that bouldered streets have been re[illegible] during the year by more than 2½ miles, a rate of progress which, if maintained, will result in [illegible] of this class of paving existing at the end of another five years. Water-bound macadam has been reduced by about 10 miles, and tar[illegible] has increased to the same extent.

Wood paving has been extended from 12 to 12½ miles. About 1,000,000 wood blocks were until recently considered an average year's consumption in Sheffield. During the last two years, however, 3,341,784 new blocks and 531,470 renovated blocks—[illegible] 3,873,254 blocks, [illegible] quantity—have been laid.

TAR-MACADAM.

The quantity of tar-macadam mixed during the year was 22,205 tons—a total well in advance of any previous record. In last year's report many details were given with reference to the use of this material, and subsequent experience has not only confirmed, but emphasised the favourable conclusions then recorded. On three of the principal roads leading out of the city about 6 miles of tar-macadam have been laid at different times, some as long ago as 1911. Except in two places where the foundation gave trouble—and the extent of this was very slight—nothing has since been done except to tar and gravel the surface—in some cases even this has been unnecessary—and almost throughout the roads are in as good condition to-day as when they were laid. Mr. Hadfield has little doubt that in a few more years the saving in maintenance will have paid off the initial cost of the tar-macadam, while in the meantime the public is having the use of roads out of all comparison with those which previously existed. In dry weather there is practically no dust, and there has not been a load of mud to remove from any of these roads since they were tar-macadamised. In two other roads—over which there have been [illegible] tons of ordinary tar-macadam has now been laid in part for eighteen months, in part for a year. The sections laid eighteen months ago have sustained the whole of this traffic in addition to the other traffic using the road, and so far with complete success.

A trial of asphaltic pavement has been made in certain thoroughfares. "The paving," says Mr. Hadfield, "is particularly clean, and although a few complaints were received during the first few days of its use that it was slippery, careful observation of the traffic proved that accidents were almost non-existent. The surface of this material [illegible] a [illegible] and [illegible] a [illegible] party of graver, which furnishes a reasonable foothold for horses, without creating dust. At the time of writing this report arrangements were being made for laying further areas of similar pavement. In one street the asphaltic surface [illegible] the top of the existing [illegible] paving. This pavement was [illegible] complaints during last winter, owing to [illegible] traffic [illegible] picking up mud from the [illegible] and [illegible] from the [illegible]

[illegible] WORK.

During the last six years nearly 52 miles of modern [illegible] have been laid in place of old rubble or stone culverts. The work is still proceeding, and, [illegible] a new [illegible] has lately been discovered.

It might have been expected that as defective rubble sewers were replaced by self-cleansing sewers the cost of cleansing and flushing would diminish. To some extent this has been the case, but, as Mr. Hadfield points out, the present tendency is for the public to become more critical towards matters which a few years ago would have received little attention. "Consequently more and more attention [illegible] paid to [illegible], and, though at present the cost is [illegible], it may be taken that the work [illegible] being more thoroughly and systematically done."

During the year 1,416,637 gallons of water were used for flushing purposes, representing approximately 8,311 flushes, an average of about 28 per day for 300 working days.

SICKNESS AND LOST TIME.

Some [illegible] appear under this heading. The average amount of time lost through bad weather during the two months was 1·3 hours per man per week, equal to the whole time of about thirty-three men, or 2·7 per cent of the whole of the employees. The average amount of time lost through sickness amounted to about three hours per man per week, 35 per cent more than in the preceding year. The average number of men absent through this cause was about seventy-three, or 6 per cent of the whole of the employees, permanent and casual. Through preventable causes the men have lost during the twelve months 88 hours per man per week.

PRO PATRIA.

[TENTH LIST.]

We present herewith a tenth list of municipal engineering and sanitary officials who are taking part in the war, and shall be glad to hear of other cases within the knowledge of our readers.

Barker, Herbert M., articled to his father, Mr. Herbert W. Barker, surveyor to the Walmer Urban District Council, Royal Engineers (Territorials).

Bowen, E. J., clerk, Malvern Urban District Council, 8th Batt., Worcester Regiment.

Clowes, W. L., borough surveyor's office, Devonport (late of Stoke-on-Trent), Royal Army Medical Corps (Territorial); for the time stationed at the 4th Southern General Hospital, Plymouth.

Coombs, W. A., assistant chemist, gasworks, Malvern Urban District Council, Royal Army Medical Corps.

Fraser, Angus, assistant surveyor, Malvern Urban District Council, sergeant, 2nd S. Midland, R.F.A.

Jackson, J., clerk, borough engineer's department, Wrexham, North Wales "Pals" Battalion.

Layton, F., clerk, Malvern Urban District Council, bombardier, 2nd S. Midland, R.F.A.

Prydderch, R. J., assistant, borough engineer's department, Wrexham, North Wales "Pals" Battalion, Royal Welsh Fusiliers.

Richards, E. P., M.INST.C.E., M.R.SAN.I., F.G.S., formerly Government City Engineer of Madras, and chief engineer to the Trustees for the Improvement of Calcutta, Lieutenant, 7th (Service) Battalion Leicestershire Regiment, Badajoz Barracks, Aldershot.

Slack, N., clerk, Malvern Urban District Council, gunner, 2nd S. Midland, R.F.A.

Wade, Percy, deputy town clerk, Middleton, 2nd City Battalion ("Pals") Manchester Regiment.

Whitehead, H. M., [illegible] Carnforth Rural District Council, Captain, 7th Batt., Notts and Derby Regiment, the Sherwood Foresters.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. *Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.*

QUESTIONS.

This week answers are invited to the following questions:—

436. Ventilation. What effect has (*a*) the breathing of animals and (*b*) the combustion of fuel upon the purity of the atmosphere? (T. R.)

437. Underpinning. A curved column in a church is showing signs of settlement. Describe, with sketches, the method of timbering and underpinning it. (L. C. B., *Chester*.)

438. Strength of Materials.—If a straight prismatic beam of timber floats in a horizontal position with a weight of *w* lb. per unit run attached to each end, what will be the bending moment at the centre of its length?

439. Stability of Wall.—How high may water rise on one side of a vertical wall, 9 ft. high 2 ft. thick, of material weighing 143 lb. per cubic foot, before the resultant force at the base of the wall passes outside the middle third?

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

433. Mechanics.—Show how to find the periodic time of one complete vibration in a case of simple harmonic motion, and give a proof of the necessary formula.

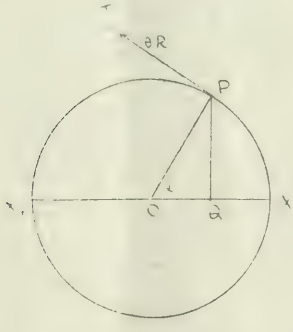
The periodic time of a complete vibration in a case of simple harmonic motion is given by the formula—

$$\text{Periodic time} = 2\pi\sqrt{\left(\frac{\text{displacement}}{\text{acceleration}}\right)}$$

The proof is as follows:—

Let the point P be describing a circle XPX, with a uniform angular velocity θ. Let XOX, be a fixed diameter, and let PQ be a perpendicular let fall from P to XOX, meeting the latter in Q. Draw OP, the radius of the circle XPX,, and let it be called R. Let angle POQ = α.

In the first place, we have to prove that the motion is simple harmonic. From the figure we have



The velocity and acceleration of Q = the parts of the velocity and acceleration of P resolved parallel to XOX,; also, since P is describing a circle, acceleration of P = θ^2R along OP.

Acceleration of Q = θ^2R cos α = θ^2OQ.

This expression varies as OQ, that is, as the distance of point Q from the fixed point O. The motion is therefore simple harmonic.

Now the velocity of Q = θR sin α = θPQ, and if OQ be made equal to $\frac{1}{\theta}$ velocity of Q = $\theta \times \frac{1}{\theta}\sqrt{(R^2 - \ldots^2)}$.

Thus, at X, and X the velocity of Q is zero, and at point O it is θR.

We see, therefore, that Q starts from rest at X, attains its greatest velocity at O, is once more in equilibrium at X,, and returns to X in a similar manner. Now to find an expression for the periodic time, we have:

Time of Q from X to Q = time of P from X to P

$$\frac{\alpha}{\theta} = \frac{1}{\theta}\left(\cos^{-1}\frac{\ldots}{R}\right)$$

and time from X to X, = $\frac{\pi}{\theta}$

∴ time from X to X, and back to X = $\frac{2\pi}{\theta}$

and this expression gives us the periodic time, and we have—

Acceleration = θ^2OQ = θ^2 × displacement.

$$\therefore \theta^2 = \frac{\text{acceleration}}{\text{displacement}}$$

$$\therefore \theta = \left(\frac{\text{displacement}}{\text{acceleration}}\right)^{\frac{1}{2}}$$

$$\therefore \text{Periodic time} = \frac{2\pi}{\theta} = 2\pi\sqrt{\left(\frac{\text{displacement}}{\text{acceleration}}\right)}$$

(E. K., *Hayes*.)

435. Damp Prevention.—Show by sketches three methods of preventing moisture in the soil from rising into a brick wall: (*a*) an ordinary 14-in. wall, (*b*) a 16-in. cavity wall, (*c*) an 18-in. basement wall.

The precautions which have to be taken to prevent moisture in the soil from rising into brick walls are, to a certain extent, governed by building by-laws. The following is an abbreviated extract: "Every new public or domestic building shall

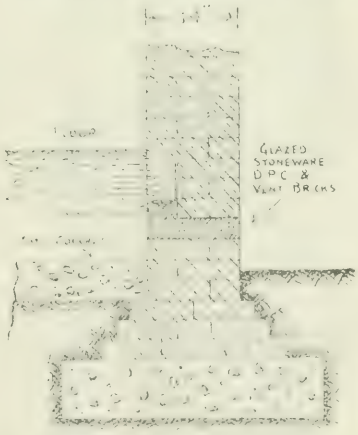


FIG. 1.

have in every wall a proper damp-proof course of sheet lead, asphalt, slates properly lapped and laid in cement, or other durable material impervious to moisture, beneath the level of the lowest floor timbers, and at least 6 in. above the ground adjoining." Fig. 1 shows the method adopted for ordinary walls. Glazed stoneware perforated bricks are shown, which act as a damp-proof course and as ventilators for the floor timbers. Fig. 2 shows the method for

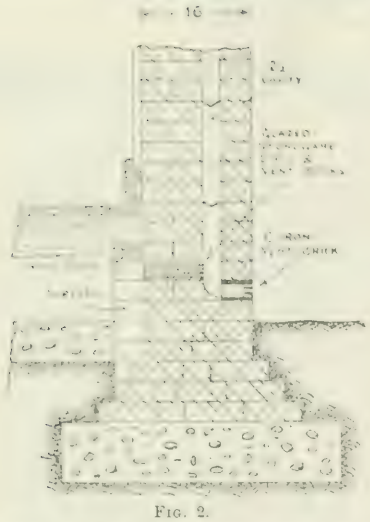

FIG. 2.

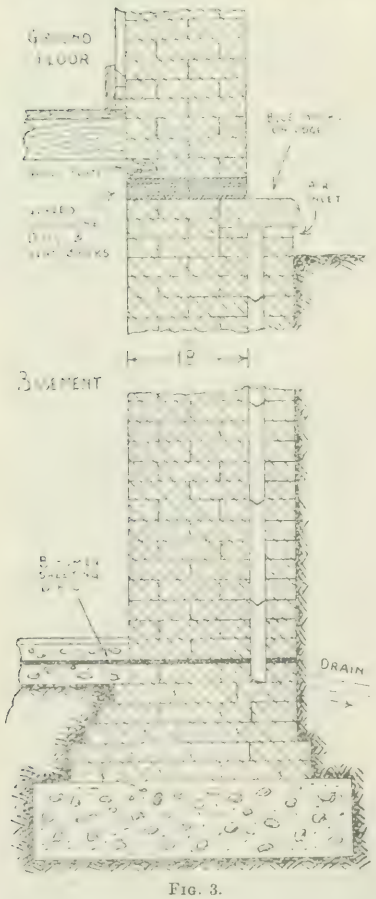

FIG. 3.

tied together at least every 18 in. vertically and 3 ft. horizontally. The site is also shown covered with

SOME NOTES ON ACHORUTES PURPURESCENS.

By G. BERTRAM KERSHAW, M.A.M. [illegible]

Most [illegible] sewage works is familiar with the [illegible] appearance, like sheets of fine black soot on the surface of any pools of sewage liquor, and on the filtering or contact material during the warmer months of the year. At times the cast-off skins of these insects, together with the newly-moulted ones, appear like white bran on the surface of the filters.

Until comparatively recently this insect was regarded as *Podura aquatica*, but from recent work on the insect it appears that, although belonging to the family of *Poduridæ*, the vast majority of these [illegible] belong to *Isotoma viridis*.

I am indebted to my brother, Mr. J. C. Kershaw, F.Z.S., for the following notes on the insect:—

SUB-ORDER—COLLEMBOLA.

Fam. *Poduridæ*.

Gen. *Achorutes*.

Achorutes purpurescens (Lubbock).

Antennæ, 5-jointed, short; feet with two claws; two clawed hooks at extremity of abdomen; eyes not in a black patch; body covered with short, whitish hairs. Length given as 1/8 in. (Lubbock), but very variable. Saltatory appendage two-jointed agrees exactly with description. General colouring agrees with description given in monograph of the *Collembola* and *Thysanura* (Lubbock, p. 181. Pl. XVI., Ray Soc., 1873).

Mr. Kershaw also reports that of many hundred *Collembola* taken haphazard at the South Norwood sewage [illegible], over 95 per cent were *Achorutes purpurescens*.

It appears from his investigations that these insects will feed upon green algæ, humus from contact beds and percolating filters, also upon the sewage fung. *Cephalosporium lachmanni* and *Sphærotilus natans*, while in captivity they will feed voraciously on damp blotting-paper, even when supplied with plenty of the above-mentioned foods. They were sometimes observed to eat the dead bodies of their own kind, so that they will in all probability eat any vegetable or animal matter, especially when decaying; the favourite natural food, however, appeared to consist of humus.

The food of these insects is of considerable importance in view of the clogging of filters by growths and organic matter, a point to which Mr. H. D. Bell drew attention at the Stratford-on-Avon sewage works some time ago.

It would be most interesting if experiments could be carried out with a view to ascertaining the actual weight of food-matter destroyed on the average by each insect, and, inferentially from this, the importance of numbers of these insects on contact beds and percolating filters from the practical point of view.

Such experiments would be most complicated, no doubt owing, among other things, to the question of variable moisture in the food supply, rendering delicate weighing operations very difficult.

Again, against food material devoured would have to be set matters excreted by the insects, so that the subject is a complex one.

The eggs are laid in random heaps in damp places on the filtering or contact material, also on the adjacent walls, at about the same level as the surface of the filtering material.

Several female insects sometimes lay in the same heap, and therefore the number of eggs in a batch varies from ten or twenty to several hundreds. They hatch in about ten days.

The Surveyor
And Municipal and County Engineer.

BUILDING INDUSTRY AND THE WAR.

By E. C. P. Monson, F.R.I.B.A., F.S.I.*

Is it possible that we may have become too engrossed [illegible] individuals, and that this war may provide an opportunity of getting, as it were, outside ourselves, and consequently obtaining a better perspective view of things as they really are, and of restoring that sense of their proper proportion as seen from a different and more independent standpoint?

The building industry, with which the architectural profession is so closely allied, is one of the first to feel the pinch. The state of the money market, the increase in prices, the difficulty of obtaining material, and many other questions arising, naturally affect the building owner, and through him the architect and the contractor, and it can only be by the most careful thought and nursing that contracts now running can be brought to a successful issue. Unfortunately the prices at which jobs have recently been tendered for have been so "cut" that any little unforeseen extra, to say nothing of large ones, which naturally makes the matter worse, must rapidly eat up the profits and tend to turn what might have been a margin on the right side into a bad loss. Any loss in this direction must naturally fall upon the builder and be a matter of most serious consideration to him, and often cause him some uneasiness. All this coming as it does so soon after the disastrous strike or lock-out in London, and the sectional strikes in many provincial centres, only emphasises the trouble and adds "insult to injury."

Personally, I have had no trouble with contracts which were in hand when the war started, and builders are doing their best to get on with them—and I do not anticipate any extras—but, I think it is only fair, if the job is genuinely proceeded with, that an extension of time should be allowed to the contractor, and that the penalty clauses should not be too strictly adhered to because of the great difficulty which is being experienced in obtaining some kinds of materials.

In the case of one large contract for which the tender was accepted before the war, but which the contractor would not proceed with owing to the causes mentioned above, the matter was settled and the contract signed upon my clients agreeing to pay an additional sum to cover the extra cost of material [illegible] the tender. Such extra sum in total is not to exceed 5 per cent of the total cost of the job, and is to be the subject-matter of a separate certificate at the completion of the contract, upon ocular proof being demonstrated to me that the extra prices have been actually disbursed.

In small jobs I have not found that prices have been so materially affected [illegible] out of the work impossible or unremunerative. In many cases, I am only too sorry to say (for unfortunately I sometimes have been guilty of it myself), when making out the preliminary estimates of the cost of the works to submit to one's client, sufficient notice has not been taken of the increasing stringency of Building Acts and by-laws, and of the enormous advances in the price of labour and the cost of material, which, taken with the rise of insurance premiums for employers' liability, unemployment, health, and such like burdens, all, however, very useful and necessary in their way, have in the last twenty years or so, in my opinion, raised the price of building work some 40 per cent, and even in the last few years by as much as 15 per cent to 20 per cent. Consequently the client has been given a false impression of what he would be called upon to pay, and been dissatisfied when the tenders arrived.

TIMBER SUPPLIES.

I think in a few months' time when timber ports are fully open again, and either the old or new markets are available for the purchase of materials which have inordinately increased in price, that no difficulty will be experienced in building works, for already the cost of some materials which rapidly went up has dropped considerably.

Should, however, such optimism not be realised, then it will surely be time for H.M. Government to step in and fix a minimum price for the respective materials (as has been done with success in the case of food), so as to prevent grasping merchants and importers from making an inordinate profit and crippling the industry of the country, thereby causing serious unemployment to the detriment of the community at large.

HOUSING SCHEMES.

What is our good friend the Chancellor of the Exchequer, the Right Hon. D. Lloyd George doing? He very generously promised a sum of £4,000,000 to be spent at once in housing schemes. This could now be readily applied and would be an enormous help, not only to the architects, who, by the bye, would only receive a very small part of it, but also to the workers in the building and allied trades. Moreover, it would supply that much needed provision of housing which is so abundantly required, and which is so anxiously being begged for in all parts of the land.

I recently saw a notice that housing schemes were to be sparingly prepared, but I cannot think that the promised sum has yet been earmarked or spent, and to my mind the sooner a start is made with it the better. Unfortunately the rate of interest charged by the Public Works Loan Commissioners has been raised from 3½ per cent to 4 per cent, which, of course, will make a lot of difference in the preparation of housing schemes, and I am afraid in some cases will cause the houses either to be let at rents greater than the people can afford to pay so as to show an adequate return in the nett outlay, or else the places must be let at an uneconomic rent and then the ratepayers at large must make up the deficiency, which is not a proper course to pursue. I sincerely hope it will be possible to keep the rate of interest down so as to enable the housing schemes to be proceeded with.

One result of the war will, I think, be the impressing upon all concerned the necessity of the most rigid economy and reorganisation of methods of building, as well as the standardisation of materials used, though not necessarily so as to make every street of houses appear as if they have been built from a box of bricks, or even cast in the same mould. This monotonous effect when it is resorted to is always sure to be depressing and to give dissatisfaction, and what an architect has to aim at is greater elasticity and freedom in his design, but not necessarily a searching after exaggerated effect which unfortunately very often produces monstrosities. It must be remembered that by pleasing the eye in the matter of building one undoubtedly improves the mind.

* Extract from Presidential Address delivered before the Society of Architects last night.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

COUNCIL MEETING.

[illegible] meeting of the Council of the Institution was held on Saturday last at the Institution of Civil Engineers, Great George Street, Westminster, when there were present: Messrs. J. S. Price (president), W. N. Bell, H. F. Bennett, J. S. [illegible], J. [illegible], W. Harper, J. Harris, J. W. A. Hayward, W. H. [illegible], J. E. Mackie, W. H. Prescott, N. Scarth, W. Scott, E. J. Tipper, H. F. Whitelegge, C. F. Wike, O. F. Wilson, and the secretary (Mr. [illegible]). Apologies for absence were received from Messrs. J. A. Brodie, J. W. [illegible], R. H. Dring, F. Mercer, and H. E. Stilgoe.

THE MARRIAGE BAR.

The following members were elected:

Messrs. Mr. J. A. Brodie, surveyor and engineer to the Bedwellty Urban District Council; J. Dodson, engineer and surveyor to the Bedwas and Machen District Council; E. L. Mercer, surveyor to the Whitstable Urban District Council; and R. Millar, burgh surveyor, Greenock.

Messrs. Messrs. G. W. Lawrence, [illegible] engineer and surveyor to the St. Neots Rural District Council; E. E. Williams, engineering assistant to the borough surveyor, Newport, Mon.; and E. L. Davis, chief assistant to engineer and surveyor, Llantrisant Rural District Council.

Mr. G. Stevens, [illegible] to the Dorking Rural District Council.

The Vice-Presidential Address to Member Mr. H. Wood, deputy city engineer, Norwich.

DEATH OF MR. W. B. BRYAN.

It was resolved to send a letter of condolence to the relatives of the late Mr. W. B. Bryan.

UNIFORMITY OF TENDER FOR SANITARY PIPES.

It was resolved that a deputation from the Builders' Merchants' Alliance be received, and that the secretary be authorised to arrange a date and time.

INSTITUTION MEETINGS.

It was resolved that the president be asked to arrange a meeting at which a paper by Mr. Scarth Wood on "Building By-laws" might be read.

HONORARY MEMBER.

It was resolved that Sir A. R. Binnie be asked to allow his name to be added to the list of Honorary members of the institution.

PREMIUM SCHEME, 1914-15.

In view of the large number of the junior members on active service, it was resolved that the premium scheme for 1914-15 be as follows: Three prizes of £5 5s., £4 4s. and £3 3s. respectively for the three best original papers read at a meeting in connection with the institution, or published in the *Journal*, the council reserving the right to withhold all or any one of the prizes in the event of no paper of sufficient merit being presented.

VACANT APPOINTMENTS.

The secretary was authorised to make arrangements [illegible] the publication of particulars of vacant appointments.

NEW ZEALAND EXAMINATION.

It was resolved that an examination be held in New Zealand provided at least four candidates present themselves, and that suitable arrangements can be made.

ADDITION TO BOARD OF EXAMINERS.

It was resolved that Mr. J. Walker Smith be added to the Board of Examiners.

CHAS. JONES MEMORIAL.

The reply from the relatives of the late Mr. Chas. Jones was received, and it was resolved that a Charles Jones Memorial Prize be established, and that it be referred to the Finance Committee to consider as to the method of the utilisation of the fund for this purpose.

Institution of Water Engineers.—The annual winter meeting of the institution will be held on Friday and Saturday, December 11th and 12th. Members and others interested are requested to reserve these dates and do their best to secure a good attendance.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Is it a matter of surprise that our law courts [illegible] the judges sit in courts which would make excellent [illegible] that the passages in [illegible] the smaller rooms are constructed like monks' cells, and that the refreshment rooms are in the crypt? How many of the older public buildings in London were designed to suit the purposes to which they were intended?

* * * *

Is it not to be hoped that the colossal new buildings for the housing of the London County Council will be found exactly suitable for the purposes they are designed to meet and how long ago it was since they were designed? Which is going to last the longest, the [illegible] or the [illegible] of this building?

* * * *

I see London is to be [illegible] on the splendid [illegible] of the celebrated London Scottish Regiment. What does the Kaiser now think of our small "Citizen Army"?

* * * *

Are not the claims of the "Professional Classes War Relief Council" worthy of the support of those who hold permanent appointments which are not affected by the war? Should their more fortunate brethren not try and assist those professional men who, from no act of their own, are beginning to feel the stress of "hard times"?

* * * *

Was not the applause which followed the president's announcement at the first meeting of the Institution of Civil Engineers the other night, that the name of his Imperial Majesty the German Emperor had been struck off the list of honorary members very significant? Are there not still left some German members of the institution whose names might equally well be removed?

* * * *

Was it not rather [illegible] to learn from the presidential address that whereas fifty years ago the railway companies were carrying their passengers at the rate of one passenger per half a ton of dead load, it now requires 3 tons of dead load per passenger? Do we realise that the present comfortable manner in which we travel is very costly to the railway companies, and that they have managed so well that railway fares are much less than formerly?

* * * *

Would it not be possible to draw the attention of the War Office or other authorities to the value of Mr. Hartley's articles on camp sanitation and similar matters now appearing in THE SURVEYOR? Would not these, if circulated among certain units [illegible] be a great benefit to the officers and men?

* * * *

What steps, if any, will the council of the Institution of Municipal and County Engineers take with reference to the report on the "Practical Training of Engineers" recently issued by the Institution of Civil Engineers? Will they endorse it without any suggested alterations or amendments, or will they consider that it thoroughly meets the case? Will not the members expect some pronouncement from the council on this important question?

* * * *

Does it not speak well for the British people that, notwithstanding the gigantic war in which we are engaged, their daily avocations appear to go on much as usual? Does not the action of the various municipal authorities in proceeding with works and offices set an excellent example to the community?

City of London Sanitary Company: Donations to Library.—Staff Sergeant Drayton, on behalf of the men of the 1st City of London Sanitary Company, R.A.M.C. (T.F.), begs to thank the following publishers for the very generous donations of technical books which they have made to the company's library: Messrs. J. & A. Churchill; Crosby Lockwood & Son; Longmans, Green & Co.; E. & F. N. Spon, Limited; B. T. Batsford Limited; Gale & Polden; St. Bride's Press, Limited.

Law Notes.

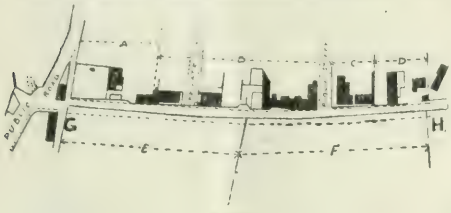
EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, *accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de plume." Where necessary, copies of local Acts or documents referred to should be enclosed.* All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction (*i.e.*, without re-drawing or amendment). *Unless these conditions are complied with we cannot undertake to reply to queries.*

QUERIES AND REPLIES.

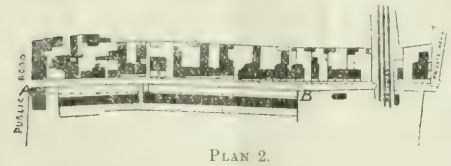
"In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

WIDENING STREETS. "H. H." writes: Have a borough corporation a power to make (or enforce making) roads which are 18 ft. and 16 ft. wide respectively into 36-ft. streets to comply with the by-laws, as shown on the drawings forwarded herewith. Plan No. 1. The existing roadway from G to H was originally a road to the land, and averages about 18 ft. wide. The corporation have from time to time allowed buildings to be erected adjoining this roadway as shown. The corporation now wish to make



PLAN 1.

this street 36 ft. wide in compliance with the by-laws. Owners of the land E and F agree to give up the land to make this street 36 ft. wide, and pay half the cost of street charges, according to frontage. Owners B and D also agree to pay half the cost of street charges. Owners A and C object, and state they are only entitled to pay for one-half of the existing roadway, which is only 18 ft. wide. Have the corporation any power to make owners A and C pay for half the cost of a 36-ft. street if the corporation carry out the work? Plan No. 2. This is a similar case to the previous one, with the exception that both sides of the road are built upon. The property on one side belongs to one owner, and the widening to make a 36-ft. street can only be taken



PLAN 2.

off this side (A to B). The owners are prepared to sell the land and cottage at the top of the road, but the numerous owners on the other side of the road state that they are not prepared to pay more than for half cost of the existing road, which is about 16 ft. wide. In this case would the corporation have power to purchase the land and apportion the cost with the street charges, according to frontage. I forward copy of the by-laws of the corporation. The corporation have made application to the Local Government Board to adopt the Public Health Amendment Act, 1907. I also forward a copy of a clause in the Corporation Private Act of 1914, which, I think, bears on the points in question.

[CLAUSE IN CORPORATION ACT, 1914, ABOVE REFERRED TO.]

54. (1) When a road or lane within the borough is about to become a new street within the meaning of the Public Health Act 1875 but the land on only one side of such street has been or is about to be built upon the corporation may instead of requiring the owner of the land built on or in course of being built on, to widen such road or lane to a width prescribed by the by-laws in force in the borough require such owner to widen such road or lane so as to give a width of not less than one-half of such prescribed width from the old centre line of such road or lane to the boundary thereof adjoining such land. (2) Provided that if and when the land on the opposite side of such road or lane shall be in course of being built on or prior to the corporation approving plans for the erection of buildings upon the land on such opposite side the owner of such land shall subject as aforesaid complete the widening of such road or lane so as to give the complete width prescribed as aforesaid.

Plan No. 1. Assuming that the existing road is not repairable by the inhabitants at large, the council can, in my opinion, make up the whole road when it has been widened by the inclusion of the land to be given up by E and F, and apportion the cost among all the frontagers according to their frontage. Plan No. 2. In my opinion the cost of making up the whole street, when widened, can be apportioned among the frontagers in this case also, assuming, as before, that the existing road is not repairable by the inhabitants at large. The purchase of the land and cottage can be effected by the corporation under sec. 154 of the Public Health Act, 1875, but the cost cannot be charged to the frontagers.

CONTRACT. ARBITRATION CLAUSE. "Resident Engineer" writes: A contractor has carried out certain works for a council under contract, one of the clauses of the general conditions being: "Should any difference or dispute arise between the clerk of works and the contractor relating to any matter in the execution of the works, such difference or dispute shall be referred to the engineer, and his decision shall be final and binding on all parties." And in another clause it states that, should any dispute arise, the engineer shall be the arbitrator to settle such dispute. The matter is now in dispute over several points, and the engineer proposes to act as arbitrator. Is the contractor correct in saying that, at the present time, according to the recent decision of the courts, the engineer, being an interested party, cannot act as the arbitrator? Kindly state the names of the various cases bearing upon this subject, and where and from whom can the querist obtain a full report of such case or cases giving the last judgment on the matter.

The contractor's statement that "the engineer cannot act as arbitrator" is too wide, and is probably based on a misapprehension of the effect of the decision in the case of *Freeman & Sons* v. *Cheadle Rural District Council* (Law Reports, 1911; 1 King's Bench, p. 783). In that case a firm of contractors brought an action against the council for money alleged to be due under a contract for works. The contract contained a clause making the council's engineer arbitrator, and the council applied to the Court to stay the action on that ground (so that the engineer might decide the matter as arbitrator). The contractors challenged the engineer's conduct, and the Court, not being satisfied that there was no sufficient reason why the matter should not be referred—*i.e.*, decided by the engineer—refused to stay the action. The ground of the decision was that, as the engineer's conduct had been challenged, the matter could not be properly dealt with without his cross-examination, and that it was obviously impossible to allow him to be cross-examined by one of the parties to the arbitration while he was sitting as arbitrator between them. The Court thus refused (on the facts of this particular case) to exercise the discretion given to them by sec. 4 of the Arbitration Act, 1889, to stay the action. But it by no means follows that they would do so in every case in which the engineer of one of the parties to a contract has been appointed arbitrator. Each case would be decided on its own merits.

RAILWAY EMBANKMENT: CULVERT: FLOODING. "Equitas" writes: A certain area is drained into open dykes controlled by Drainage Commissioners. A railway company constructed, some years ago, an embankment crossing one of the main dykes, the drain being carried through the embankment by means of a culvert. It can be proved that the level of this culvert is too high, thereby holding back the drainage and causing waterlogging of the land above. On complaint being made to the railway company, their reply is that the culvert was constructed by them to the approval of the engineers to the Drainage Commissioners. The landowners want to compel the rail-

obliged.

pel the owners to connect to the sewers, although the cesspools may be in good order? (2) Also in a case where house drains are connected to an old sewer (which is to be abandoned) in certain back gardens, can the council compel the owners to disconnect and reconnect to the new sewer in the road—which will

cil carry out the work at the ratepayers' expense?

the new sewers if their drains are sufficient for effectual

tual drainage, the council cannot compel the owners to them-selves close the old sewer, and provide drains con- incurred in the execution of the Public Health Act, 1875. See sec. 24 of that Act.

form me where I could obtain printed forms as used by owners of building estates when letting off plots to lessees? I understand it is customary to adopt a common agreement and covenant throughout.

I do not know where such forms can be obtained. Conditions differ on different estates, and the usual practice is to have form of agreement drafted and settled by the owner's

ADMINISTRATIVE MUNICIPAL WORK AT CLACTON-ON-SEA.

Clacton Urban District Council have had placed before them the final accounts of the construction of

prepared by the council's surveyor, Mr. D. J. Bowe, and tenders for the work were invited in October, 1913. When received, these varied from £14,975 to £19,750, and the surveyor reported that in his opinion they were so high that he could not recommend the council to accept one of them. He subsequently informed the council that he could carry out the whole of the work specified and in the quantities for £11,500, and this, it has now been reported, he was successful in doing, the cost of the work coming out at £11,426. The cost of lighting the pavilion, as well as other work on the greensward—in the way of promenades, flower beds and terraces, costs of loan and other incidental expenses—bring up the total expenditure to £13,000. For this amount the council have received a band pavilion the value of which as tendered for in the open market is nearly £17,000, thus giving ample proof that the decision of the council in asking the surveyor to carry out his scheme by administration was a wise one, not only in the interests of the ratepayers financially, but also from a constructional point of view, the whole of the work being particularly well executed throughout.

The building, which is in the form of an amphitheatre in early Italian Renaissance, has seating accommodation for 4,000 persons, one-half being under cover in inclement weather, and it has, needless to say, formed one of the chief attractions of Clacton's many visitors during the summer.

The congratulations of the Building Committee and council were heartily expressed to Mr. Bowe on the

generally.

London Electricity Supply.—At their meeting on Tuesday the London County Council agreed to proceed to Parliament with the scheme for dealing with

of municipal control with company management.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bexhill T.C. (November 5th. Mr. R. G.

ment of Station-road, and £300 for works of storm-water drainage at Cooden Beach.—The town clerk, Mr. T. E. Rogers, stated that the landowners had agreed to contribute, and the railway company had concurred with the arrangements. No opposition was offered to the proposed loan for storm-water drainage.

Bridgwater R.D.C. (November 6th. Mr. H. S. Stewart).—£1,000 for the purchase of land and the erection of working-class dwellings at Huntspill.—The council, it was stated, were satisfied there was a demand for houses in the district, and it was proposed to erect four dwellings. The rental of the houses would be 4s. 6d. per week. Evidence was given by the surveyor, Mr. W. A. Collins, with respect to the

Bridlington T.C. (November 5th. Major C. E. Norton).—This was an inquiry into the application for a Provisional Order to enable the corporation to acquire and carry on the new spa and gardens, which for nearly twenty years have been in active competition with the Royal Prince's Parade, the property of the municipality. The promenade and concert hall were opened in 1896. Proposals were ripened for improving the resort, but there was a lack of capital, and eventually negotiations were opened with the corporation, who agreed to purchase the undertaking for £16,000. The borough engineer, Mr. Harry W. Smith, said he considered it of importance that the whole of the foreshore (for the purchase of which it is proposed to pay £500) should be in the hands of the town. The present condition of the cliff was not a credit to Bridlington. A well-ordered municipal scheme of treating the foreshore would be much better than a miscellaneous collection of buildings under private ownership. With respect to the purchase of the whole property, he considered £16,000 a reasonable price.

Chorley T.C. (October 28th. Mr. M. K. North).—£4,700 for the reconstruction with granite setts of a portion of Preston, Chorley, and Bolton main road within the borough, and £3,963 for works of private street improvement.—The borough surveyor, Mr. G. H. Hopkinson, in reply to the inspector, said the cost of the upkeep of the main roads in the borough in 1894 was £909. In the present year it was £2,700. In respect to the proposed loan for private improvements, the town clerk said the money was needed for the making up of one street, parts of six streets, and ten back passages.

East Preston R.D.C. (November 4th. Mr. R. G. Hetherington).—£1,000 for sea defence works fronting Rustington sea road.—The surveyor, Mr. W. L. Leney, gave details of the scheme, and explained that it was not one of coast defenece, but for the defence of the road. The sea wall would be a retaining wall for the road.

Holywell R.D.C. (November 3rd. Mr. W. H. Collin).—£13,500 for building working-class dwellings at Mostyn and Bagillt.—It was stated that at Mostyn a site of 3½ acres had been acquired for the sum of £120. On this it was proposed to build twenty-two houses, which would be let at a rental of 4s. 3d. a week, the tenants paying rates. At Bagillt it was stated the intention was to build thirty houses on land which was to be purchased for £635, the extent of the land being 11½ acres.

Llangefni U.D.C. (November 4th. Mr. A. W. Brightmore).—£4,250 for the purchase of the town hall, market halls, and market place.—It was explained that the council's reason for acquiring the property was that they wished to secure the control of the market, which was the main asset of the town, and one of the largest, if not the largest in North Wales.

Pwllheli T.C. (November 5th. Mr. A. W. Brightmore).—£4,000 for the construction of a sea wall parade and road to connect the south beach and west end.—The town clerk, Mr. E. R. Davies, in explaining the scheme, said the development of the town as a seaside resort had been considerably retarded by reason of the two parades being separated for a length of 427 yds. If the repayment of the

£4000 ... [illegible] ... £220.

Sheringham U.D.C. (October 27th. Mr. R. H. Brett ... £900 ... [illegible] ... It appeared from a statement by the surveyor, Mr. F. Hall-Smith, that the ... [illegible] ... and promenade. This sewer is sufficient for ordinary rainfall, but in case of heavy storms the ... overflows.

Swindon T.C. (... 28th. Mr. P. M. Crosthwaite).—£33,000 for the extension of the Rodbourne ... disposal works. It was stated that the Local Government Board ... [illegible] ... soon as possible, and it was explained that, as at the present time the Public Works Loan Board would not lend money excepting for the purpose of finding work for the unemployed, the corporation would have ... [illegible] ... wanted.

APPLICATIONS FOR LOANS.

Barnet U.D.C.—£6,750 for additional workmen's dwellings.

Dartford U.D.C.—£8,930 for the provision of workmen's dwellings, and £1,000 for street widening.

Deptford B.C.—£2,413 for washing baths.

Horbury U.D.C.—£2,27[illegible] for works of sewerage.

Llandudno U.D.C.—£1,500 for water mains.

Margam U.D.C.—£9,703 for a housing scheme.

St. Anne's-on-Sea U.D.C.—£15,038 for building a public hall.

Whitby U.D.C.—£15,471 for the purchase of the saloon grounds and for roadmaking.

LOANS SANCTIONED.

Birstall U.D.C.—£420 for works of sewerage.

Bowland R.D.C.—£2,080 in connection with the sewage disposal works.

Burry Port U.D.C.—£900 for the provision of a public slaughterhouse.

Chailey R.D.C.—£1,300 for a sewerage scheme for Cooksbridge and Hamsey.

Crompton U.D.C.—£276 for the provision of a sewer in connection with the refuse destructor.

Darlaston U.D.C.—£1,760 for street improvement.

Godstone R.D.C.—£560 for drainage works at Lingfield.

Maidstone T.C.—£600 for the purchase of a site for workmen's dwellings.

Tilbury U.D.C.—£36,220 for the provision of workmen's dwellings.

Withernsea U.D.C.—£400 for works of sewerage, subject to the main being laid in and covered with concrete, and £1,420 for the New North-road (provisionally).

Live-saving Collars.—We are informed that every officer and man in the Fleet will be supplied with a new life-saving appliance in the form of a collar which he will carry about with him at all times. The model chosen by the Admiralty is one that folds up into a very small compass. It could easily be carried in the waistcoat pocket, and when necessary might be inflated in a moment. The contractors are delivering these collars with the utmost rapidity. Dexine, Limited, Abbey-lane, Stratford, have received an order for some thousands, and have already delivered large quantities. Although so small, this collar, when inflated, affords a great deal of assistance to a man in the water, and will sustain him as effectively as does a cork lifebelt. Its size is 11 in. in diameter, and it is fitted with a tube and screw valve. The weight is about 4 oz., and it is folded and enclosed in a little case of stockinette material that fastens with a clip.

Costly Roads: Rural Councillors' Suggestions.—At the last meeting of the Midhurst, Sussex, Rural District Council, an informal discussion took place on the question of the cost of the upkeep of the roads. The chairman of the Roads Committee, Mr. Fraser Piggott, said the great question appeared to him to be what material was to be used. The committee's feeling was that under the present traffic it was no use putting on anything but the strongest material. Granite was the cheapest in the end, because it lasted longer than flints. Some of their roads were just as much used as the county roads, and they had a great deal more mileage than they ought to. The Rev. J. A. S. Paget Moffatt said a great expenditure upon roads had arisen since the introduction of the motor. By tarring they had to make a beautiful surface for luxurious motorists. He suggested motors should be abolished, and they should return to the "good old-fashioned horse"—(laughter). To Mr. Aman the idea was uppermost that the "outsider" who used the roads should be made to pay, and as one way of making them he considered it would be a good thing if the old turnpike gates were re-introduced. Mr. J. Mitchell considered the roads were [illegible] ... They were 50 per cent better than roads in other districts, and he suggested lowering their expenditure on them. The better they kept the roads the more traffic they got on them. His views were supported by Mr. G. Knight, who said they could not afford to make themselves a pattern for the rest.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of Surveyor *readers with a view to making information given under this head as complete and accurate as possible.*

The following are among the more important projected works of which particulars appear below:—Buildings.—Dewsbury, Lindsey, Newport, Northumberland, Swansea and seven places.—Margam, Market Bosworth, Rural and Walsall.—Barnoldswick, Exmouth, Hull, Lancaster, Southampton.—Sewerage and sewage disposal.—Worcester.—Water, gas and electricity.—Fifeshire, Longtown.—Particulars of other works projected will be found in our Local Government Board Notices pages.

BUILDINGS.

Bournemouth T.C.—The council have agreed to the proposal of the borough surveyor, Mr. F. W. Lacey, to continue the protective works along the cliffs, a distance of about 500 ft. from the Boscombe Pier approach. Steps are also to be taken for the security of the cliffs in the neighbourhood of the Toft steps, although, it is explained, this would be to some extent in the nature of an experiment, as it was impossible to say whether they would effect a permanent cure.

Derby T.C.—It has been decided to build a tramway shelter at Alvaston, at an estimated cost of £373.

Doncaster T.C.—A scheme is to be promoted for the provision of wash-houses and public baths, including Turkish baths.

Kendal T.C.—It is proposed to carry out structural alterations at the public abattoir, at an estimated cost of £300.

Lindsey C.C.—Plans have been passed for an extension of the Bracebridge Asylum, at an estimated cost of £20,000.

Llantarnam U.D.C.—Tenders are being invited for the erection of a new fire station.

Newport (Mon.) T.C.—It is proposed to erect a bridge across the river at an estimated cost of £78,697. It will be of ferro-concrete, 24 ft. wide, and will be placed alongside the existing bridge to form part of a permanent bridge, which, when completed, will provide a structure 75 ft. wide. In the above estimates the cost of acquiring land and the construction of tramways is not included. The borough engineer, Mr. H. Tremelling, has received instructions to confer with the engineer, Mr. De Vesian, on the subject.

Northumberland C.C.—Plans for a proposed consumptive sanatorium at Woodley are in the hands of the Local Government Board awaiting final approval. The proposal is to accommodate 144 patients, at a cost of £30,000. It is not proposed to proceed with the building at present, but only to put down the foundations and do certain other work.

Penzance T.C.—It has been decided to strengthen the western quay abutting on the dock, and provide store buildings, at an estimated cost of £2,000.

Southampton T.C.—The tender of Mr. I. Nichol, at £3,137, has been accepted for the building of the Portswood branch library.

Southwark B.C.—It has been agreed to erect a coroner's court and mortuary in St. George's churchyard, subject to the Local Government Board sanctioning a loan of £4,800 to meet the cost.

Wednesbury T.C.—The council have under consideration a communication from the Staffordshire County Council, suggesting the formation of a joint isolation hospital area, comprising the authorities of Wednesbury, Willenhall, Darlaston, Heath Town, Wednesfield and Short Heath.

York T.C.—The Health Committee have submitted a recommendation for the purchase of property near Cottingham, for the purpose of a sanatorium.

HOUSING AND TOWN PLANNING.

Margam U.D.C.—The council have approved the scheme of the surveyor, Mr. John Cox, for the erection of forty-seven semi-detached houses at Bryn, at an estimated cost of £9,705.

Market Bosworth R.D.C.—The council have approved a scheme for building workmen's dwellings at Desford, at an estimated cost of £4,630.

Walsall T.C.—It was stated on Monday by the chairman of the Health Committee that action they had taken in the last four years had resulted in 3,000 houses being repaired and 337 closed, of which 286 had been demolished. Upwards of 2,500 houses had been minutely examined under the provisions of the Housing and Town Planning Act.

Worthing T.C.—A statement prepared by the borough surveyor, Mr. F. Roberts, has been submitted, showing the estimated annual expenditure and receipts in respect of a scheme for the erection of sixteen cottages. A sketch plan of the buildings accompanies this statement. The Sanitary Committee have been asked to bring up a scheme for consideration by the council.

PARKS AND OPEN SPACES.

Southgate U.D.C.—An expenditure of £1,750 has been agreed to upon draining, levelling and turfing the cricket field, and forming a bowling green and tennis courts.

ROADS AND MATERIALS.

Barnoldswick U.D.C.—The plans of the surveyor, Mr. W. Ellis, for a new road from Barnoldswick to Stone Trough, have been forwarded to the other local authorities concerned. The scheme is estimated to cost £21,500.

Bradford (Wilts) U.D.C.—The surveyor, Mr. R. B. Lees, reported that he had been to London to see a road dressing which it was claimed did not make the surface of the road slippery, and from what he saw he thought the claim was justified. It did not form a smooth surface on the road like tar, but seemed to penetrate more into the road. It was called "Bracol," and described as a liquid rubber asphalt. He suggested using it in the centre of the town next season, and also in Silver-street, where tar could not be used. The council sanctioned this being done as an experiment.

Bristol T.C.—It has been agreed by the Sanitary Committee to purchase land valued at £550 for the widening of Filton-road. The Road Board have sanctioned a grant of £800 towards the cost of the work, which is approximately £3,500. Property in Rupert-street and St. John's Bridge is to be purchased at a cost of £1,000 for the improvement of Rupert-street.

Buxton R.D.C.—The question of the construction of a new road at Burgsworth is to be the consideration of the council.

Cambridgeshire C.C.—The Finance Committee are considering a supplementary estimate of £1,070 for making up part of Fulbourn-road.

Darlington R.D.C.—Owing to complaints of the slippery state of the tarred roads the council have adopted a resolution urging the county council to leave strips of 4 or 5 ft. at the side of the roads with ordinary macadam wherever practicable.

Exmouth U.D.C.—A scheme has been adopted for the construction of the second section of the Marine Drive, at an estimated cost of £5,000.

Fulham B.C.—The council have agreed with the London County Council to contribute one-third of the cost of widening part of Fulham-road.

Hull T.C.—An extensive scheme of street improvement has been adopted, including a proposal for building 250 workmen's dwellings.

Ilford U.D.C.—Authority is being sought for an expenditure of £36,250 for the improvement of main roads and tramway margins.

Lambeth B.C.—The council last week agreed to take up a loan of £15,000 for paving works.

Middlesex C.C.—A grant of £2,574 has been sanctioned towards the cost of wood paving part of Edgware-road.

Rutland C.C.—The Main Roads Committee reported recently that they had received complaints as to the unsatisfactory condition for horse traffic of the sides of certain roads coated with tar or other similar material, and they were proposing to make arrangements to obviate the inconvenience caused by levelling, as far as possible, the sides of such roads.

Southampton T.C.—The borough engineer, Mr. J. A. Crowther, reported that he had had an interview with the Road Board at which he made suggestions for road strengthening work within the borough at a cost of £12,885 5s. It was probable that the Road Board would make a grant of a third of the amount, £4,295. Another piece of work suggested was an improvement at Hollybank, near Fourposts Hill, involving the purchase of about 350 sq. yds. of land at an estimated cost of £85. Of this sum the Road Board had promised one-third, and negotiations are to be entered into for the purchase of the land.

Stockton T.C.—With the object of providing work the corporation have adopted a scheme of making a new road to improve the connection between the Oxbridge and Hartburn districts at a cost of £1,500, while another road-making scheme is under consideration.

Sunbury U.D.C.—Messrs. Langley & Johnson, of Slough, having intimated their inability to proceed with the contract for road widenings at Charlton, which the council are undertaking on behalf of the Metropolitan Water Board, new tenders were invited, and Messrs. Langley & Johnson presented an amended tender for £12,654, an increase of £565, and this has been accepted. The next lowest was sent in by the Road Maintenance Company, who quoted £12,749, a sum £660 more than their first tender.

Surrey C.C.—It was reported on Tuesday that the Road Board had agreed to subscribe £1,100 towards the cost of the bridge at Pain's Hill, Cobham.—Grants were also made towards a number of improvements on main and assisted roads in the county. In the case of main roads the grant was one-third, and for assisted roads one-fourth of the cost.

Wadebridge U.D.C.—The council have approved plans for the proposed new road from Wadebridge to Ruthern. The length of the new road will be about 3 miles, and it will link up important main road.

Westhampnett R.D.C.—It has been agreed to make an application to the Road Board for a grant to enable the council to carry out the surface-tarring of the Chichester-Bognor road in accordance with an amended estimate of the county surveyor. The council have also approved estimates for the use of 6,352 gallons of tar in the lower district and 4,990 gallons in the upper district during the season 1915, and tenders have been invited for the supply of 11,500 gallons.

SEWERAGE AND SEWAGE DISPOSAL.

Chailey R.D.C.—Specifications and quantities are to be prepared for a sewerage scheme for Cooksbridge and Hamsey.

Cheshunt U.D.C.—By the sale of the sewage farm crops and sundries the council realised £243, against £210 last year, and this although mangolds were lower in price than last year.

Cork R.D.C.—It is proposed to carry out a scheme of drainage for South Douglas-road and district, at an estimated cost of £1,200.

Foleshill R.D.C.—On behalf of the parish of Bedworth, the rural council have entered into an agreement for the purchase of a piece of land for extending Bedworth sewage outfall works. The purchase money is £150, and the expenses amount to over £25.

Hoddesdon U.D.C.—It was reported that the sale of mangolds on the sewage farm realised £54, an average of £8 per acre. This was felt to be very satisfactory.

Leyton U.D.C.—The council have made arrangements with Ames-Crosta Sanitary Engineering Company, Limited, of Nottingham (sole licensees), to instal another patent "Fieldhouse" sedimentation tank of 500,000 gallons capacity.

Wakefield R.D.C.—It has been decided to carry out a drainage scheme for the Horserace end of Heath Common.

Westhoughton U.D.C.—The tender of Ames-Crosta Sanitary Engineering Company, Limited, of Nottingham, has been accepted for the supply of three 70-ft. diameter patent "Simplex" rotary sprinklers.

Witham (Essex) U.D.C.—The surveyor, Mr. P. Perkins, reports that the sale of the mangold and kohlrabi grown on the sewage farm yielded £119, compared with £168 last year. The acreage was the same as before, but the crop was smaller.

Worcester T.C.—The council have authorised the committee having charge of the sewage disposal system to visit the works at Birmingham, Guildford and Withington, with a view to deciding upon an improved system of sewage works.

WATER, GAS, AND ELECTRICITY.

Coleraine U.D.C.—The question is under consideration of constructing a covered storage tank at the Ballyversal waterworks.

Doncaster R.D.C.—It was reported on Tuesday that a letter had been received from the town clerk of Leeds regretting that, in view of the delay of the council in coming to a decision on the matter, it is impossible for the Leeds Corporation to proceed further in the matter of a water supply to the Doncaster district in the next session of Parliament.

Fifeshire C.C.—It has been agreed by the Vale of Leven District Committee to carry out a scheme for the improvement of the local water supply, at an estimated cost of £8,750.

Leyland U.D.C.—A new distributing main is to be provided, at an estimated cost of £600.

Longtown R.D.C.—Having been urged by the Cumberland County Council to consider the question of a water supply for Bolton Fell and district, the rural district council have decided to request Sir Richard Graham to give them his terms for water.

Newmill U.D.C.—Plans have been passed for a new reservoir at Goose Holes, estimated to cost £5,200. The work will be carried out under the direction of Messrs. Marriott, Son & Shaw, engineers.

Rhyl U.D.C.—In view of the differences between the Rhyl Council and the St. Asaph (Denbigh) Rural District Council, the Local Government Board suggest a conference of representatives of both bodies, presided over by one of the engineering inspectors of the board, in order to discuss the existing conditions of the water supply to Llanddulas. Both councils have agreed to the suggestion.

St. Just U.D.C.—With respect to the proposed water supply scheme, the Local Government Board have written that, having regard to the risk of the supply being intercepted by the operations of the china clay syndicate, it would be desirable that the council should adopt a different scheme.

Southwark B.C.—The Electric Light Committee in a report on the accounts of the electric light undertaking state that the year's working showed a nett loss of a little over £1,600, which was attributable to various causes, among which were the increase in the cost of coal, £393; removal of ashes, £244; increase in the sinking fund, £690; and repairs and maintenance, £165; in addition to which might be added the interruption in the economical working of the station during the progress of the installation of the new plant.

Teddington U.D.C.—On Monday it was decided to obtain tenders for the electric lighting at the sewage disposal works, and to complete the scheme as approved by the Local Government Board.

Thakeham R.D.C.—Tenders are to be obtained for works of water supply at Storrington, which are estimated to cost £5,172.

Torpoint U.D.C.—With regard to the matters referred to arbitration in connection with electric light, the award was favourable to the council on every point. At the request of the Electric Light Company, it was decided to meet them to discuss the question of entering into an agreement with regard to private lighting.

Wellington U.D.C.—Owing to a shortage in the water supply it has been resolved to provide forthwith a second borehole and pumping machinery, and that expert advice as to the most suitable position for the borehole be obtained.

MISCELLANEOUS.

Brighton T.C.—With respect to the proposed trackless trolley omnibuses between Hove and Brighton, for which powers have been obtained, the Brighton Corporation have agreed that the Hove Corporation should be informed that the Brighton Council were unable to agree to the adoption of the over-running system, and that unless the Hove Corporation agreed forthwith to adopt the under-running system, application would be made for the Local Government Board to appoint an arbitrator.

Dawlish U.D.C.—The surveyor, Mr. S. F. C. Churchward, has submitted a plan for the erection of a miniature rifle range at the Knowle on less costly

[illegible] than that originally proposed. He estimated that the new scheme would be carried out for £1,450. It was decided to defer consideration of the matter until the Local Government Board's reply to the council's communication to them on the subject has been received.

Hampton U.D.C.—It was decided on Tuesday to pay half-wages to employees who have joined His Majesty's Forces.

Teddington U.D.C.—On Monday it was decided to [illegible] the engine with a view to its sale, to [illegible] it, and to apply to the Local Government Board for sanction to a loan to defray the cost.

Torpoint U.D.C.—A recommendation of the Highways Committee that the council's employees' wages be increased 1s. per man's by 2s. per week and the [illegible] rate to 5½d. per hour has been adopted.

PERSONAL.

Mr. F. D. Tann, [illegible], assistant borough surveyor of Dewsbury, has had his salary raised from £175 to £200 a year.

Mr. Pearce, a member of the surveyor's staff, has been appointed assistant surveyor to the Sedgefield Rural District Council, at a salary of £104, rising to £130.

Mr. F. Britton, surveyor to the Dore Rural District Council, has been appointed surveyor to the Hereford Rural District Council, at a salary of £150, rising to £160.

Mr. D. Elliott, of Bloomfield, Belfast, has been appointed assistant surveyor for portions of Ballymoney and Antrim rural districts under the Antrim County Council.
